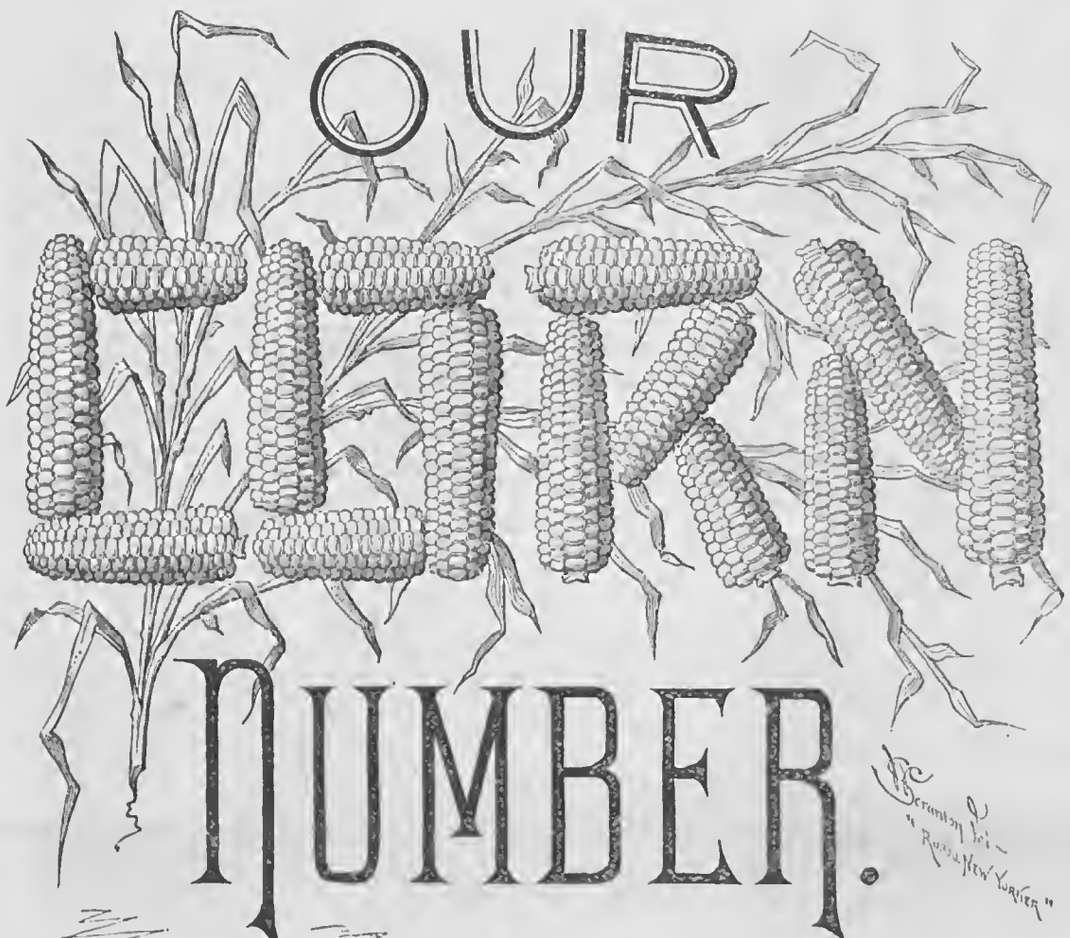
THE
RURAL NEW-YORKER
A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

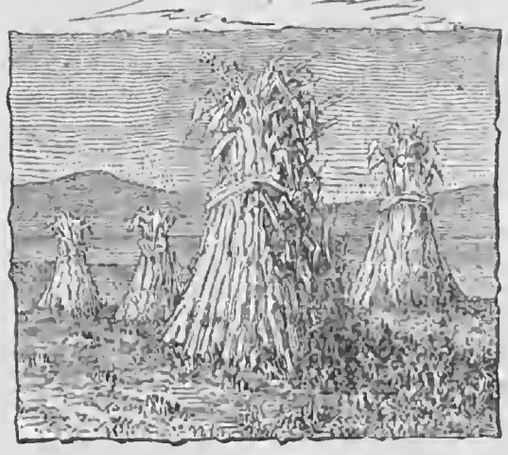
VOL. XXXIX. No. 1.
WHOLE No. 1614.

NEW YORK, JAN. 1, 1881.

PRICE FIVE CENTS.
$2.00 PER YEAR.

[Entered according to Act of Congress, in the year 1880, by the Rural New-Yorker, in the office of the Librarian of Congress at Washington.]





Corn Report from the Rural Farm.

CHESTER COUNTY MAMMOTH.

The Rural's estimate of the yield for the best acre too small!

BLOUNT'S WHITE PROLIFIC.

The Rural's estimated yield too high.

Probably the best well-authenticated Yields of Indian Corn on Record without Farm Manure, and at so Small a Cost

The Faults and Merits of the two Varieties:

A Fine Yield of Yellow Flint without any Manure, planted not until June 10.

THE WHOLE STORY TOLD.

The "Wild Corn of America."

Engravings from Nature.

NOTES FROM THE RURAL FARM,

JANUARY 1st, 1881.

The field upon which the Chester Co. Mammoth was produced, we have always considered, as has been before stated, one of the poorest of this farm. It had been lying idle for about fourteen years. We say "idle" because during that period—at least the middle and latter part of it—it has been used as a thoroughfare to and from all parts of the farm, for cattle, teams and men, running lengthwise, as it does of the dwelling, farm, buildings, garden, &c. The soil had become very hard, and where it was not quite bare gave a stunted growth of grass, daisies and weeds generally. It was in fact an eyesore, and it was plowed up and prepared for corn less for the crop than to cover it up from ourselves and our visitors, many of whom were impressed unfavorably with the entire farm, from seeing this first, as necessarily they must.

THE LAND is very gravelly, high, and naturally well-drained, except in the eastern part toward which it slopes, there forming a little valley, which could only be drained at an expense greater than the improvement would be worth.

The field contains over five acres, upon four of which the Chester Corn was grown. It was plowed in early May, except about an acre of the west part, which being nearly a solid bed of white weeds—daisies (Leucanthemum vulgare) was previously plowed in August of 1879, while the daisies were in fullest bloom. It was harrowed once with La Dow's Pulverizing Clod Crusher, and again with a straight iron tooth harrow, 350 lbs., of concentrated fertilizer (Mapes's corn manure), having been mixed with double its bulk of earth and sown broadcast before the last harrowing. No farm manure was used. The field was marked out with a shallow plow, the marks running from three and a half to four feet, or an average of perhaps three and three quarters feet apart. The planting was begun and finished May 15th. We used the Hoosier Corn Drill, which dropped a grain about every 16 inches, covering it an inch deep. With this implement it takes less than twice as long to *plant* a field as it does to *harrow* it. A shaft may be connected with any one of three rows of cogs upon the wheel, the outer row of which adjusts the machine so that it will drop a kernel, not accurately, of course, every 12 inches—the middle one every 16 inches and the inner one 20 inches. We used the middle row of cogs, though another season we should try the outer row. Indeed it may be questioned whether it would not insure a more even stand and provide against the many disadvantages of a second planting if the machine were to drop a grain every six inches or less. Then at the first hoeing every other plant could readily be cut out when every grain germinated, leaving the plants 12 inches (more or less) apart; while all could remain where alternate or occasional failures occurred.

The seed germinated poorly for some reason which we did not understand, laps of from five to fifteen feet occurring in many parts of the field, so that a second planting was necessary. This on account of a severe drought, which by that time was well under way, proved quite ineffectual to fill up the gaps caused by the first failures. The *stand*, therefore, was one which gave no sign of an abundant harvest. As we did not consider this an experiment field or crop at all, we have no reliable data as to when or how often it was cultivated. According to the writer's memory, refreshed by consulting with our farm hands, it was cultivated twice and hoed thrice. The cultivator used is a late invention, which, being unworthy of much praise, is sufficiently shown by the accompanying cut, fig. 4. It, however, stirred the ground pretty thoroughly for two or three inches in depth, leaving it somewhat raised or oval in the middle, and correspondingly lower towards the rows of corn. This was leveled by hoeing.

THE WEATHER was dry during late May and June. During early July a good deal of fodder corn became so shriveled on many farms that it did not recover. The leaves of the Chester curled considerably, and we supposed that the crop would be seriously injured. It appears, however, that the season, taken from beginning to end, could scarcely have been more favorable for the corn-fields of Long Island. During August high winds broke off or lodged a few stalks here and there. In early September also, a heavy storm of rain and wind harmed the corn measurably. But such storms always occur, and they were no more destructive last than in the average season.

When this corn was in silk the field was beautiful to look upon. It was then apparent that the yield would be immense, and many of our visitors and the neighboring farmers freely expressed themselves that they had never seen anything like it.

THE CHESTER CORN plant grows nearly as tall as the Blount, and the stalks are much larger. Generally, each stalk bears one ear. Possibly as many as one stalk in fifteen bears two ears. Occasionally three ears are found, and in the entire field there were three or four stalks with four ears each. But these ears do not, as in many kinds of Dent corn, proceed from different joints. As shown in the engraving (fig. 3), they are clustered together at a single joint. Evidently it is not therefore desirable to attempt by selection to fix or cultivate this habit. The ears crowd each other, and instead of one large perfect ear, we have several imperfect ears. We have selected seed from the multiple ears, it is true, for experiment on a small scale, but the bulk of our seed has been selected from the heaviest and finest. Our engraving of the ear of Chester Corn (fig. 2) is from life, and it is by no means the largest that could have been selected. There were scores as good. It fairly represents an *average* of the *best* ears.

This variety may be described as varying from 14 to 34 rows—the average being about 18. Its form is sufficiently shown in the engraving which may be accepted as typical. Each row will average 50 kernels so that the average ear will contain about 900 kernels. The kernels are deep—the color of Yellow Flint below and of a light buff on the top which is much dented.

THE FAULTS of this variety are that it grows too tall—the stalks are too thick and the ears are borne too high. It would also be desirable if its season of ripening could be made a little earlier, as no doubt it can.

The shorter of the Chester ears is one of 30 rows. These are occasionaly met with—always losing more in length of ear and size of kernel that they add by the greater number of rows. We found two ears with 34 rows, but they were less perfect than the one shown—fig. 1, which is a true portrait.

The Yield of Chester Co. Mammoth Corn.

It will have been observed that a portion of the west part of this field was plowed in August 1879, for the purpose of subduing daisies. It was upon this portion that the yield was heaviest and it was there that Mr. Bruggerhoff (J. M. Thorburn & Co.) by having stooks husked here and there, based his estimate of 300 bushels of *perfect ears* per acre for the entire field. This estimate, though within the truth for the *best* acre, was too high for the entire field as will be seen. The committee consisting of Robert J. Dodge (Pres't. Farmers' Club, Am. Institute), W. M. Habirshaw, F. C. S. (Chemist, N. Y. Ag. Soc.), L. C. Benedict (Ag. Ed. N. Y. World), confined their inquiry to the *middle* portion of the field which, by careful measurement of one acre of land and five stooks husked in different parts yielded according to their certificate 236 bushels of ears per acre. We have since ascertained that a third acre yielded about 200 bushels of ears and the fourth acre—that which is not well drained—about 120 bushels of ears—making in all 856 bushels of ears upon the four acres. Shelled Nov. 10 we found an average bushel of ears to make just 17 quarts of grain. It may therefore be said that the best acre yielded 159.37 bushels of shelled corn. The next best acre yielded 125 37 bushels. The next 106.24—the poorest 63.75 bushels and the entire field 113 69 bushels of shelled corn per acre. The yield (856 bushels) was carefully measured by our farm manager as it was placed in the cribs. The expense of producing this yield of corn, it must be seen, is exceptionally small. The items of labor and manure are as follows:

Taxes and interest on land value	——
Plowing. Two horses and man—say two days.	——
Harrowing twice. " " " two "	——
Planting, cultiving twice. One horse " three "	——
Hoed three times. One man " 12 "	——
Manure, 350 pounds per acre $800.	——
Cutting, husking, etc.	——

The Blount Corn.

For the information of our many new readers, we may briefly state that Blount's corn (purchased from Prof. A. E. Blount the originator, now of Col. State Coll.) was one kind offered in our Free Plant and Seed Distribution of 1878. From this seed we planted in 1879 a measured quarter of an acre and though the plot was badly selected—though a late frost killed a portion, eighteen bushels of shelled grain (72 per acre) were harvested therefrom. Our seed for last season's planting was saved from such stalks only as bore four ears or more. That part of the field given to it measured (we take Mr. Dodge's measurement) 310 feet by 122 4 feet, or .87 or within a fraction of seven-eighths of an acre.

It had been in grass (mostly Couch, Quitch or Quack of late years) for seven years. It was plowed in late Fall and in early May, the new cultivator (see illustration) was used to cut off the "Quack" which was already growing finely. Then it was harrowed with the "Clod Crusher" (LaDow's), again with the iron-tooth and the drills marked four feet three inches apart; 300 pounds of the same concentrated corn fretilizer were sown broadcast before the last harrowing; 100 pounds of the same when the corn was about six inches high, and 100 pounds of concentrated potato fertilizer when it was about 18 inches high. In other respects the treatment of this field was the same as the Chester. That is to say it was cultivated twice with the same cultivator and hoed three times, always hoeing flat so that there was not the slightest appearance of a hill about the base of the stalk. It was our wish to have given it at least two other hoeings and we endeavored so to do. But just when labor is most needed upon this farm, it cannot be had and our most cherished experiments have often come to naught because we were prevented from giving that careful attention to every detail without which an experiment is of no value whatever, except it may be to those free-and easy people who deem it time and labor thrown away to obtain *exact*

results when they may in the main be *guessed* at. The soil of the Blount field is a sandy loam—somewhat gravelly but not so much so as the Chester.

THE EAR of the Blount corn varies (not to speak of nubbins) from seven to nine inches in length and from eight to fourteen rows and from 40 to 50 kernels in the row. [An engraving of an average ear and cob of Blount's was was presented March 8, 1879.—EDS.] We think the average ear would not contain over 450 kernels. They are white—less dented than those of Chester, not so deep and wider at the top or more wedge-shaped. If they were as large at the bottom, it would be necessary for them to have a thicker cob to stand upon.

THE BLOUNT CORN PLANT in 1879 grew a full foot taller and required at *least* two weeks longer to mature than in 1880. Its hight last season averaged between 10 and 11 feet. In many plants the disposition is shown to form an ear at every joint. "Sets," indeed, often appeared at every joint, but the lower ones made no growth or development. The greatest number of ears found upon any plant was 10. Upon several stalks in this field eight were found, though the lower ones were often nubbins. We should judge from an estimate, though not an exact one, that *each* stalk would average not less than two and a half perfect ears. Upon some stalks the sets, instead of developing into ears, would remain dormant, while the ear stalk, or "shank," would grow into stalks, so that the plant would become branching, spreading and sterile. Sometimes ears would develop near the ends of these branches; but the weight of the ears would always break them (the branches) down before the corn had ripened.

FAULTS OF THE BLOUNT.—It can hardly be deemed a fault in this variety that the ears average small, since it is evident that the corn plant has not strength to support two or more very large ears. The stalks are very strong and the ears generally grow from opposite nodes in a manner to balance each other, though rather high up. The tips of the ears are rarely covered. The "shanks," or earstalks, are often long, as we have said, though we are satisfied that this objection could soon be bred out. As in the Chester, the perfect ears grow too high up. The stalks grow too high by a foot at least. In 1879 the season was scarcely long enough for it to mature. Last season it had two weeks to spare. It should not be overlooked, however, that '79 was as unfavorable as '80 was the reverse.

The Yield.

As our old readers are aware, several committees of eminent agriculturists made it their business to carefully investigate the yield of this field. Huskers were ready to do their bidding. The field was measured on three different occasions. Stooks were selected and husked at the bidding of the committees. The highest estimate thus formed was 150 bushels of shelled corn to the acre; the lowest, as we remember, 132. The actual yield, however, proves to be nearer the latter, viz., 134.44 bushels of shelled corn per acre, as estimated from measurements completed December 5th, when the last of the corn was cribbed.

MEMORANDA.—A bushel of ears of Blount weighs 35 pounds and gives 17.5 quarts of grain, weighing 28.99 pounds, the cobs weighing 6.01 pounds. The Chester bushel of ears weighs 35 pounds also, making 17.0 quarts of grain, weighing 28 pounds. The cobs weigh seven pounds.

A Remarkable Yield under the Circumstances.

Some of our readers will attribute the above immense yields to one thing—some to another. The favorable season was one element of success, but not the chief one, because many good farmers hereabouts, upon land fully as fertile, naturally, and highly manured, raised less than 75 bushels to the acre. The method of planting and cultivating was no doubt another element of success. The variety of corn planted was another element, and possibly the special fertilizer used still another. But undue prominence must not be awarded to either the variety or the concentrated fertilizers as we now proceed to show.

In another part of the same field upon which the Blount was grown we had determined to raise a crop of Minnesota Early Amber cane, with which to experiment in making sirup and sugar. The seed was sown, but as it was slow to germinate, having been covered too deeply, the "Quack" grass grew to such a hight that we concluded, though late (June 9) to again plow the field and plant corn. This was accordingly done. It was again harrowed twice, the rows marked off *three and a half* feet apart, and, as with the Chester and Blount, the seed drilled in June 10. It was then *rolled* with a heavy iron roller. The variety here planted was the common 8-12 rowed Yellow Flint. It must be noted that no manure of *any* kind was used. The plot measured .733 of an acre or .03 over seven-tenths of an acre. From this plot we have gathered 105¼ bushels of ears, which is at the rate of over 143 (143.16) bushels of ears per acre. We find, however, that a bushel of ears of this variety of corn makes (averages) but 31 pints of grain. The yield of grain per bushel of ears therefore would fall short as compared with either of the others, and the yield of shelled corn per acre would be 69⅓ (69.34).*

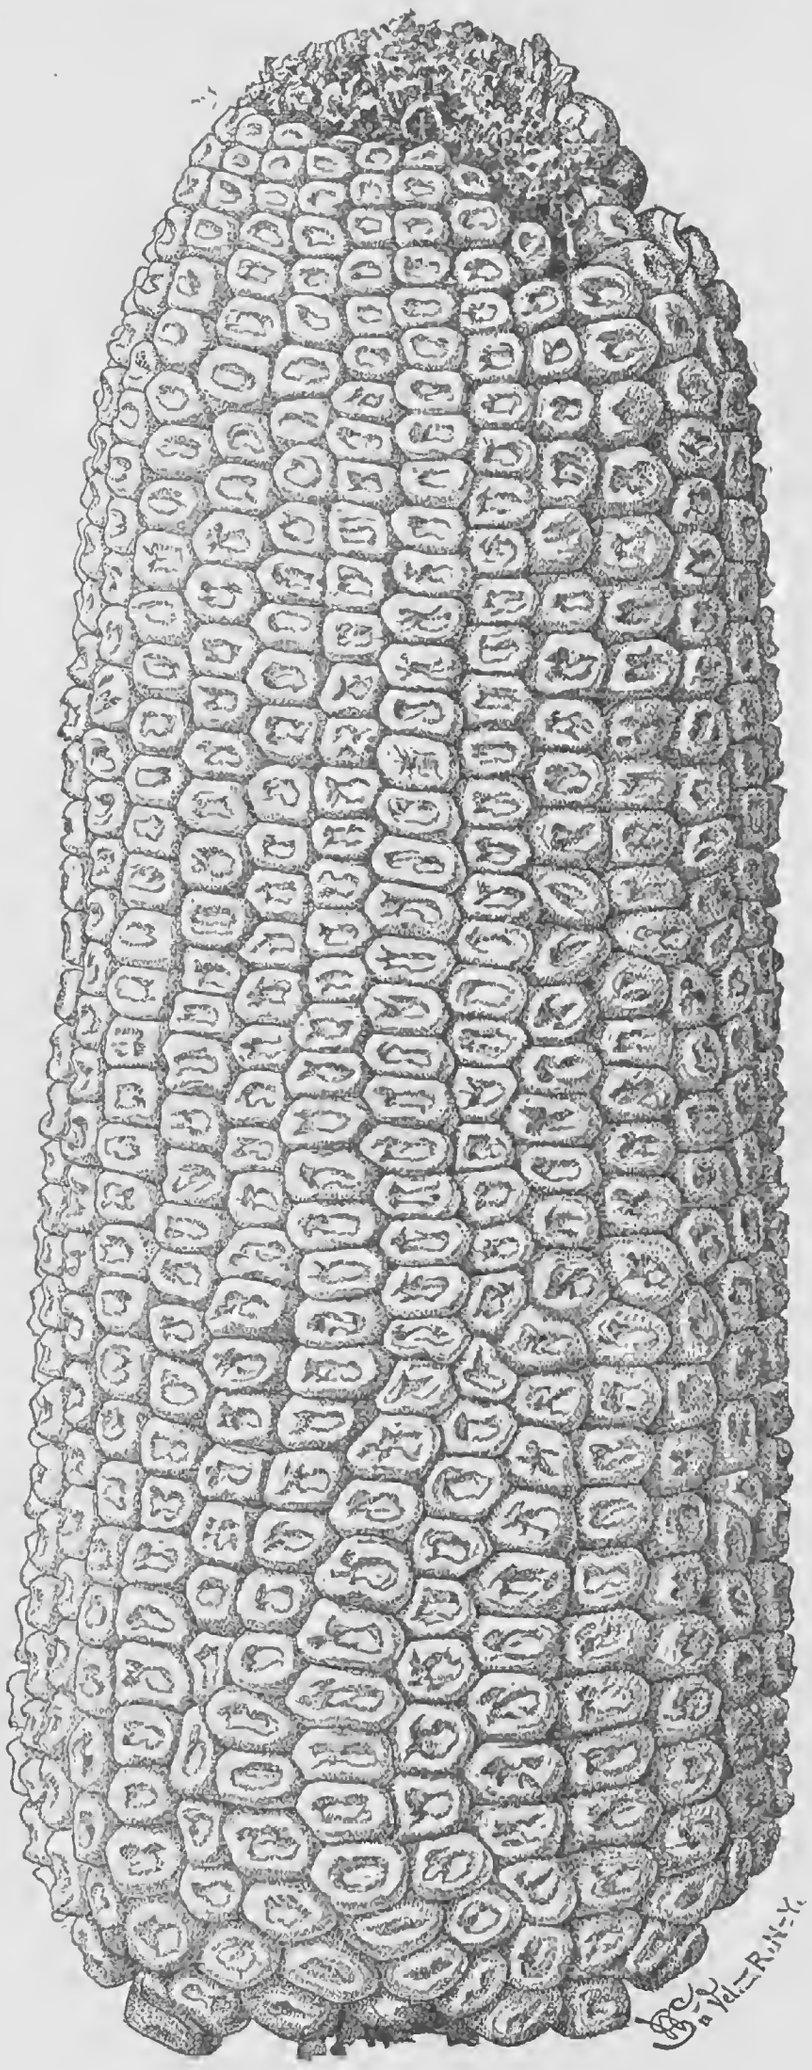
Here we have an unusually fine crop of corn planted not until June 10th, without any manure. To what was it due? To a very favorable season chiefly? We think not. Many crops of corn have been raised hereabouts the past season, some of them highly manured—some not. One field, indeed, of three and a half acres received 1 200 pounds to the acre of Lister's ammoniated bone phosphate, besides a "handful to the hill." Another field received 25 loads per acre of farm manure of an excellent quality and a handful of phosphate to the hill. These two fields are situated similarly to ours and the soil of either cannot be distinguished from the other by the sight or by handling. The corn is planted in hills usually four feet apart—four kernels to the hill. Very little hoeing is done, the plow or two-horse cultivator being relied upon to keep down the weeds. Not one of these fields has yielded a hundred bushels of shelled corn and few of them seventy-five.

Well, we must not, therefore, good readers, credit too much to the season or to the manure, as many of us are prone to do. The expression that a given quantity or kind of manure or fertilizer gave a certain yield is used too often. We are satisfied that in a given season and crop little is known how much or how little is due to any one factor. Granting, however, a fair percentage of credit to the favorable season and to the concentrated fertilizer in the case of the Blount and Chester, the following items remain to be considered:

Thorough Preparation of the Land.
Variety of Seed.
Drilling in the Seed.
Flat Cultivation
The Preservation of a Mellow Surface and the Timely Destruction of Weeds.
No Interference with the Roots of Corn by plowing or otherwise.

We hope, life spared, to prove to our friends that the Rural Farm can raise as large a crop of corn in 1881 as it did in 1880.

*One bushel of ears of this Yellow Flint weighs 34½ pounds, making 31 pints of grain weighing 27 pounds.



CHESTER CO. MAMMOTH—30 ROWS.—FIG. 1.

"The Wild Corn of America"

IN the RURAL NEW-YORKER of March 3rd, 1877, an engraving appeared of what is variously known as Wild Californian or Oregon Corn, Rocky Mountain Corn, Texas Wild Corn, Cow Corn, Corn in pods, etc. By whatever name it is known here or there, it is generally looked upon as the Wild Corn of America. Each kernel is enclosed in a covering or husk of its own, the same as the kernels of wheat or oats are enclosed. But the entire ear is enveloped in a husk the same as other corn. Whether this is the original type of the many kinds of corn now known need not here be discussed. In fact, mere speculation would not aid us in determining anything one way or the other. We desire here to speak of the tassel which this "Podded" Corn plant bears, a true representation of which reduced one-half in size (to save space) is herewith presented (p. 5). Generally in the sorts of Indian Corn now cultivated, the tassel is the male organ furnishing the pollen for the pistils (silk) of the female flowers beneath. Occasionally, however, female flowers appear upon the tassel and hence we sometimes find thereupon scattered kernels or more or less imperfect ears. Last season we raised a small quantity of this "Podded Corn at the Rural Farm, merely as a matter of curiosity, for, though it may be the "Wild Corn of America," most of our visitors had never before seen it and were, therefore, greatly interested in its peculiarities. The tassels of this corn, instead of being composed of male flowers only, as is generally the case with other kinds, bore more females than males—or at least, as many, and these are pretty regularly distributed throughout the panicle. So far as we have observed the flowers are never *perfect*, *i. e.*, possessed of both stamens and pistils, and Professor Beal, who examined several fruits from one of these spikelets under a glass, was unable to distinguish even the rudiments of stamens. The disposition on the part of the corn plant to produce not only females among the males (as shown in the tassel), but males among the females is shown in figure 5, which is an ear of Blount's Corn, and an accurate drawing from life. Here, it will be seen, we have first a normal growth of ear which abruptly changes to male flowers. Then there are several kernels, and finally the resumption of the ear, which is again in every way similar to the corresponding part of other ears. Many of our fruits are shaped by pressure. It is so with corn. Whenever the pressure does not exist, the kernel assumes a round shape. This may be seen in the kernels upon the "tips" of ears where they are less crowded. The kernels of the tassels of the "Pod" (as we may call it for short), corn are quite round as shown at fig. 7, in the engraving and are of the *natural* size. A very interesting experiment would be to select (as we have done,) kernels from these tassels and plant them year after year with the view of ascertaining what form they would gradually assume. Would they lose the pod? Would the tassel become exclusively male, as in other kinds? Would they gradually assume the appearance and characteristics of the corn at present cultivated? In such experiments, it would be necessary to keep the plants away from contact with foreign pollen. In this way a few years would probably suffice to determine whether or not this "Pod" corn is, or is not, the original Zea Mays.

[*As is well known to old subscribers, it has been our custom during several years past to issue* SPECIAL NUMBERS *of the* RURAL NEW-YORKER. *The present is our second number, especially devoted to* INDIAN CORN. *The next special will be devoted to those Hardy Shrubs and Trees which are best suited to the Rural Home. The third Special will treat of Strawberries, &c.—the best of the new and old varieties with original illustrations from nature. The fourth Special will be devoted to Wheats—new hybrids—rare varieties—the best yielders. Seventy-seven different kinds of wheat are now growing on the Experiment Farm of the* RURAL NEW-YORKER. *Several of those which have originated there are being raised for the purpose of free distribution among our subscribers.*]

THE ESSENTIALS FOR A CORN CROP ON THE ILLINOIS PRAIRIES.

B. F. JOHNSON.

THE following facts in respect to Indian Corn Cultivation are gathered from twenty-five years' observation and experience on the black soil prairie of Illinois, in about North latitude 40 deg., or near the parallel of Columbus, Ohio, and Springfield, Ill. The crops were first made on a virgin soil and have been continued to this time, and the details, unless otherwise noted, refer to making them without manures or fertilizers of any kind. And another explanation which perhaps should be made is that in order to obtain the best crop, it is necessary to modify the practice as the soil acquires age and becomes more or less partially exhausted. Thus when the soil is new, one certain treatment makes the best crops; after four or five years this requires to be changed, at the end of ten years other changes must be adopted; until finally, when the soil has arrived at the stage of impoverishment common to the land in the early settled timber States, the best methods and practices are found to be nearly identical with those common there. Therefore let it be understood, that what is here set down applies to black prairie soils which have been cropped from ten to fifteen years, as the present representative corn crop of the country, avoiding an account of the *minimum* of cultivation which produces the largest crops on fresh soils, and the *maximum* which brings about results nearly equally satisfactory, on lands which have been cropped for nearly half a century.

But the essentials for a good corn crop on the black soil prairie, are neither many nor difficult to be attained and are pretty much confined to the following points—a strong, rich soil, a good seed bed, a full stand, an early start and thereafter sufficient cultivation. These embrace the details of 1, plowing and soil preparation, 2, planting and seed, and 3, timely and sufficient cultivation.

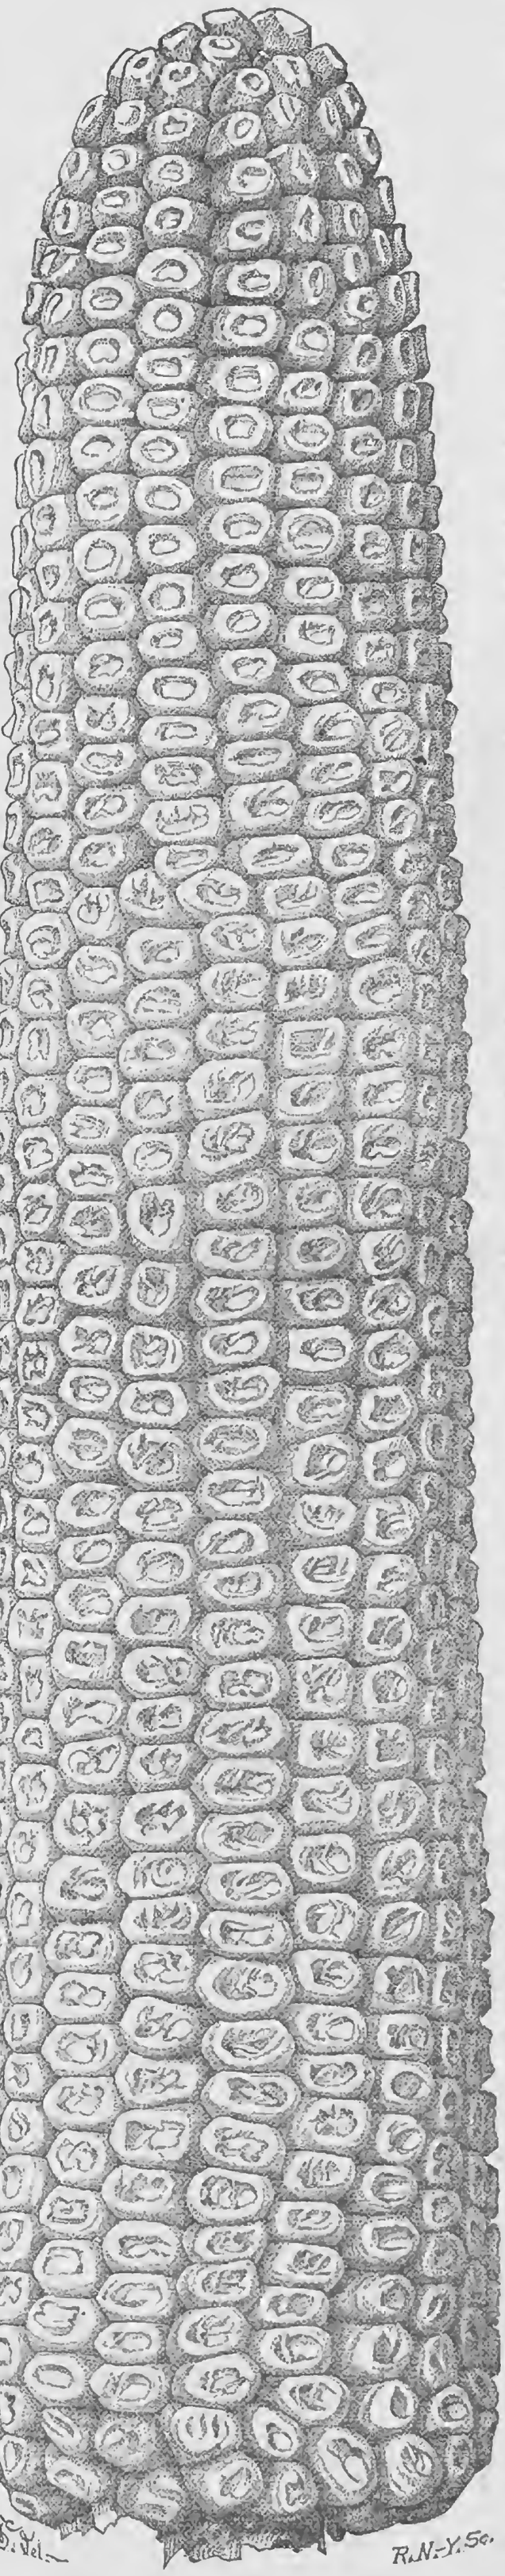
PLOWING AND SOIL PREPARATION.—In the case of a wheat or an oat stubble, or a Timothy or Blue Grass sod, the land should invaria-

bly be plowed in the Fall, deeply if previous plowings have been shallow, but rarely more than five or six inches. And where corn follows corn, as the too common custom is, where possible, the corn should be husked, the stalks broken down and turned under in the Fall or Winter months, because, over and above the advantage of doing Spring work in advance and removing part of the small pressure on the seed-time season, turning under stubbles or swards of any and all kinds allows of that decomposition and decay to take place, and time for that action and reaction in the raw materials for plant food, which are essential to full crops sown on the best soils. So in the case of where manures and fertilizers are to be used, these should be put upon the land some months before the crop is planted. This is a new but a clearly demonstrable view of the true use of manures as fertilizers. If the plowing of corn stubble is deferred till Spring, because of the lateness of the corn harvest, care should be taken to break the stubbles off even with the ground while it is yet hard frozen, using a 15 or 20 foot bar of railroad iron for the purpose, managed with a pair of horses attached to either end. The stalks should then be raked into rows and burned, though the better practice is to turn the stalks under by the three-horse sulky or the 16-inch common plow; because, though the depth of the furrow necessary to cover the stubble would probably lessen the crop immediately following, the addition of the vegetable matter will benefit the land over and above the loss on the current year's crop. Spring plowing should also be done as early as possible, in order to have the soil lay and be compacted, as well as to admit of a partial preparation of these crude elements of plant food which have been turned under, and which, until they find their way back near the surface, are out of the way of the feeding roots. There never was a greater error than the common practice which demands that corn and wheat land should be seeded immediately after being turned up with the plow, the assumption being that seeds germinate best when placed in an open, porous, cool and fresh seed bed.

PLANTING AND SEED.—Seeding time having arrived, which varies from the 15th of April to the 10th of May for latitude 40 deg. the corn crop land should be entered upon and given a thorough going over with a double shovel, or better with a heavy, long and sharp-toothed harrow, in order to destroy the weeds which start early and to prepare a fine and tilthy seed-bed; but in no case should the soil be disturbed to a greater depth than three or four inches. For doing this work the new revolving disk-harrow, answers an excellent purpose, which drawn by three or four stout mules or horses, hitched abreast, will cut a furrow from twelve to fifteen feet wide and go over from 20 to 25 acres in a day. And let it be repeated here as an essential thing, that in doing the second plowing, stirring or fining of the fallow, no attempt should be made to turn the surface under; because in the case of fall plowed land the elements of plant food are just where they are needed, and in the case of spring plowed, the three or four weeks, intervening between plowing and seeding have allowed the same fertilizing causes to operate in a less measure.

The surface having been fined the land is now ready for the seed which should be drilled in with the common planter, the rows standing apart three feet eight inches to four feet, and the stalks singly, in the row distance from eight to twelve inches, according to the variety of corn, the strength of the land, and the purposes for which the crop is to be used. If the land is foul and rows both ways are needed, so as to admit of cultivation in transverse directions, the hills should stand from three and a half feet to four and with not less than two nor more than three stalks in a hill. Where corn is grown to be fed from the shock and small ears and an increased amount of forage is desirable, the distance between the rows and the hills both may be considerably lessened. The two great errors in this portion of the work of maturing the corn crop, and they are not these alone, but these are vices, are in the first place, deferring the time of seeding one or two weeks, and second, the use of too much seed. The first arises from the bad habit of Spring plowing, which frequently does not admit of the land being entered upon till late in the season, and the second from a want of faith in the seed. Given Fall plowing, early seeding, and perfectly sound seed and land having complete natural or artificial draining, the corn crop of the black soil counties has never been known to fail.

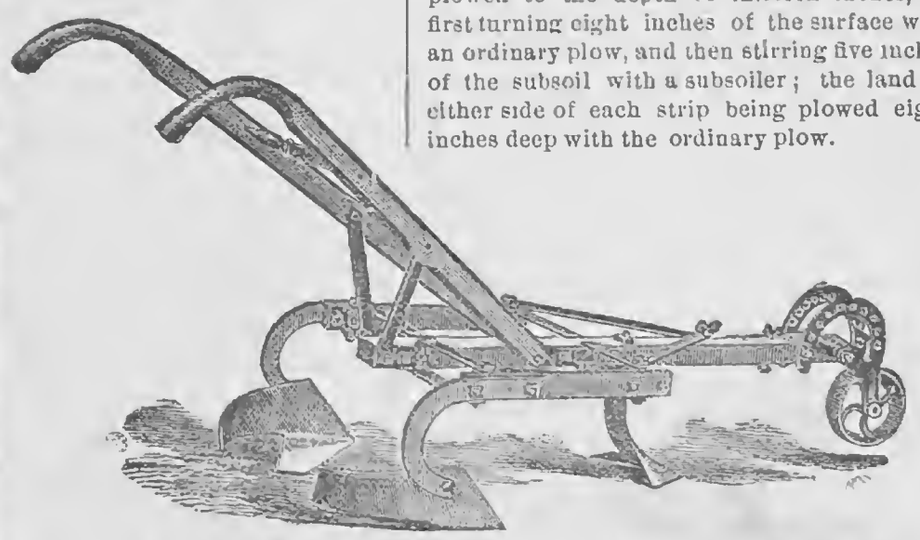
But in this connection and in so vital a matter, the subject of seed corn deserves some attention. One peculiarity of seed corn is (and probably the same is true of most seeds), that a given lot may be sound enough and good enough to germinate to the last kernel, when all the conditions are favorable—heat, moisture and the like—and fail to grow when the conditions are of an opposite character. Thoroughly good and sound seed will, if planted a little too early, or when the earth is too cold, or too dry, or too wet, retain its vitality and start when the conditions have become favorable. Such seed corn is only readily obtainable in good corn ripening seasons, unless care is taken to select the ears from the field before sharp frosts come, truss them up by the husks and suspend them where it is airy, warm and dry—and the dryer and warmer the better—provided the temperature does not get above 125 or 130 degrees, because it has been demonstrated again and again that no common treatment preserves or perhaps develops the vitality of the seed corn germ like long exposure to a high and dry temperature. While it is a common thing for wheat and oats exposed on the ground during the Winter months to make a volunteer growth in the Spring, corn does so not oftener than once in four or five years, that is, in very favorable corn crop years, which in the afterpart are always seasons of considerable heat and drought.



CHESTER CO., MAMMOTH.
AN AVERAGE OF THE BEST EARS.—FIG. 2.

Planting having been accomplished if the season is droughty, the soil dry and inclined to be cloddy, the corn field should have a heavy roller put over it, although the best corn planters, like the best wheat drills, pack the soil over the seed. After rolling, or as soon as the springing corn shows along the furrows, the field should be thoroughly harrowed in both directions, which no fear of injuring the springing corn should prevent. Indeed, no matter how heavy the harrow may be, if the teeth are only slim and sharp, the field may be gone over half a dozen times without displacing one shoot or one kernel in a thousand. In case the land is dry, the roller should follow the harrow, and just as soon as the stand is fairly full, the plow should be set again and kept going till the weeds are subdued, or until the corn growth so shades the soil that ordinary weeds will not interfere with the crop.

As to shallow or deep cultivation, to the number of plowings to be given, the instruments to be used, and a variety of other matters, these depend on circumstances quite as varied. If the season is a warm and moist one, any amount of cultivation in almost any form will benefit the crop, but if moist and cool, nothing should be done which invites late growth, and cultivation after midsummer should be avoided. Where a drouth is approaching, continued shallow cultivation is desirable, but never deep plowing in very hot and dry weather, because deep cultivation in a hot and dry time produces disaster by firing the crop. The essential thing for a good corn crop being a rich, strong, clean soil, a mellow seed-bed, a good stand and an early start, any kind of cultivation which will leave to the crop the monopoly of the land will do as well as any other one.



CULTIVATOR USED IN THE CORN FIELDS OF THE RURAL FARM.—FIG. 4.

With these essentials attended to the corn crop of the black soil prairie yields from 30 bushels in bad season to 50 in average, or 75 to 80 in good, the rainfall and the temperature being an important factor in the outcome of crops, as well in Illinois as elsewhere.

[*The* RURAL NEW YORKER *has the proof that it has been offered and that it refused $15 00 per bushel for the yield of one of the wheats which were originated on the Rural Farm. This is one of the kinds of seeds which we propose to offer in our future Free Seed and Plant Distributions.*]

SOME EXPERIMENTS IN DEEP PLOWING FOR CORN.

C. E. THORNE.

THE following is a statement of some of the results obtained from a series of experiments in deep plowing for corn, made on the farm of the Ohio State University during the seasons of 1878, '79 and '80. Deep plowing, however, is hardly the proper term to use, as in these experiments we have not succeeded in disturbing more than twelve or thirteen inches of the soil, for want of tools adapted to the purpose.

CHESTER CO. MAMMOTH CORN PLANT.—FIG. 3.

The soil in which the experiments were made is a rich alluvium, largely composed of the disintegrated rocks of the Huron shale, and resting, in most places, upon a substratum of gravel, which gives the most perfect drainage. It is such a soil, in short, as the black walnut and sugar-tree delight in, but it has been continuously cropped for many years, with little or no manuring. It was supposed that a soil of this character would be found sufficiently weathered for the purposes of crop production to a considerable depth, and therefore two methods of deepening the tilth were tried in preparing for the crop of 1878:

(1.) Two strips, in different fields, were plowed to the depth of thirteen inches, by first turning eight inches of the surface with an ordinary plow, and then stirring five inches of the subsoil with a subsoiler; the land on either side of each strip being plowed eight inches deep with the ordinary plow.

The crop yielded as follows:

		Per acre.	
Strip (a), subsoiled, at the rate of		48.47	bus. (shelled).
Adjoining strips	"	51.07	" "
Strip (b), subsoiled,	"	49.23	" "
Adjoining strips,	"	55.37	" "

Evidently our subsoiling did not pay.

(2.) In a third field, a part of which had been in meadow and pasture for many years, while the remainder had been devoted to grain

crops, and was apparently much worn, a strip containing nearly two acres of land was plowed across both meadow and tilled land with a plow of the double-Michigan pattern, drawn by four horses working abreast; while strip on either side, of half this size, was plowed eight inches deep with an ordinary plow drawn by three horses. The corn was cut into four shock-rows, and the grain of each husked and weighed separately, with the following result:

		Per acre.
Row No. 1, plowed 8 inches deep, yielded		63.24 bus.
" 2, " 12 " " "		77.64 "
" 3, " 12 " " "		76.50 "
" 4, " 8 " " "		71.44 "
Average yield for 8 inch plowing,		67.34 "
" " " 12 " "		77.07 "
Increased yield for deeper plowing,		9.73 "

The yields of the portion which had been in meadow and of that which had been in cultivation were weighed separately, but the increase was the same for both.

(3.) In 1879 this field was plowed to a uniform depth of eight inches, but the products of the strips which had been under experiment the previous year were weighed separately, and showed a further increase of two bushels per acre for the deeper plowing of that year.

(4) During this season, experiment No. 2 was duplicated in another field, with the result of the same increase of two bushels per acre. This was a very unfavorable season for corn, owing to the failure of nearly all the seed first planted to germinate, thus necessitating two or three plantings to secure a stand, and making the crop late, while subsequent unfavorableness of weather prevented the crop from regaining the lost ground, so that the average yield of the best fields was not more than forty-five bushels of shelled corn per acre. Meanwhile our clover-seed had failed to catch, which necessitated the planting again to corn of the field in which experiments No. 2 and No. 3 had been made. For reasons connected with the general management of the farm we did not wish to use any manure upon this field, and therefore the area of deep plowing was considerably increased.

The result of the experiment was as follows:

Shock-row No. 1 plowed 12 in. yielded 53.64 bu. corn and 3,375 lbs. stover per acre													
"	2	"	12	"	"	"	62.35	"	"	?,357	"	"	
"	3	"	8	"	"	"	57.19	"	"	2,881	"	"	
"	4	"	8	"	"	"	59.27	"	"	3,069	"	"	
"	5	"	12	"	"	"	60.13	"	"	3,253	"	"	
"	6	"	12	"	"	"	65.00	"	"	3,382	"	"	
"	7	"	12	"	"	"	60.63	"	"	3,139	"	"	
"	8	"	12	"	"	"	60.41	"	"	3,053	"	"	
"	9	"	8	"	"	"	53.32	"	"	2,676	"	"	
"	10	"	8	"	"	"	53 68	"	"	2,870	"	"	
Average yield for 12 inch plowing							62.19	"	"	3,237	"	"	
" " " 8 " "							55.86	"	"	2,874	"	"	
Increased yield for 12 in. plowing							6.33	"	"	363	"	"	

(Each shock-row contained nearly one acre of land. The rows numbered 1 and 2 covered the same ground as those numbered 2 and 3 in experiment No. 2.)

The net value of the above increased yield, at the current rates here for corn and stover in the field at the time of husking, viz: 33 cents per bushel for the corn and $3 per ton for the stover, would be $2.63, while the experiment of 1879 indicates that the benefit of the deeper plowing does not end with a single season. The additional cost of this increase can be reduced to that of the labor of one horse in the plowing by the use of the sulky plow.

The stover in the above experiment was cut about 12 inches above the ground, and the value assigned to it is not more than half its actual feeding value when compared with hay at current rates, viz: $16 to $18 per ton.

It is interesting to note the ratio of grain to stover, being as one bushel of corn to 51.45 pounds of stover for the eight-inch plowing, and one bushel to 52.85 pounds stover for the twelve-inch plowing.

It will be noticed that the inversion of four inches of subsoil which had never before seen the light has had only a favorable effect upon the crop immediately following, although the plowing was done late in the Spring and the corn immediately planted. It is reasonable to suppose that some soils would be injuriously affected by such a sudden transition to deep working, such as shallow sedentary soils and possibly a few of the stiffer clays of the drift, but these experiments and others which have been made upon a heavy clay soil and drift formation justify the inference that the plow might profitably be set deeper in many localities. The only way by which a farmer may know positively the adaptability of his soil to this mode of working is by actual experiment, or by noting the results of such experiments upon soils of a geological origin similar to that of his farm.

In the case of soils whose drainage is defective the results of deep plowing are likely to

BLOUNT'S CORN—MALE FLOWERS DIVIDING THE EAR—FROM LIFE—FIG. 5.

be obscured by this cause; for instance, it can scarcely be profitable to deepen the tilth of a flat lying, soggy piece of land, unless the deep plowing can also be made a sort of under drainage, by carrying the water to still lower levels, for which there must of course be some outlet. In such a case the advantages of the deeper working should be still more apparent than upon such soils as that upon which our experiments have been made.

Farm Dep't Ohio State University.

[*By the carefulest selections and cultivation we are endeavoring to obtain a new breed of the Chester County Mammoth Corn which shall prove more productive everywhere, and better suited to the fields of the North than was the seed which was originally planted at the Rural Farm. In this direction we have already made marked progress with Blount's White Prolific.*]

RURAL BRIEFLETS.

THE advantages of drilling in corn are well set forth by Mr. Charles A. Green in his excellent "Corn Notes." . . . . . .

AT Professor Beal's request we sent to the Michigan Agricultural College at Lansing a few ears of the several kinds of corn raised at the Rural Farm during the past season. Here is his reply: "The Chester Co., Mammoth which you sent I think is the largest I ever saw. The Blount and Yellow Flint are also desirable." . . . .

FIG. 6.

WHEN manure is used in the hill, an excellent—though an old-fashioned fertilizer to give corn a start—is a full handful of hen manure that has previously been mixed with the same bulk of muck and wood ashes. . . . . .

IN our corn experiments, however, we have been led to think less of manuring in the hill than of sowing or spreading some soluble manure broadcast. We know of an instance in which bone meal (coarse) was used and the yield was over 80 bushels. Much credit was given to the bone, though it may be doubted whether it could have had *any* effect until another season. . . .

MANY of our readers have urged us to sell them small quantities of the above kinds of corn. We would gladly have obliged them, but our rule is one without an exception, never to sell anything to our subscribers. This corn will no doubt be offered by all prominent seedsmen whose catalogues will be noticed in these columns as soon as they are received. . . . . .

WE were struck by the force of the following remarks by our venerable friend Conrad Wilson. "One man gives great attention to *plant food* and little heed to anything else. Another is all engrossed with the problems of *tillage*, and discovers but little value in the other factors. A third attaches exceptional importance to the variety of the grain, or the question of pedigree, and so on to the end of the catalogue. But rarely do we meet with the farmer who is wise enough to divide his attention fairly between all the essential conditions that belong to a maximum crop. Yet it is entirely true, and not to be denied, that very fair results are often reached, even in spite of important factors having been overlooked, and it is also true and still more remarkable, that among all the corn products yet recorded, there is not a single case in which all the elements of success are included or even recognized." . . . . . .

WE should like to have our readers consider this question: What good does it do to hill up corn? . . . . . .

UNLESS seed corn has been selected with care, it is useless to look for large yields. It is not a very costly matter for each farmer to procure half-a-dozen varieties of corn which in other places he knows to have yielded heavily. These may be planted on small plots 33x33 feet square (one-fortieth of an acre) on different parts of the farm and the most prolific kinds thus determined for future guidance. . . . . .

WE are convinced that excessive manuring for corn is money thrown away. . . . . .

IT will be remembered that Joseph Harris announced a profit of about $700 on a corn crop of 15 acres. He attributed the result in the main to an exceptional amount of tillage both before the corn was planted and afterwards. THE RURAL NEW-YORKER *has been offered* $1.50 *per bushel for the entire yield of the Chester Corn* (minus the tips and butts); $3 00 *per bushel for all the Blount Corn that was taken from stalks bearing three ears and more and* $1.50 *per bushel for the rest.* At this rate our yield from *five* acres would amount to not less than $750. Of course such prices could be paid only for remarkable kinds of corn for seed purposes. . . . . .

IN every case, says Prof. Beal, the root-pruning of corn as tried at the Michigan Agricultural College was a failure. . . . . .

PROFESSOR BEAL writes us that he thinks Waushakum the most thorough-bred corn with which he is acquainted. . . . . .

THE ash of corn cobs is a good manure, since, as the cobs contain but a small percentage of nutriment, it is better to use the ash as a fertilizer than to grind the cob with corn for stock food. . . . . .

THE HORSE that succeeds in accomplishing his mile a few seconds sooner than any other, wins renown for himself and makes his master a hero, says Mr. Conrad Wilson. The event excites universal interest, and the press teems with eulogies that are shared in due proportion between the steed and his owner.

The pugilist who by dint of muscle and power of endurance, succeeds in vanquishing his antagonist in the ring, punishing him within an inch of his life, and pounding his features into a condition equally frightful and disgusting, is triumphantly escorted from the arena by an applauding multitude, and his fame goes abroad on every wind of heaven. The truth of the above paragraph will be conceded. Here is the application: BUT the farmer who at the least cost of production, raises the greatest amount of corn to the acre is not eulogized by the press; is not applauded by an admiring multitude and his fame goeth not abroad on every wind of heaven. . . .

PROF. COOK, as we have stated, from experiments made in 1872, condemns the use of sulphate of ammonia for corn. Both corn and stalks were diminished in weight by its use. But muriate of potash was beneficial to both corn and stalks. He concludes that corn is a potash plant. What plant is not? . . . .

The average yield of corn is about 40 bushels to the acre. The average yield of wheat is about 13 bushels. We can from present knowledge, more easily increase the average yield of corn to 75 bushels than we can that of wheat to 20 bushels. . . . . .

THOROUGHBRED SEED-CORN.

E. LEWIS STURTEVANT, M. D., SO FRAMINGHAM, MASS.

THE ONLY two thoroughbred seed-corns I know of, are the Blount's Prolific and the Waushakum, both corns which have justified themselves by trial as being of extra uniformity and of great fecundity. In the farm practice of Mr. Carman on Rural Farm Blount's Prolific has yielded 134 bushels shelled corn per acre; with Sturtevant Bros. a single acre planted with Waushakum has given 123 bushels shelled corn.

The difference between a well-bred corn and ordinary seed is scarcely apprehended by those who have not tested experimentally. Uniformity is one point gained—a point visible to the eye in the seed and in the growth of the plant. This is not, however, all. Whatever is called thoroughbred possesses a uniformity and transmits its own peculiarities strongly. A thoroughbred seed with fecund habit gives uniformity and fecundity. A thoroughbred seed with non fecund habit, gives uniformity and not fecundity. So it is seen that something more than mere thorough breeding is required: we must breed towards fecundity. When seed-growers do this last, then scarcely any size of crop within reason can be considered improbable or impossible. Now these two seed-corns, mentioned by name not for advertisement, but simply because they are the only two illustrations we have, derive their value from the fact that through selection and proper manipulation they have become thoroughbred and fecund.

Another point of view, which we will give in the form of a positive statement: Under ordinary poor care, poor fertilization, and inferior management of crop, a field planted with thoroughbred and fecund seed *may* not yield more than another field, under equivalent conditions, planted with ordinary seed of medium good quality. Let, however, good conditions of culture be applied, and the thoroughbred seed immediately responds to the good treatment far in excess over the other seed, and gives a far larger crop. It is easy to obtain a 40-bushel crop with any good seed; we cannot be sure of the 80-bushel crop without using the best of seed; we cannot hope for the 100-bushel crop without a thoroughbred seed.

I speak in this article of corn grown in large areas under ordinary conditions of farm culture, and not the one-eighth acre lots so popular with some, because the outside roots, which form such a large percentage of the total roots in the lot, feed outside the measured bounds, and give better results than would be shown on a large field and thus serve the purpose of a brag crop.

Could Mr. Bowditch, of Framingham, my neighbor, have obtained 100 bushels per acre of shelled corn on a field of 17½ acres, manured with fertilizer and managed economically by machinery, without hand labor except in the harvesting, except he had the benefit of thoroughbred seed? His own experience proves the contrary. These are his figures, based on $1.50 a day for man and 75 cents a day for horse labor:—

Statement of E. F. Bowditch, Millwood Farm,

Framingham, Mass. Field surveyed by C. J. Frost, an expert.

Dr—	
Labor up to harvest	$98 85
" stooking	60 00
" harvesting	234 07
138 bags Stockbridge corn manure	579 90
Total cost	$972 82
Cr.—	
52 32-100 tons stover at $8	$418 56
Cost of 3,474 baskets of ears of corn	$554 26
17.4 acres, yield per acre	199.6 bushels.
Cost per basket	16 cents.

In farm measurement two baskets of ears are called one bushel of shelled corn. As a matter of fact, sale being by weight, two baskets yield one bushel and one quart of shelled corn by measure, or 62 pounds by weight, or 1 1-10 bushel corn at 56 pounds to the bushel. This makes the yield read 99.8 bushels shelled corn by measure, or 109¾ by weight. This is a reliable farm yield, without extra cost or appliance, of 109¾ bushels shelled corn of prime quality on 17 4 acres of land.

[We shall continue throughout the present year our original illustrations of Pears, Apples, Grapes, Peaches and Small Fruits of all kinds.]

NOTES ON CORN.

PROFESSOR I. P. ROBERTS.

After twelve years of experimenting and careful observation, I am led to the following conclusions which, however, subsequent knowledge will doubtless modify or perhaps entirely overturn. They are all based on carefully conducted experiments and I prefer to give the results of my work in this condensed form rather than in extended tables of details. Soluble commercial fertilizers, if used in large quantities, should be applied broadcast, one half just after the corn is cultivated the first time. The reason why superphosphates appear to do so little good the first year, is that the soil is rich in lime and the phosphoric acid combines with the lime in the soil and for the time being, becomes insoluble. The plant food is not thrown away though no present increase appears, and will benefit the succeeding crops as the locked-up phosphoric acid becomes slowly soluble.

Farm manures give better results when applied in the Fall or early Winter than when applied just before plowing in the Spring.

Fall or early Spring plowing when done under proper conditions and when the soil is in other respects carefully prepared before planting, gives far better results than late plowing, except on clover lees, when by late plowing, quite a growth of clover may be turned over. In those localities where the seasons are so short or so cool or where the soil is so cold that the larger varieties of corn do not do as well as the smaller or flint varieties, the plowing, if done in the Spring should not usually exceed six inches in depth.

In cold soils, or cool climates, moderate ridging is very beneficial, if not done in too dry weather; heavy ridging is admissable in continued cool, wet weather. Warm, light soils in almost any climate, and almost any soil in a dry or hot climate, give better results with flat culture. In most localities in the Eastern and middle States, drill culture gives the best and most economical results both in corn and "stover" after one has learned to seed thickly, to cultivate extremely close while the plants are young, and to cut out with the hoe the surplus and weakly plants. With larger varieties of corn in most of the great corn districts of the West where land is cheap and labor dear, and where "stover" is of comparatively small value, hill culture is to be preferred.

From five to twenty-five bushels increase per acre is often due entirely to seed of superior quality or variety. Superior culture and fertility though unimproved seed is planted, if it is aided by selection for a single year, often give to the product the tendency in after years to produce from three to five bushels more per acre than the normal yield of the variety; by proper management this tendency to increased yield may be carried still further but no succeeding year is liable to give such marked results as the first.

Root pruning in rich soils in moist or wet weather when growth is very rapid, is apt to be beneficial; in dry hot weather, it is quite as apt to be injurious. Suckering corn, taking one year with another, diminishes the yield. The feeding value of corn for milch cows, young cattle and work horses, based on chemical analysis, is far less than its real feeding value. To illustrate: in Scotland they [illegible] to two pounds in weight per day with a ration of ten pounds straw and two hundred pounds turnips. Five pounds of oil meal are theoretically equivalent to one hundred pounds of turnips but when substituted for them, the bullock ceases to gain in weight; that is, turnips are worth more than they are credited with, or oil meal is worth less. My judgment is, that corn as an animal food, is usually rated much below its real feeding value.

CORN NOTES FROM VIRGINIA.

HUGH L. WYSOR.

Commercial Fertilizers.

I presume it was the Rural's object last year in offering premiums for the greatest yield of Blount's Prolific corn on a certain specified plot, to ascertain in some measure how much corn it is possible to raise on an acre without regard to the cost of cultivation or the profits of the crop. To my mind a far more important problem which needs solution is, how much corn can *profitably* be raised on an acre, taking into consideration the use of commercial fertilizers. This problem must be extended to embrace a method which shall be *practically* appliable to at least five acres.

Now the methods usually followed in raising premium crops are not such as can be adopted in a field of the size mentioned, much less in one still larger, nor, for the same reason, can a fraction of an acre, cultivated at great trouble and expense, show what may be done on a single acre, not to speak of five or ten acres. Dr. Chamberlin's yield at the rate of over 186 bushels per acre, compared with the Rural's yield of 142 bushels, shows this conclusively. Prof. Blount's crop of from 70 to 96 bushels through a period of several years without fertilizers was a more profitable crop than if he had raised 180 bushels following the method of Dr. Chamberlin or that of any of the winners of premiums, and applying it to the ten acres he mentions in the Rural of March 6th. Indeed, any such method would have brought him heavily in debt.

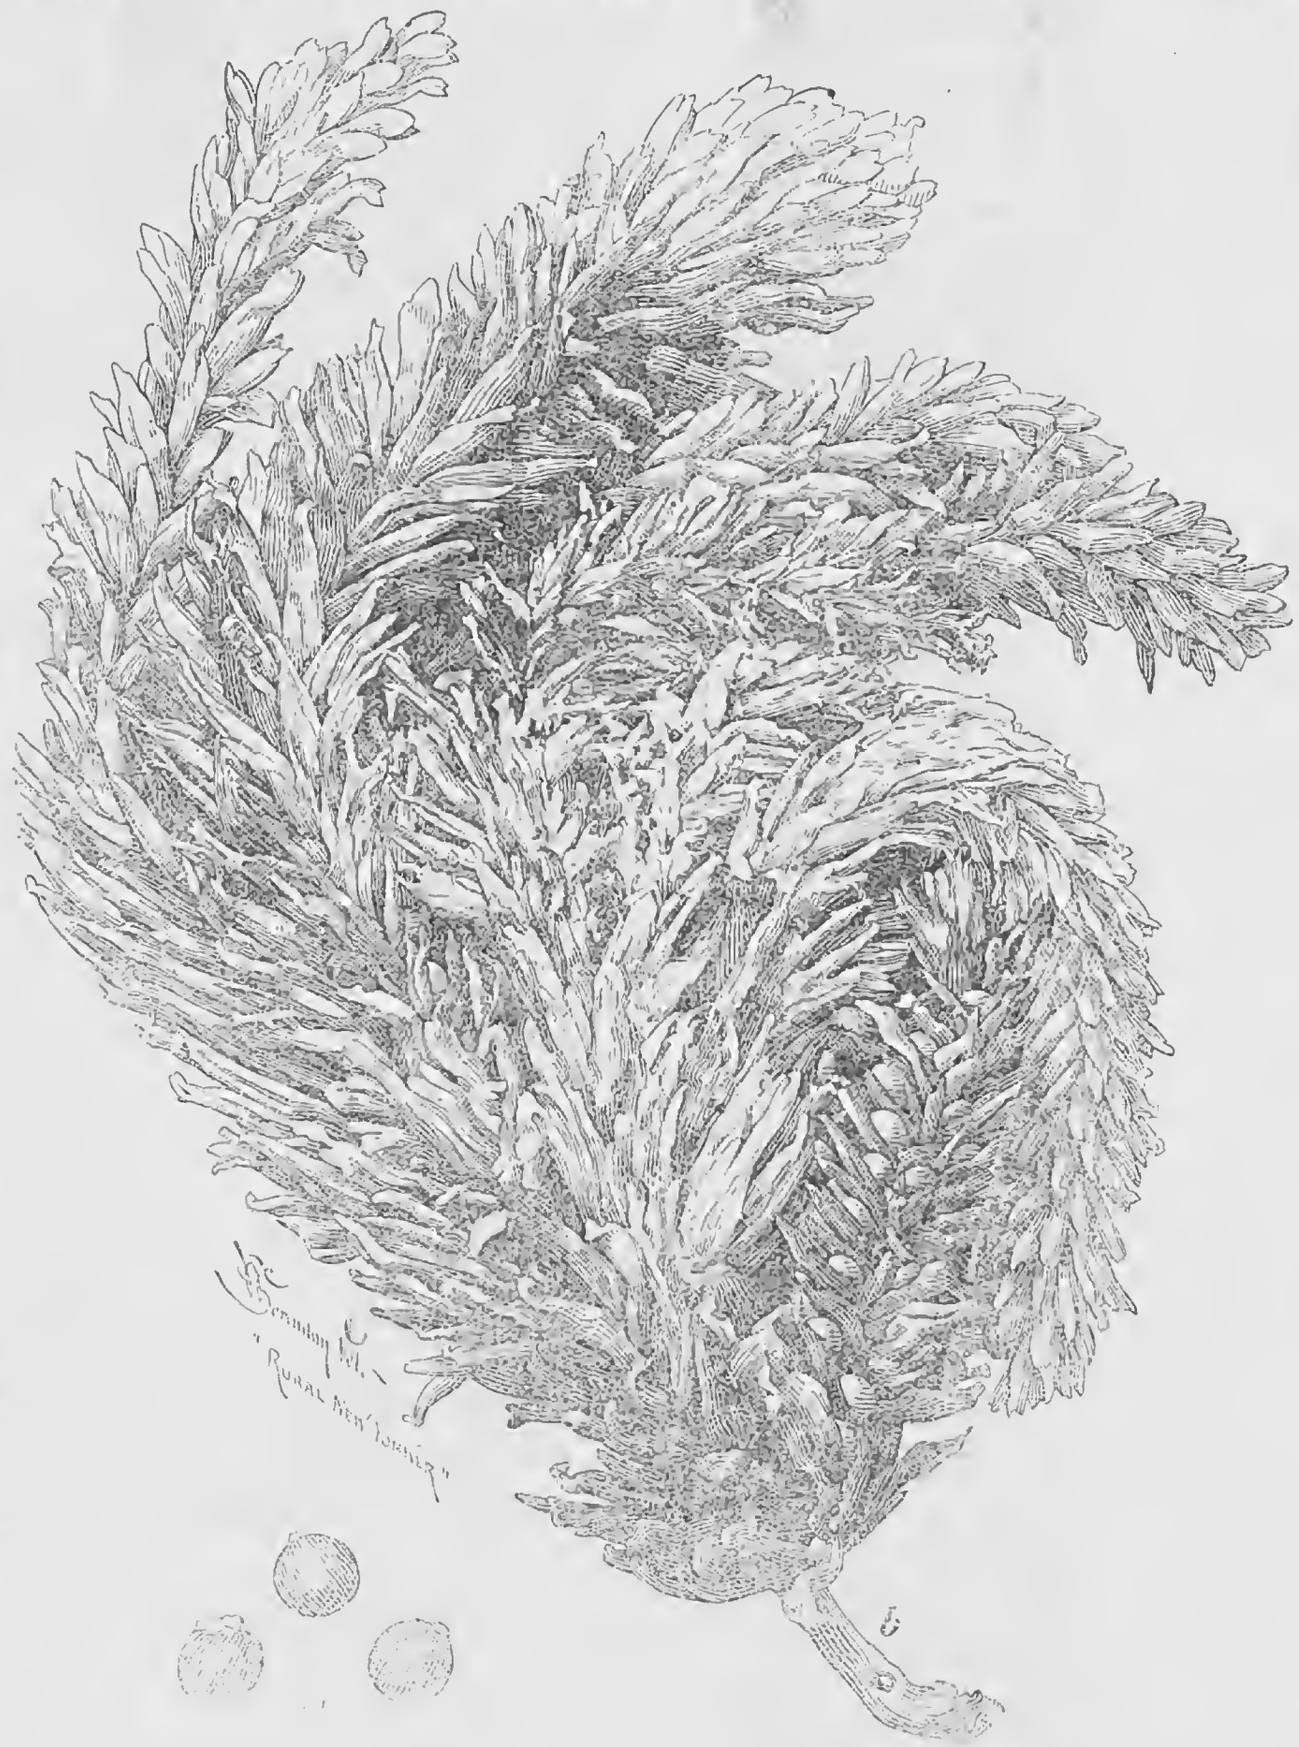
I remember that one agricultural paper advertised as one of its merits that it taught farmers how to raise 60 bushels of wheat or 100 bushels of corn per acre. This was well enough, provided it taught at the same time how these two things could be done with profit. But farmers have no desire to know how such large quantities of these cereals can be raised if they must be raised at a cost of five dollars per bushel to sell in market, the one at one dollar and the other at fifty cents or less. They have no earthly use for such knowledge, unless it be for the gratification of an idle curiosity. Here, then we are brought face to face with the question whether the use of commercial fertilizers on the corn crop is at all profitable. I am inclined to answer no, to this question. If a small quantity of fertilizer be used, it produces no effect, if a larger, the increased yield does not pay for the extra expense.

The report of the Cornell University experiment station shows that in no case was the increased yield of either wheat or corn sufficient to pay for the fertilizers applied to produce it. (See Rural of July 24, '80.) I saw recommended in some agricultural paper the application of one half pint of bone dust to the hill of corn. A good article of bone dust costs here, inclusive of freight, $50 a ton. Now it can easily be shown that using even a gill of this manure to a hill of corn will require nearly a ton to the acre. If, then, we say that on land which before brought 50 bushels per acre, this application increased the yield to 100 bushels, it will take the whole crop at 50 cents per bushel to pay for the fertilizer. The estimated yield of the Rural's Blount corn this year as reported in its issue of Nov. 13, is 142 bushels. This has been in part secured by the use of 500 pounds of fertilizers. It is fair to presume that the cost of these manures was $10 per acre, as no high grade fertilizer can be bought for less than $40 a ton. It would require, then, an increased yield of 25 bushels per acre, allowing the price of corn to be 40 cents, to pay for the manures. If the soil simple would have produced 117 bushels, the fertilizer has been of no value; if more than that, it has brought the Rural in debt for its use. The uncertainty with which all commercial manures act—depending as they do upon the character of the seasons and the soil—and our ignorance of what the soil is in need of, will always render their application of doubtful value.

The case of wheat, however, is quite different from that of corn, because wheat brings a much better price in the market. On wheat, it yet remains to be settled how small or how large a quantity of fertilizer may be used with profit. It might be more profitable to use 500 or even 1000 pounds per acre than 200. If it be granted that the application of 1000 pounds of a $50 fertilizer will increase the yield from 25 to 50 bushels, then that amount can be profitably applied. Yet, as the Rural has several times shown, a man may have to test every field on his farm to find out what fertilizers are adapted to it.

Cuzco Corn.

Last Spring I purchased ten kernels of this corn from J. J. H. Gregory, Marblehead, Mass., and planted them about the 20th of April in my garden. Six of them came up and grew. All were in tassel about the 20th of July. Several weeks elapsed after that before any shoots appeared, and two of the stalks never bore any shoots at all. None of the stalks exceeded 11 feet in hight and two of them were not over nine feet. As I watched this corn from time to time I observed that the blades as high up as the seventh joint were stripped away from the stalk as if some one had caught hold of them and jerked them down. I at first supposed that the children had done this, but on a closer examination I found that it was caused by the brace-roots, which came out at every joint as high as I have mentioned and pushed the blades off the stalk. This shows that the corn must grow very tall in its native country to need so much bracing as this. It is of a different species from our varieties. [It is possibly Zea macrosperma. See Rural, March 13, 1880.—Eds.] The stalk for three or four feet from the ground is of a dark brown color, and the ears grow in clusters, not singly as in our kinds when they bear more than one ear to the stalk. One center shoot first appears and then frequently as many as seven or eight shoots grow out of the sides of this. The ears are not longer or larger than our nubbins. The kernels grow, not as in our corn, perpendicular to the cob, but at an oblique angle to it, which accounts for the great length and breadth. Only one of the stalks matured its ears, and this was owing to accident. It was blown down by the wind and nearly all of its roots broken. I tied it up to a stake and it hardened its grain about the last of October. You will see by the sample I send you that the kernels are much diminished in size. [The kernels were not received.—Eds.] The kernels on the other stalks reached their full size, but were still very soft on the 20th of October, when they were destroyed by the frost. This corn could probably be adapted to the climate of Virginia in the course of three or four years, but it is doubtful whether it would be worth the effort.



(a) Kernels of Tassel, Natural Size. (b) Tassel of "Podded" Corn (Wild Corn of America?) Reduced one-third.—Fig. 7.

Corn Planted After Harvest.

I purchased one-half bushel of eight-rowed white Flint corn of Messrs. B. K. Bliss & Sons, and planted two and one-half acres in it after having removed a wheat crop which had grown on the land. The corn was got in between the 1st and 5th of July, and matured perfectly by the 1st of October, yielding about 30 bushels per acre. This variety does not grow taller than six feet, and the yield would have been greater if I had made the rows two and a half feet apart instead of three feet. The field was sown down to clover in August and a fine set obtained. There were only two things particularly noticeable about the crop. One was that there was not a single ear which had not one or more cornworms in it. The other goes to confirm what Professor Thomas has said about the new wheat enemy in the Fair Number of the Rural. About one-fifth of the plants perished within three weeks from the time they appeared above ground. All of the diseased plants that I examined had several of the maggots described by Professor Thomas in the pith of the stalk, which caused the center roll of leaves to wither, as in the case of the wireworm. These maggots came, no doubt, out of the wheat stubble which had been turned under.

Prof. Blount's Theory About Corn.

In all the advertisements of the White Prolific corn, it has been stated as Professor Blount's theory that every joint which has a groove should bring an ear or a shoot. This language would seem to imply that there are joints on a stalk which have no grooves. If I understand what is meant by a groove, all the joints have it. Why not say, then, that every joint should bear an ear? By the way, the Rural's last experiment has proven that a variety of corn bearing three or four small ears to the stalk possesses no advantage over a variety bearing one large ear, for it is yet in doubt whether the Blount has yielded more than the Mammoth Chester.

Professor Blount also advised "W. S. M.," in the RURAL of May 8th, to select for seed even-rowed ears and ears whose rows are straight. Has the Professor ever seen an ear which had not an even number of rows? Mr. A. B. Allen, some time editor of the American Agriculturist, and, I think, a present contributor of the RURAL, asserted in the year 1842 that he had seen an ear which had 21 rows. The next year he received numerous communications to prove to him that he was in error. In his replies he is hard put to make out his case, but finally concludes that things of this sort are freaks of nature.

[*The* RURAL NEW-YORKER *has in no instance* SOLD *the plants or seeds raised upon its Experiment Grounds. Our first object is to* MAKE KNOWN *the value of new plants through our Free Seed and Plant Distributions. We leave it to the seedsmen and nurserymen to supply the demand thus created.*]

THE RURAL'S ADVICE AS TO THE CULTIVATION OF INDIAN CORN.

1. PREPARE the land thoroughly by harrowing and rolling. The roller breaks up hard lumps of earth which the harrow passes over. A thorough preparation of the land is as essential as a liberal application of manure.

2. IT IS of the first importance to select seeds which are the best adapted to the soil and climate. Experiments have shown that of two distinct varieties of dent or flint corn, treated in all respects alike and raised upon the same field, one has produced fifty bushels of grain to the acre more than the other. The best and most economical way to ascertain what variety of corn is best suited to a given farm is to test different varieties upon different plots. These plots should be as far apart as practicable to prevent mixing. Plots 33 feet square, one-fortieth of an acre, are large enough for the purpose and the yield thereon is easily computed.

3. DRILL in the seed, six, or even three inches apart. At the first hoeing plants may be cut out so as to leave the distances between those remaining suited to the size of the variety of corn planted.

4. A NARROW, *heavy* roller may be advantageously used upon the drills after the seed is dropped. This insures a close contact of the soil with the seed and an earlier germination.

5. DO NOT USE A PLOW AFTER the seed is planted.

6. KEEP THE SURFACE of the ground MELLOW and all weeds subdued.

7. CULTIVATE SHALLOW and FLAT with cultivator and hoe.

RURAL REBUS.—FIG. 8.

PRACTICAL RESULTS VS. POSSIBILITIES WITH CORN.

COL. F. D. CURTIS.

THE *possibilities* of corn crops are problematical, but the *probabilities* are very much in line with practical experience. Every farmer of common intelligence knows that the more he feeds his corn crop the more he feeds his corn crib. If the average farmer can raise 50 bushels of shelled corn to the acre, he is well satisfied with his crop. This yield, however, exceptional, as the average would not be as much. Mr. D. F. Wicks raised this year 1,300 bushels of ears of corn on 11 acres. This is considered in this latitude (43 deg.) to be an unusually fine crop. Alexander Davidson, Esq., just across the road, must have had equally as good a yield.

These fine crops were produced by a liberal sprinkling of barnyard manure, which was thoroughly harrowed in on an upturned greensward. It was not the manure or the soil altogether (although the land was in good heart) which produced these crops, but the important auxiliary of early and constant cultivation of the corn itself. Farmers are getting in a lax way of not hoeing their corn or cultivating it as much as formerly.

In olden times, when cultivators were crude implements, a great deal of hand-hoeing was necessary. Now, with improved cultivators, many go to an opposite extreme and do not hoe at all. This is a mistake. Nothing will give a young plant a good start and keep it growing better than stirring the ground and putting fresh soil around it. It takes hand labor to do this, and it should be done as soon as the plants are well started. The crust on top of the hill which has been formed while the corn has been coming up needs to be broken and mellowed so that the dews and heat may readily penetrate to the young rootlets. When there is a scarcity of manure, experience and observation have both taught us that it is always best to apply it directly in the hill with a slight covering of earth on it, upon which plant the seed. We made four loads of sheep manure, applied in this manner, go a long ways, covering several acres last Spring with most satisfactory results.

The next most important consideration in the growing of corn is the selection of seed. Everybody knows that there are varieties of corn suited to latitudes, but everybody does not know that corn can be made thoroughbred, that is to say, that it can be so grown that it will possess characteristics or innate qualities which fit it not only for latitudes, but for special soils and conditions, and a nature also, or aptitude, to take care of itself under unfavorable circumstances. For instance, with two kinds of corn adapted to the same latitude, one will not, in a cold, unfavorable season, produce anything, whereas the other, by possessing a strong nature, notwithstanding the unfavorable surroundings, would yield a good crop. Take another case, one kind of corn, 12-rowed Dutton, as we have experienced, on poor land produced no ears of any account, whereas Smut White yielded a fair crop. On land excessively rich the 12 rowed kind would probably afford the largest yield.

The adaptation of the variety of corn can best be determined by practical experience. We succeeded this year in raising a good crop of corn on poor soil by traveling backwards. We sought out an old farmer who lived on a farm with thin soil and obtained our seed from him. We said "we didn't want Short-horns on moors." This farmer had bred his own corn for half a lifetime—the same variety on the same farm. Every year he had gone into the field and selected the earliest and the best ears, taking them where there were two on a stalk.

This corn had become adapted to his soil and he was always sure of a crop, even if the season was unfavorable. It was indigenous. By his system of selecting the earliest and the fittest he had reduced the time for growth to less than 80 days. This seed, on an old pasture this year, without manure, produced a fair crop of corn. All over the piece there could be seen the effort to produce two ears on a stalk, although many of them were short. It is a mistake also to mix seed corn, that is, to plant several varieties together, as the dropping of the pollen is not uniform and the effect is like planting one hill of corn by itself, as the different varieties will vary in the maturing of their pollen.

We do not believe, so far as corn is concerned, in changing seed. It is more sensible to improve the old seed rather than to import strange varieties, which, as we have found, are totally unsuited to our use. The nearer we can make our corn indigenous to our own farm the better, and then improve the same by the best culture.

SOME MISTAKES IN CORN CULTURE.

HENRY STEWART.

CORN is the most prolific grain we grow. An average ear contains 500 grains and there are varieties which produce nearly 1000 grains upon an ear. An easily possible crop is 100 bushels of grain per acre and the stalks are worth several times as much as any straw. Corn serves more useful purposes than any other grain. It is not only an agreeable, nutritious and healthful human food, an acceptable and profitable food for every one of our domesticated animals, but it is the basis of several very useful and important manufactured staples. If by some unforeseen accidents every other grain crop, every root crop, and all our grass and other fodder crops were lost to us, we could still survive and prosper if only corn were spared. Mankind could still be abundantly, variously and agreeably fed; our beef would still be provided; our pork, our mutton and our poultry would be sure; the dairy would not suffer for necessary fodder and grain food; the housekeeper would have her starch and her syrup; and the children, even, might not miss their favorite candies. In its place as only one of our field products it provides employment for a vast army of men; it furnishes freight for five million railroad box cars every year; a number, which if placed in line, would reach 30,000 miles, or starting from San Francisco eastward would lap around the world and leave a second line reaching over to Central Europe; and which passing at the rate of one every two seconds would require 300 days of 10 hours each to pass by any stationary observer. At the same time there is no other product whose use is so steadily extending year by year or which can more easily bear a steady increase.

This being the case, the importance of considering how the product of this grain may be increased can scarcely be over estimated. Some years ago when discussing the possibility of largely increasing the product of wheat, I was met with an objection by a prominent agricultural writer to the effect that it was not wise to argue in favor of increasing the yield of wheat, because there was only a limited demand for it and a large surplus would be unsalable. Having been used to consider, as an economical fact, that demands are created by supply, rather than supplies are brought out by demand, and seeing this fact exemplified in most surprisingly varied cases every day, I have never had any fear in urging farmers to enlarge their products in every possible way. And the fact that a yearly product of nearly 500,000,000 bushels of wheat can now be disposed of without difficulty, ought to show that if our corn crop were to be doubled within the next ten years every bushel would doubtless be sold or used to advantage.

BLOUNT'S WHITE PROLIFIC.—FIG. 9.

I firmly believe that within the next decade our total corn crop may reach to 3,000,000,000 of bushels and that every bushel will find a use or a market. Further, I believe that this vast quantity which is about 1,000 bushels to each farm in the United States may be grown upon no more than an average of 10 acres to each farm, yielding an average of 100 bushels per acre. For a great change has occurred within the past few years in corn growing. A dozen years ago when any enthusiastic person hinted at a crop of 100 bushels per acre, he was treated with derision, and the farmers who grew such a crop were few and far between. Now, one can scarcely pick up an agricultural paper without noticing some report of a crop of 100 bushels per acre or over. No one doubts it now. And no farmer who has succeeded in growing 100 bushels upon an acre doubts or can doubt that he can do considerably better if he will only avoid some mistakes which he can plainly see has reduced the possible yield of his crop.

There are some very frequent mistakes made in growing corn. These are due, perhaps, to too rigid a conservatism on the part of farmers. It is judicious to observe a conservative practice in the main, but it is at the same time wise to try new methods in a safe manner. Every farm must be worked and managed to a great extent by its own code of rules, and what Mr. Jones finds proper to do in his fields and with his own system, may not be right for Mr. Smith over the way to do. So that one whose bread depends upon his crops should not risk it by making innovations until he has made himself sure by repeated tests that it is entirely safe. Now it will be quite safe for every farmer who plows his corn deeply between the rows to try an acre or half an acre with flat cultivation instead of plowing. It is a mistake to put a plow into a cornfield after the plants are a month old. At that age, I have traced corn roots entirely across the rows, and intermingling with those of adjacent rows. It cannot be right to cut and tear those roots and deprive the plants of their mouths by which they feed, or to confine them to a narrow strip of soil of only two feet wide. I know it is not right for me to do so. When I first used a Share's horse hoe for cultivating corn nearly 20 years ago, I was first encouraged to try to grow large crops of corn, for I found flat cultivation greatly increased the yield. More recently I was still more forcibly taught that plowing corn was a mistake. A field of sweet corn was partly cultivated with a horse hoe and a part was plowed. A stubborn hired man, who thought his plan was the best, and in spite of orders, plowed four acres very deeply, earthing up the corn several inches. It was as severe a case of root-pruning as one could wish for. The consequence was that from that day the plowed corn stopped growing, and yielded not one ear, while the rest of the field produced more than eleven thousand ears to the acre. Root-pruning corn is a serious mistake and deep plowing among corn is root-pruning. Another mistake is in suffering barren stalks to matnre pollen in the fields.

It is the presence of these barren plants in a field which so largely decreases the yield. Some kinds of corn, grown without selection and without care to prevent fertilization by barren plants, will produce two barren stalks out of five; other kinds which have been carefully bred only from perfect plants will have rarely a barren plant upon a whole acre, and this one should be carefully emasculated. This is a process of emasculation to prevent breeding from undesirable male plants, and is precisely parallel to the same method practised with animals. It is therefore a mistake to neglect it.

A mistake is also made in fertilizing. Corn may be over-fertilized. It is over-fertilized when upon good or rich soil a large dose of artificial fertilizer is used; or when a too liberal quantity of the common home-made fertilizer, poultry manure and wood ashes mixed, is applied in the hill. Corn requires repeated moderate fertilizings, upon moderately good soil to begin with. As for instance, 100 to 150 lbs. per acre at the planting, and a similar application at intervals twice during the growing season. The best crop of corn I have grown had at the rate of 600 lbs. of special fertilizers in three doses, one at planting, one at the second cultivation, and one when the tassel first appeared. Large applications of special fertilizer, before and immediately after planting are useful upon poor unmanured soil; but when other manures are used, the special fertilizer should be given at intervals. It is a mistake to force the crop to too vigorous leaf growth in its early stages. A portion of acceptable soluble food is especially beneficial when the ears are beginning to form. Frequent cultivation is also beneficial up to the latest possible period.

Hill planting is also a mistake. Nearly twice as many plants may be grown by planting in drills. Hills, 3 feet by 3 apart, give 9 square feet for each. Drills 4 feet apart and seed at 2 1-4 feet apart, give also 9 feet. But by planting 18 inches apart in 4 feet drills there are 50 per cent, or one-half more plants on the same ground. and almost invariably the crop yields about the same proportionate increase of ears. On a plot of about 3 acres of evergreen sweet corn, part planted 3x3 and part 3x1½, apart, the latter portion gave fully as good ears and twice as many to the row as the thinner planted. The increase in fodder alone in drill planting, even if nothing is gained in ears, is sure and sufficiently profitable, but the increase in grain is rarely less than 25 per cent. If this is true, hill planting is a mistake, and if the cultivation is made by a good horse-hoe, and is begun before the weeds start and when the plants are small, the ground may be kept very clean even when planted in drills.

MY NEIGHBOR'S CORN.

PROFESSOR W. J. BEAL.

A NEIGHBOR has just sold me a load of Indian corn in the car. He is industrious, economical, and what most people would call a good practical farmer. "Do you like this kind of corn." I said, "Yes, it husks awful easy and shells, oh! very easy. It gets ripe early. I get a good deal of shelled corn to a bushel of cars. The cob is small." "How long have you raised this kind?" "Two or three years."

"Will you select some ears such as you would plant?" He did so. The corn is mostly a small red-cobbed dent. The largest ear was seven inches and contained twelve rows which were more or less broken and uneven. The diameter of the ear through the middle was just an inch and a half; through the butt end an inch and three-fourths. The ear is quite prim and the kernels of a bright golden yellow color. The tips of the kernels are but slightly depressed. The kernels are widest at the middle and taper each way. By this means there is a deep groove or furrow near the surface between the rows. These grooves give a good opportunity for the teeth of horses and swine to get off the corn. Many ears of corn, not such as he preferred for seed, had but eight rows, and the cob could be seen between them, because the kernels tapered the wrong way from the end next the cob to the surface. He rejected the ears which had kernels containing large indentations. They were not so bright, not so solid and did not ripen so early. He wanted the ears well filled out at the tip. His crop was light, he did not know how much to the acre. I thought he might add a third or more to his crop by procuring seed of another variety near him. The first question asked was the cost of the seed. He would prefer to plant his own seed to paying a high price, even for a better variety. The kernels should be wedged shape with the small end next the cob. If we want to increase the length, ears should be saved which are not filled out at the end. This indicates that there is still room for more kernels if every thing else were favorable. Ears well tipped or filled out to the end are not inclined to produce longer ears, but those which are shorter.

For ease in husking, the cob should not be very large at the base. I see no objection to a cob of some size as it probably costs the plant but little effort to produce so much woody matter. An ear with a large cob would require more time to dry out thoroughly, but it has room for a good deal of corn. Our seasons are short and we need a corn which shall occupy the whole of the warm weather for growth and maturity. We lose three weeks of growth and very likely something in yield, if our corn ripens by the middle of August, when it might grow till the end of the last week in September without danger of frost.

[*We hold that an agricultural and horticultural journal cannot sell the seeds or plants or farm implements it announces in its editorial or advertising columns and yet inspire a high degree of confidence in the minds of its readers respecting the disinterestedness of its views, touching the articles thus offered for sale.*]

CORN IN CENTRAL NEW YORK.

EDITOR RURAL NEW-YORKER.—Corn, its value, different sorts, and methods of cultivation, by farmers in the different states, is to be the initial number of the RURAL for 1881. On my farm with such cultivation as I have ever thought best to give, I have not yet succeeded in raising one hundred bushels of shelled corn on one acre, or if so have not done it where it has been harvested by itself; have in some instances of trial come very near it, and in most cases where that amount is reported to be raised it is taken from trial plots and estimated, which is a very loose way of getting at the true amount raised. I have no doubt that that amount has been raised on an acre, and even more, but that it is a common crop even with good farmers I do not believe, nor do I think it will be very soon.

It is usual in this vicinity to plant our corn in squares to cultivate each way, the distance we plant the hills apart varies from three to four feet, usually about three feet six inches, and to leave four stalks in a hill. Some drill or plant their corn with rows running only one way with two or three stalks in a place, about eighteen inches apart in the rows and the rows three feet and six inches apart. This method will doubtless yield the most corn per acre, with more expense in cultivation. Where the soil is mellow and free from weeds, the drill system is no doubt the most productive in grain, and perhaps in fodder also, but with weedy land the expense of hand cultivation would more than balance the extra yield of corn or fodder. We do not in this latitude grow the western or southern corn to any extent, the Dutton, is one of our best sorts, grows abundant crops in both grain, and fodder, and ripens with the season in good time for the fall harvesting, and is thought one of the best sorts by many farmers, while many farmers cultivate smaller varieties of eight rowed sorts, both white, and yellow. Each sort has its advocates, and each is best on different soils no doubt, as the eight rowed sorts are usually the earliest to mature and do not grow as large stalks, hence on lighter lands are the best sorts to cultivate.

Our methods of culture are usually by turning over greensward, with a coat of stable manure, either plowed in or spread on the surface after plowing and worked in with the harrow, or cultivator, and sometimes both, as the condition of the soil may require, either method usually produces good crops of corn. Some of our best farmers are now using more or less commercial fertilizers in the hill, or drill at planting time, and think it a paying investment, while others who have tried that method of manuring think it a waste of money in their purchase. On the whole, the use of commercial fertilizers is on the increase, and in some cases there seems no doubt of their benefit, but I think every farmer should make and use all the manure he can first; then a little superphosphate to give crops an early start, would no doubt be beneficial to the maturing crop at harvest time. Each farmer must try the experiment on his own fields, and on the crops he cultivates, in order to obtain a correct knowledge of their true value for himself whether it will pay him to continue to use them, or to abandon their use and depend on the farm-yard alone for manurial purposes. I am one of those farmers who think that every farmer should experiment for himself. The knowledge thus gained is worth more than any experiment carried on by other persons in different soils and in different sections of the country.

Rome, N. Y., Dec., 1880. J. TALCOTT.

CORN NOTES.

CHARLES A. GREEN.

PLOW sod land, if clay or clay loam, in the Fall or early Spring, while the soil is moist. Get the soil in good condition if it takes all Summer. Make it rich. If we grow a heavy crop of corn in ninety days we must give it bountiful rations; hunger must not gnaw at its vitals.

Scatter the fertilizer broadcast, whatever it may be, corn is not squeamish in the matter of diet. Manuring in the hill is something like piling compost about the trunk of an apple tree. You can not place a handful of fertilizer in your corn fields where the corn roots will not reach it, unless you thrust it in the fence corner.

Select the best seed—this crop is exceedingly appreciative of attention in this regard; select that which ripens first. Change seed at times, securing that grown further North, as that will be likely to ripen earlier, and corn is always liable to be overtaken by frost.

Don't plant too early; of the two evils I prefer planting very late to very early. If the seed does not sprout at once after planting, it is very liable to injury or total destruction. The crop thrives best in hot weather; during chilly May days seed corn is safer in the bin. I have seen heavy crops from June planting. May 20th is the average day of planting in this county.

Plant with a grain drill at least four feet apart between the rows one peck of seed per acre and roll after planting, if at all dry. I once had a fine crop with one-half bushel seed per acre, but we thinned out the thickest parts with hoes. The drill reduces the cost:

(1.) By planting it in the time you would mark it one way—an entire saving of the hand labor and the corn marker, one way.

(2.) If you desire to apply fertilizers other than broadcast, there is no better way than with the grain drill.

(3.) The seed is planted at a more uniform depth.

(4.) The seed is dropped one after another in a direct line, giving the cultivator opportunity to run very close to it, whereas by hand planting the rows are straggling and the seed scattering in the hills; thus a strip ofter a foot wide is of necessity untouched by the cultivator.

(5.) Instead of four or five stalks being clumped together in a cramped position they are distributed evenly along the row, giving the roots more room for foraging.

(6.) The rows running North and South, four feet apart, admit the sunshine to the earth and plants more freely than when planted more closely in hills.

(7.) In cultivating, those roots that extend lengthwise of the rows are never disturbed—a happy circumstance, and one earnestly to be sought.

Cross the rows with smoothing-harrow about one week after planting, not fearing that the uprooting of a few plants will be disastrous. Cultivate early, cultivate often, cultivate late, but *beware of too deep cultivation* [the italics are ours—EDS.], especially near the plants after the roots have extended. Cultivate first with a flat tooth that runs close to the row; afterwards turn the soil to and from the row, as the case requires, but leave the soil level ultimately.

Cut corn early, while the leaves are green. Husk it early, and store the fodder before it becomes weather beaten and scented by field mice. It costs us one-seventh to one-eighth of the corn crop to get it husked. The western practice of feeding from the shock may not waste more than 100 bushels in 700. Grinding costs one-tenth. Therefore, if we give 100 bushels for husking 700, and 60 bushels to the miller, we have only 540 left. It is not easy to waste corn about farm yards, even that passed undigested, if chickens and pigs are plenty. I suggest that we cut, unhusked, with a cutting machine, at least a portion of the corn crop.

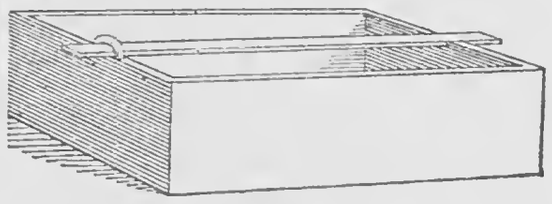
The corn field is grand to look upon in its glory, in August! It resembles an army of tasselled knights, decorated gracefully with ribbons, each member of which sports a silk pocket handkerchief.

Monroe County, N. Y.

A HOME-MADE CORN SHELLER.

T. H. HOSKINS, M. D.

I do not design to speak here of corn shelling upon the large scale, by horse or steam power, but of what may be practically regarded as hand shelling, only simple and cheap tools being used. This is the corn shelling of the greater number of New England and Eastern farmers. There are thousands of these who just grow small plots of corn for family use, with perhaps a little to feed a horse or a few fowls, or to fatten one or two pigs. Such need some simple and inexpensive way of separating the grain from the cob. They usually shell across a shovel. The little one dollar sheller of P. P. Mast & Co., of Springfield, Ohio, is likely to attract the attention of many of them, especially as it is editorially commended in the RURAL. It is really worth all that is asked for it, as a handy thing to shell a few ears for the hens, or a little seed corn. But the claim made that thirty bushels can be shelled with it in a day is absurd, and particularly so if applied to the small 8 rowed corn usually grown in New England. This variety of corn runs from 250 to 300 average ears to the bushel, which would give from 7,500 to 9,000 ears to 30 bushels, requiring that from 750 to 900 ears should be handled per hour, or from 12 to 15 ears a minute. The real speed with which the work can be carried on is at the rate of from six to ten bushels a day, and pretty tired a man will be at the end of the day who has shelled his bushel an hour. But as a matter of fact this implement will not shell the common 8-rowed Yankee corn at all. It does very good work on ten and twelve rowed varieties, and on some 8-rowed kinds with large cobs, like the Sanford; but the small 8-rowed sorts have too small a cob for the spiral-propelling points of the tool to get a "bite" on. The other chief objection to this corn sheller is that the sand-scale is not removed from the castings. They are merely lacquered over on the outside. The result is that the man who uses it half a day will get pretty sore hands. I was compelled to resort to gloves before shelling an hour with it, and wore out the gloves in five days by the friction against the sides of the sheller. Leaving off the lettering cast in the iron, and applying the castings, where they come in contact with the hands in shelling, to a good emery wheel for a few moments, would, however, remedy this serious objection.



CORN SHELLER.—FIG. 10.

After a week's use of Mast's sheller upon sweet, Sanford, and yellow corn, I have returned to my own way, into which I graduated from the shovel some 40 years ago. This is simply the use of a bar of iron laid across a box. The box is made of a convenient height to sit upon, say twelve or fourteen inches, and is eighteen by thirty inches square. This size will hold over two bushels. The bar of iron, (or better of steel) should be ¾ by ¼ of an inch in size, and a little longer than the box Put a staple sufficiently large to admit the bar into the middle of the upper edge of one end of the box, and cut a notch the size of the bar in the other end. Put in the bar, put a piece of board across the notched end for a seat, and go ahead with your shelling. I can shell any kind of corn with this rig as fast again as I can with the Mast sheller. Both hands are used in the operation, the left clasped lightly around the bar between the legs of the operator, while the ear is drawn upward by the right hand, the fingers of the left holding it firmly against the bar and slightly pushing it upwards. Shell two-thirds of the small end first, then turn and shell the butt. Two bushels of our small corn can be easily shelled in an hour, after getting a little accustomed to the manipulation. I have tried many other ways, but none have proved at once so easy and so rapid as this. Annexed is a sketch of the box and bar.

[*All of the 500 illustrations yearly presented in the columns of the* RURAL NEW-YORKER *are our own reproductions, or drawn and engraved from nature.*]

CORN.

S. RUFUS MASON.

THERE are many farmers who cannot raise corn successfully. They have a crop every year to husk out, but it seldom pays a profit, and in poor seasons never pays cost of labor. I will give such a man ten acres of land heavily manured, and will take ten acres adjoining without manure, and let the season be what it may, I will produce more and better corn than he will. I will not ascribe his failures to laziness, poor team, poor tools, or poor seed, but only to a want of appreciation of the requirements of this peculiar crop. Gardeners know well that beets and cabbages must be hoed often, they will bear it almost, if not quite constantly, and amply repay the time spent, if the work is done with judgment. Corn is even more susceptible to thorough and constant cultivation. To be sure, manure is necessary, but I find that timely cultivation is a *sine qua non*.

The time to hoe corn, is before it comes up, as soon as it is up, and every five days thereafter till the pollen begins to fall, then let it rest till the silk turns dark, and then commence again and continue till in the dough. The first cultivation must be quite shallow, the next a little deeper, the fifth or sixth deepest of all, and then shallower and shallower till laid by for the season. The object is to drive the roots down into the soil as soon as possible that they may be out of reach of July and August heats, for in those months we want comparatively cool roots, to supply an abundance of sap for the powerful growth, and the filling up of the grain. I say nothing about weeds, as the dumbest farmer knows there is no market for them, and therefore he need not grow them. [How can deep plowing drive the roots down.—EDS.]

The surface soil of a corn field should never become hide bound, it must be kept open and loose, and immediately after a heavy rain must be attended to before it bakes. The moment the top soil becomes hard, the roots rise to seek air, if it is kept loose, they get all they want down as deep as five feet or more.

Much labor is lost by undertaking but a few more acres than the farmer can attend to. Twenty-five acres can be made, by one man and team, to produce 80 bushels per acre, while the same force on fifty acres would possibly not bring more than thirty, a loss of much time and labor, as well as 500 bushels of corn, while the whole yield of the 50 acres would be 20 per cent poorer in quality.

Almost any of the many varieties of field corn, if they have small cob and deep grains will over-run the legal weight (56 pounds per bushel), when shelled at New Year's, if well grown. An ear of corn will have but its destined number of grains:—if poorly grown or if the plant is sap starved, the grains will be both small and spongy in texture, which makes light weight, while strong, vigorous growth fills every grain out full and plump, makes the grain compact and solid, and gives weight, which is the point to be aimed for.

Manure well, but all the manure in the world will not produce good corn if the plant cannot draw breath while feeding. Cultivation is the foundation of this, as well as of many other crops.

Dodge Co., Neb.

CORN ON SOD IN A DRY TIME.

There was a severe drouth through the most of New England during the past Summer. In some places corn, even on stubble ground, suffered greatly, and was a poor crop. But corn endures drouth well when the ground is well fertilized, and usually our stubble corn will be an average crop. Where corn has been planted on a reversed sod, even though liberally fertilized, the crop is often an entire failure. There has not been moisture enough from above to settle the ground and rot the sod, while the dry, fibrous matter of the unrotted sod seems to have cut off the moisture from below. The consequence was, in many corn fields, that not only the corn, but the pumpkins and the beans, which many of our farmers still plant among their corn, came to nothing, the corn in many places not standing more than 4 or 5 feet high, with hardly a nubbin, while the bean vines were barren, and what few pumpkins there were, were not bigger than a man's head. Some fields plowed with lap-furrows and well worked with the Randall or La Dow harrow before planting looked as well as stubble corn.

Orleans Co., Vt. T. H. H.

THE
Rural New-Yorker,
PUBLISHED EVERY SATURDAY.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, NEW YORK.

SATURDAY, JAN. 1, 1881.

SPECIAL NUMBERS OF THE RURAL NEW-YORKER.

THE NEXT SPECIAL NUMBER of the RURAL NEW-YORKER will be devoted to those *hardy shrubs* and *trees best suited to the grounds about the country or suburban home.* Having tested at the Rural's Experiment Grounds, during the past eight years, all of the old well-known kinds and all of the newer species which have seemed to be worthy of trial, our notes will be drawn from actual observation and experience. The next SPECIAL thereafter will be a *small-fruit number;* and the next will be devoted to WHEAT. The Rural Farm has made the testing of wheats a specialty for several years. We have now 77 different varieties growing, none of which are very well known, while many of them are new cross-breeds which have never been offered for sale.

The best of these varieties we shall cultivate with a view to placing them in our FREE SEED AND PLANT DISTRIBUTIONS, so soon as a sufficient amount of seed can be grown for that purpose.

WE find, upon looking over the Index for 1880, that the RURAL has published (under "EVERYWHERE") 665 communications from different parts of this and other countries.

CONSIDERABLE importance, as we have remarked elsewhere, is by many attached to having the rows of corn run North and South, when the seed is drilled in. The rows of the Chester and Blount were East and West.

MANY of our new readers may think that a good deal might have been said in this number about corn which has not been said. It may be remarked that the RURAL NEW-YORKER of March 8, 1879, was also a *special corn* number, and we have endeavored, in so far as it was possible, not to repeat in this what appeared in that.

AN experiment, easily tried and which would demonstrate to farmers whether it is more profitable to plant corn in hills or drills, is the following: Measure off a strip, let us say, 16 feet wide, extending entirely across the field, or, if desired, a distance only of from 28 to 80 feet, or any other number divisible by four. Plant corn in drills four feet apart and a foot apart in the drills. In another strip of the same dimensions, plant in hills four feet apart each way, four kernels in a hill. It will be seen that the number of kernels in each strip will be the same. Give the same manure, preparation and culture. We believe that most farmers who will fairly try the above experiment will entirely abandon hill culture of Indian Corn.

TIME REQUIRED FOR FIXING A NEW VARIETY OF INDIAN CORN.—Five years ago, according to memory, we made a cross between Stowell's Evergreen and the Black Mexican. Several of the kernels from this cross were of a *rose* color, Such kernels were selected and planted the next year. From this cross the rose-colored kernels were again selected and so on until last year. From last year's selection we have before us five ears. Taking one that seems to be an average of the progress made in fixing the rose variety, we count as follows:

Whole number of kernels on the ear	336
White (like Evergreen)	76
Black or dark colored	126
Rose colored	35
Variously colored	99

From the above, it would appear that at least five years more will be required to *fix* the "Rose" Corn; that is, so that all the kernels shall be uniform in color and size.

GREAT POULTRY SHOW.

AT the one which recently came off at the Crystal Palace in England, there were 800 exhibitors, showing 3,865 pens. Of these, 2,200 were of cocks and hens, 122 ducks, six geese, seven turkeys and 1,530 pigeons.

We are surprised to find so few geese there, as England is a great goose-breeding country. The flocks there frequently have hundreds in them, far exceeding those in America; but as for turkeys, there are few compared with ours. In pigeons they excel, and the varieties are astonishing—one can hardly keep the run of them, so many new are brought out from time to time there and in other parts of Europe.

At the later Fat Cattle Show at Birmingham, the poultry and pigeons exhibited numbered 3,062. So far as we can judge, these seem to be considerably on the increase in England, and it ought to be the same in the United States. Considering their flesh and eggs, hens, at least, are the most profitable stock we can keep.

IT IS NOT MANURE ALONE.

Dr. Sturtevant, who has studied corn as closely as any person we are acquainted with, once told us: "Were the average farmer to be asked to name the one thing most essential in growing a large yield of corn, he would reply 'manure;' and yet there is no greater mistaken belief current than that applying manure will produce the large crop." And this is our own belief from our experience in raising our large yields of Blount and Chester. It is strengthened by the fact that one of our best farm neighbors applied at the rate of 1,200 lbs. per acre of Lister's Chemical Fertilizers on the half of a seven-acre field, besides a handful in the hill; and twenty-five loads of farm manure on the other half, with the same chemical fertilizer in the hill, and yet his yield was not over 80 bushels to the acre of shelled corn. His field was naturally and by better treatment a more productive field than ours. His corn (White Dent) was planted in hills four feet apart, four kernels to the hill. The corn was hilled up and the land cultivated with a plow only. WHY did we raise over 150 bushels of shelled corn with 350 pounds of chemical fertilizer, while, with over 1,200 pounds, he raised but 80 on a naturally more fertile field?

A HIGH-PRICED RAM.

THE owner of a ram exhibited at a late show at Melbourne, Australia, was offered and refused for him £1,500 (say about $7,200 of our money.) His breed is not reported, but we presume it was one of the varieties of the Merino sheep as on account of the numerous large flocks of them in that country, and the greater value of their fleeces, they have been held at far higher prices than mutton sheep imported from England.

American Merinos have found great favor in Australia for some years past, and quite a number have been exported thither. They yield more wool for their weight than any other class of Merinos, and although of not quite so fine a fiber as the Saxon or Silesian, it is still fine enough for all useful purposes, and counts as the most profitable fleece, probably, upon the whole, that is grown among the flock-masters.

We believe rams of this sort bred in Vermont, have been sold at a higher price than was offered for the above in Australia. If we recollect aright, $10,000 to $15,000 have been refused once or twice for such. Whether the offers were in good faith we do not know, and do not see how rams costing anything like the above sums, can pay a profit from their breeding, any more than Short-horn cows and bulls at $10,000 to $30,000. Such prices seem to us altogether exorbitant, and no prudent breeder can be justified in paying them.

SHALLOW CULTIVATION FOR CORN.

WE cannot think that there is any kind of cultivation that cuts or displaces the roots of corn that can increase the yield of *grain*. We want to encourage root growth in every way. We want to supply the roots with every condition favorable to their healthy existence. They supply the grain through the leaves and stalks with the food which is necessary to their fullest development.

From our own experience, we condemn the deep working of the soil after the roots of corn have begun to spread laterally. Disturb them not any more than we would those of a tender flower during the hot sunshine. Cultivate shallow—the shallower, the better, so that the crust is broken and germinating weed-seeds killed. Keep the surface soil mellow, that it may drink in the air and moisture, which are both drink and food for the tender root fibrils. Root pruning in the case of *perennials* of vigorous wood growth induces fruitfulness. But it not the less impairs vitality. An earlier production of fruit is thus secured. But more than is gained in this way, is, perhaps, lost in later years.

The corn plant is an annual and needs all of its roots for the never-ceasing labors of a short, busy life. If our "corn grows to stalks and leaves," instead of ears, this is not because it has too many roots, but because from want of sunshine or suitable nutriment its equilibrium is destroyed, and its energies are spent in the least laborous and exhausting of two labors.

HAPPY NEW YEAR.

To-day, as greetings are exchanged between friend and friend, while all hearts are happy, and faces radiant with the joy which the first day of the year is peculiarly fitted to bring, the RURAL pauses a moment from its corn deliberations to wish its readers, one and all, a HAPPY NEW YEAR! The old year, with its opportunities improved and unimproved, with its duties performed or unperformed, with its sorrows and its joys—is gone, and another page of our life history is written.

To-day, the poet's words come to us, in the fullness of their meaning, and we realize, indeed, that

> "The corridors of Time
> Are full of doors—the portals of closed years;
> We enter them no more, though bitter tears
> Beat hard against them, and we hear the chime
> Of lost dreams, dirge-like, in behind them ring
> At Memory's opening."

And, yet, we would not hastily dismiss the old year from our thoughts, for it has been laden with unusual blessings, especially to the great body of "tillers of the soil," who have reaped a full reward in abundant harvests, and good prices. Recovering from the discouraging effects of a small remuneration for almost unceasing toil, the rural population have, now if ever, great reason to be happy, and if they make "economy and industry" their motto, they may reasonably expect a continuation of the present era of "good times." Economy—not parsimony—is what farmers, as well as others, must practice if they would prosper, and this, combined with an advanced enlightenment and a laudable ambition to make farming more of a profession, will make farmers happier men and farming a more attractive pursuit.

With the assistance of our able corps of contributors; with abundant means; with the valuable and trustworthy information gained from the Rural Experimental Grounds; with a careful and concise statement and discussion of the various subjects pertaining to the farm, garden and household, and with the promise of the largest list of subscribers the RURAL NEW-YORKER has ever received, we shall continue our best endeavors to make this journal a reliable source of information on all topics of which it treats, so that it ever may find a hearty welcome from its subscribers and friends. To those, then, whom we, to-day, greet for the first time, we extend a most cordial welcome, while to such as have been with us in the past, we proffer our sincerest thanks for their support and encouragement, wishing, again, for one and all, the HAPPIEST NEW YEAR of all their lives.

BREVITIES.

"OH, anybody can grow corn!"

HOE! Everyone, hoe! Give ear to corn's talks.

OUR last special devoted to corn was March 8, 1879.

DR. HEXAMER'S method of raising sweet corn as occasionally followed is original and peculiar.

MANY are fond of blowing their own trumpets. The best horn to blow is the horn of plenty—corn-ucopia. Blow that!

IT seems that the American Entomologist has been abandoned altogether. This is a surprise and a disappointment. The magazine was well got up—well edited.

IF it were as hard to breed good seed, and it required as long a time as to breed good animals, there would be some excuse for our indifference as to the former.

THERE is a ready sale for the cobs of such kinds of corn as Chester Co. Mammoth. They are manufactured into pipe heads. Smaller cobs do not so well answer the purpose.

DR. STURTEVANT thinks, after careful investigation, that we have not as yet one strictly good seed corn in the market. He thinks Blount's the best, though not for New England culture.

IT appears from Mr. Brown's letter (Butler Co., Kansas) that he has raised at the rate of 112 bushels of Blount's Corn to the acre. He has a good word to speak for Chester Co. Mammoth.

THE question as to whether it pays to sucker corn has been experimented upon in various places—notably at the Michigan Agricultural College and at Cornell University. The results agree in showing that suckering does not pay.

THOSE of our friends who next season adopt the methods of corn cultivation recommended in this number would greatly oblige us if they would make memoranda of all notable steps and results and send them to the RURAL for publication.

The RURAL NEW-YORKER *gives information respecting all hardy flowers, trees and shrubs—all sorts of bulbous plants—house plants which are best adapted to the Country Home. All such plants are tested in the Experiment Grounds of the* RURAL NEW-YORKER, *and impartially estimated.*

THE A. A. commences the New Year reduced in size not less than one-quarter, according to our reckoning. We must congratulate our esteemed contemporary upon—er-er-upon its—what shall we say? Well—we simply congratulate our esteemed contemporary.

ACORNS FOR POULTRY.—In situations where acorns—and children to collect them—are abundant, the following German recipe for preparing poultry-food is said to serve a good purpose: "Roast the acorns, grind them to a coarse meal, and bake the meal to bread."

IT is a pity that some simple remedy could not be hit upon to destroy the corn worm which in many parts of the North, West and East is every year becoming more plentiful and destructive. Of our several varieties of corn, the Yellow Flint was most infested. It has been suggested that late Fall plowing would destroy many of the chrysalids.

WE have reserved the particulars of the cultivation and treatment given to our corn-fields during last season for this number. We claimed that both the Chester County Mammoth and the Blount's were the largest yields ever before produced when the *cost* of *their production* was duly considered, and we have since seen nothing which has invalidated this claim.

[*The* RURAL NEW-YORKER *gives much space to the decoration of the home; to Domestic Economy, to the Agricultural news of the world. Its market reports are made a specialty. Its first aim is to supply, in one journal, all the reading matter needed in the country or suburban home.*]

IT is well to bear in mind that the Yellow or White Flint Corn may be planted close to, or in the midst of, such varieties as Blount or Chester Co. Mammoth without any fear that the two will mix. The Flint sheds its pollen a month before the others. But if the Blount and Chester were planted near each other they would be certain to mix, as their season of bloom is nearly the same.

WHEN corn is planted in drills, the drills should run North and South, it is reasonably said. In this case the Eastern part of the corn receives the morning sun, the Western the afternoon sun. Were the rows to run East and West, the North side of the rows would receive sunshine only at midday. To what extent the crop is affected by the direction of the rows is a fit subject for experiment.

WE have been looking over a great number of experiments with different kinds of concentrated fertilizers upon corn. The conclusion that must be drawn is, that while bone has shown the best effects in a majority of instances, in many others it does not appear to have produced any appreciable effect. We can only repeat what we have already said many times, that this is a question which each farmer, by careful observation and experiment, must determine for himself.

WE would remind our readers that the Winter is the best time to destroy the tent caterpillar. The nests of eggs can now be plainly seen encircling the small twigs, having the appearance of a dark polished ring. They are easily removed by splitting them with the thumb nail. Go over the orchard carefully, collect the nests in a basket, and burn them, but not in the kitchen stove. We have known this to be done, and the whole household driven into the open air in consequence of the horribly offensive smell.

IT is said that "a merciful man is merciful to his beast." If this be so, can he be a merciful man who leaves his cattle exposed in the pasture lots night and day, to the inclemency of such weather as we have experienced during the past month or so? And yet, in a large dairy district on the Harlem Railroad, cattle are exposed in this way in such numbers that one might be justified in concluding it was the rule and not the exception. Stacks of hay are left out for the cattle to feed on, but the poor beasts have a hard time of it, especially where the stacks are covered with snow; and their frowsy hides and pitiful looks clearly show that they suffer. Those who indulge in this kind of cruelty excuse themselves by saying that the animals gradually get used to it, and do not mind it; but the looks and motions of the poor animals are an eloquent reply to such shallow reasoning. Self-interest, at least, should teach these men that there is no gain but great loss in this unfeeling exposure. The experience as well as the teachings of the advanced agriculture of to-day all go to show that shelter for domestic animals is profitable for both man and beast.

[Continued from page 7.]

THE BUSHEL VS. THE "BUSHEL OF EARS."

In the "Corn" number of the "Rural" seems an appropriate place to enter a protest against the practice of quoting corn yields of "bushels of ears." The legal measure everywhere is the bushel of shelled grain, and a bushel of corn should always mean that quantity which will give the legal measure. An illustration of the inconvenience, to say the least, of this practice of calling two different measures by the same name, has just been brought to light by the wide-awake secretary of the Ohio State Board of Agriculture, W. I. Chamberlain, Esq. In the first "Ohio Crop Report" just issued by Mr. Chamberlain, under the auspices of the State Board of Agriculture, he calls attention to the fact that "the very heavy averages (of corn) per acre are nearly all in North-eastern Ohio," and suspects that "at least in some cases 'bushels of ears' are reported instead of bushels of shelled corn." By referring to the tables accompanying his report it is seen that Summit county claims an *average* yield of 65 bushels per acre; Trumbull county of 57 bushels, and Stark county of 52 bushels; while of the counties containing the famous Miami Valley, Butler returns but 38 bushels, Miami 37 bushels and Montgomery 34 bushels. In the northern counties the "bushel of ears" is often heard of, in the southern ones, never: hence Mr. C.'s suspicions, while the averages claimed for these northern counties, though not above what ought to be made, are certainly higher than have yet been made by any but a very few of the best farmers. C. E T.

RAISING CORN IN MISSOURI.

In raising corn here we follow two plans: If we have sod or pasture land or land that has been in wheat or oats the past season, we plow in the Fall and let it lie until Spring, when the ground is again plowed and furrowed with a shovel plow both ways; then the seed is dropped and covered either with the hoe, a shovel plow, or a large rake, if a horse is used. In case the land has been in corn the previous year, then it is plowed in the Spring and planted in the same way. In cultivating, double shovels are used almost altogether, unless riding or walking cultivators are employed. In this State very few, if any, diamond plows are used, and, as a rule, the ground is left level, very few believing in hilling up. The main idea is to keep the surface stirred up and the corn clean of weeds.

As a rule, bottom lands are the best for corn, as most of our soil is rather light and gravelly on the ridges, and, in case of a protracted drought, the ridge land seems to suffer first and most. This fact was very plain this year; for, while we had an unusually dry Summer, we had a reasonably fair crop of corn on bottom land, while the ridge land was burned up, and in many cases, it did not yield ten bushels to the acre. Corn is one of the main crops here, and the general opinion seems to be that level culture is the best, both for the yield of corn and also for the land.

N. J. SHEPHERD.
Miller County, Mo.

JOTTINGS.

I SEE by the Tribune the editor of the RURAL gives the yield of Blount's Corn as 150 bushels per acre, and claims this extraordinary yield was largely due to level culture. Does he know, or what evidence has he for the belief, that level culture tended any more towards producing this large yield than if anti-level culture had been practiced. If different methods of culture had been adopted in different portions of the same field the comparison of the products of the different portions might have appeared to favor level culture, but as the whole plot was treated alike I fail to see why or how the kind of culture should receive this credit. I hope the Editor will give the reason for the "faith that is in him."

[The above criticism is quite merited. See notes from the Rural Farm. EDS.]

THE BURLINGTON COUNTY, New Jersey Agricultural Society, offered premiums on best six acres, or more, of corn, grown in the County. As usual, the past season, the Committee to award premiums were called to view and examine quite a number of fine fields of corn. The crop that was finally decided to be the best, was planted in April, in hills 4½ feet apart each way, three to four stalks allowed to grow in each hill. Variety, common Yellow Gourd seed. The Committee husked a number of hills, supposed to be an average, and the weight of the corn in the ear averaged four pounds per hill, which, allowing 70 pounds to the bushel, would indicate a yield of 123 3-7 bushels per acre; at the time the corn was weighed, it was quite ripe, and in condition to husk and crib. The field that was awarded the 2nd premium, was planted in May four feet apart each way, three stalks allowed to grow to each hill. The samples selected by the Committee, averaged 3 1-5 pounds of corn per hill, and the hills being closer together, would show a yield of 8,710 pounds per acre, or, at 70 pounds per bushel, a yield per acre of 124-3-7 bushels, which is more than field No. 1 figured, but the corn in No. 2 was greener, not ripe enough to crib unless in a very favorable location. Neither field had extra manure or culture. The owner of field No. 2, husked a number of hills, which he considered not over an average, which indicated a weight of 3¾ pounds per hill, or 145.57-70 bushels per acre. As an evidence of the shrinkage of new corn it may be stated that 37½ pounds of the corn on the cobs from field No. 2, in a dry, exposed place shrunk in 17 days to October 6th, to 27 pounds—in next 14 days to 25½ pounds, and in next 30 days to 25 pounds. J. S. COLLINS.
Moorestown, N. J.

[From our own experience—we have no confidence whatever in this, or in such methods of ascertaining the yield of corn, and we hope our readers will not accept such estimates as of more than passing value.—EDS]

NOTES.

FOR the benefit of new subscribers we here present a reduced cut of the Blount Corn from the original, published in the RURAL NEW-YORKER of March 8, 1879. During the season it was one of the kinds offered in our then Free Plant and Seed Distribution. (See page 6.)

IN planting sweet corn, farmers are very apt not to make late plantings, so as to supply the family with green corn until frost. It is generally safe in this climate to plant the early kinds as late as August 1st.

THERE is no preventive that we know of for smut in corn. The spread of this fungoid parasitic plant—botanically *Ustilago maydis*—may be measurably prevented by going through a field as soon as the affected ears can be determined, pulling them off and burning them. This plan no doubt would consume more value in time than the smut, if left to itself, would do harm.

JOHN STANTON GOULD, according to Prof. Atwater, once stated that he has seen the roots of Indian corn extending seven feet downward. Prof. Johnson states that the roots of corn which in a rich and tenacious earth extend but two or three feet, have been traced to a length of ten or even fifteen feet in a light, sandy soil.

GEN. DIVEN, of the Elmira Club (N. Y.), speaks of having raised on seven acres of old meadow, without manure, 1260 bushels of ears, or, allowing two bushels of ears to one of shelled corn, 90 bushels of shelled corn to the acre. Mr. McCann remarked (as reported in the Husbandman), that he did not see how such crops of corn could be raised. He spread 52 loads of manure on one acre and got only 208 bushels of ears. Evidently, the old pasture sod of Gen. Diven was better for the corn than the 52 loads of manure used by Mr. McCann.

THE EXPERIMENT RECORD, after referring to our corn crops of last Fall, says:

"But the editor has 'a strong faith' that he can repeat the same yield 'again and again.' That is a grand point, but too seldom thought of by farmers. To win a large result by thoughtful effort, and then to repeat the same indefinitely through following years, that is the ideal perfection of culture that we have long been working for, and have endeavored to point farmers in the same direction. That is the way to make farming an *exact science*, a result which we have claimed to be possible and which is now clearly foreshadowed by facts and figures that continually multiply around us, and that we are endeavoring to accumulate and diffuse.

Now let the RURAL go ahead in its noble work, and let other journals and other farmers everywhere take the hint, not only for corn and wheat, but for all food staples, and let them take up everywhere the universal refrain, *more food from an acre, and less cost for production.*

FEELING an interest in your paper and your experimental garden, I send an ear of corn for experiment and name. I bought of a neighbor last Spring one bushel of ears and planted five acres with it, without any fertilizers, and harvested 600 bushels of ears. It was planted the 8th of May and cut the 10th of September, in good sound condition. Please try it and report in the RURAL, and oblige

Lucas Co., Ohio. OTIS FORD.

[It is hard to distinguish this from the Chester Co. Mammoth in appearance. The above yield would be not less than 65 bushels of shelled corn per acre.—EDS.]

DR STURTEVANT has tried some experiments with corn stover which lead him to think it does not pay to strip off the leaves in feeding. He finds the part rejected by the cows is under—certainly not over—ten per cent. Now will it pay to cut ten tons of stover in order to make the cows eat one ton in ten?

He thinks that corn stover, if cut early and put into the barn, or under cover, before it is washed by the rains, is worth six-tenths as much as hay.

He would cut as soon as the corn is glazed.

The great question as to concentrated fertilizers is, whether we can buy them in the market and raise our corn, and not deteriorate our land. Dr. Sturtevant says that he has demonstrated that this can be done in so far as 5 years of trial can be considered a test. The first year he manured 8 acres; the second, third and fourth, 9 acres, and the fifth, 6 acres. The result was that his land gave him 4 tons of Hungarian grass this, the last year, per acre.

"I WISH I was a geese,
All forlorn, all forlorn.
For they possess their souls in peace,
And accumulate much grease,
Eat'in' corn."

SIXTEEN INCHES LONG.—At the Connecticut meeting of the Board of Agriculture, at New Britain, Dec. 15, 16 and 17, there was exhibited an ear of the Beuton Corn sixteen inches long. I measured it and will vouch for the fact. This is 2 inches longer than the longest exhibited at the Centennial, and 1 inch longer than I have ever seen before.

E. LEWIS STURTEVANT, M. D.

ANOTHER query suggests itself, i. e. whether the application of the fertilizers at three different periods was any more potent than if applied all at once? Did the crop get as much relative nourishment from the last application as from the first? Or did it get as much from the last as it would it it had been applied with the first? Would any virtues have been lost if all were applied at the same time? Who can tell?

[Should not we have to consider the solubility of the fertilizers and the amount of rainfall after the application? EDS.]

STOOKS VERSUS STACKS.—Why will editors persist in using the word stook in reference to unhusked corn? I know they are presumed to know everything, but in this instance I think they are wrong. Stack as thus applied is an Americanism and to the manor born. Stook is English, meaning a collection of 15 bundles or sheaves and corresponds to our American term shock, meaning the same. I deprecate the custom so prevalent of using foreign terms to express American ideas, and protest against the use of stook and shall persist in writing stack, and proof-readers and editors may change it if they choose, but it is annoying to me to read it and to appear as not knowing any better. KIT.

An Extra-long Variety of Yellow Flint.

Several have brought to the RURAL office ears of a yellow flint corn which are longer than the usual eight-rowed flint, with a smaller cob. The illustration, figure 6, shows somewhat these two peculiarities. The cob is, in fact, too small, as 5 out of every 6 would break in two when shelled.

It is offered by seedsmen under the name of "Improved Eight-rowed Yellow Flint."

SWEET CORN.

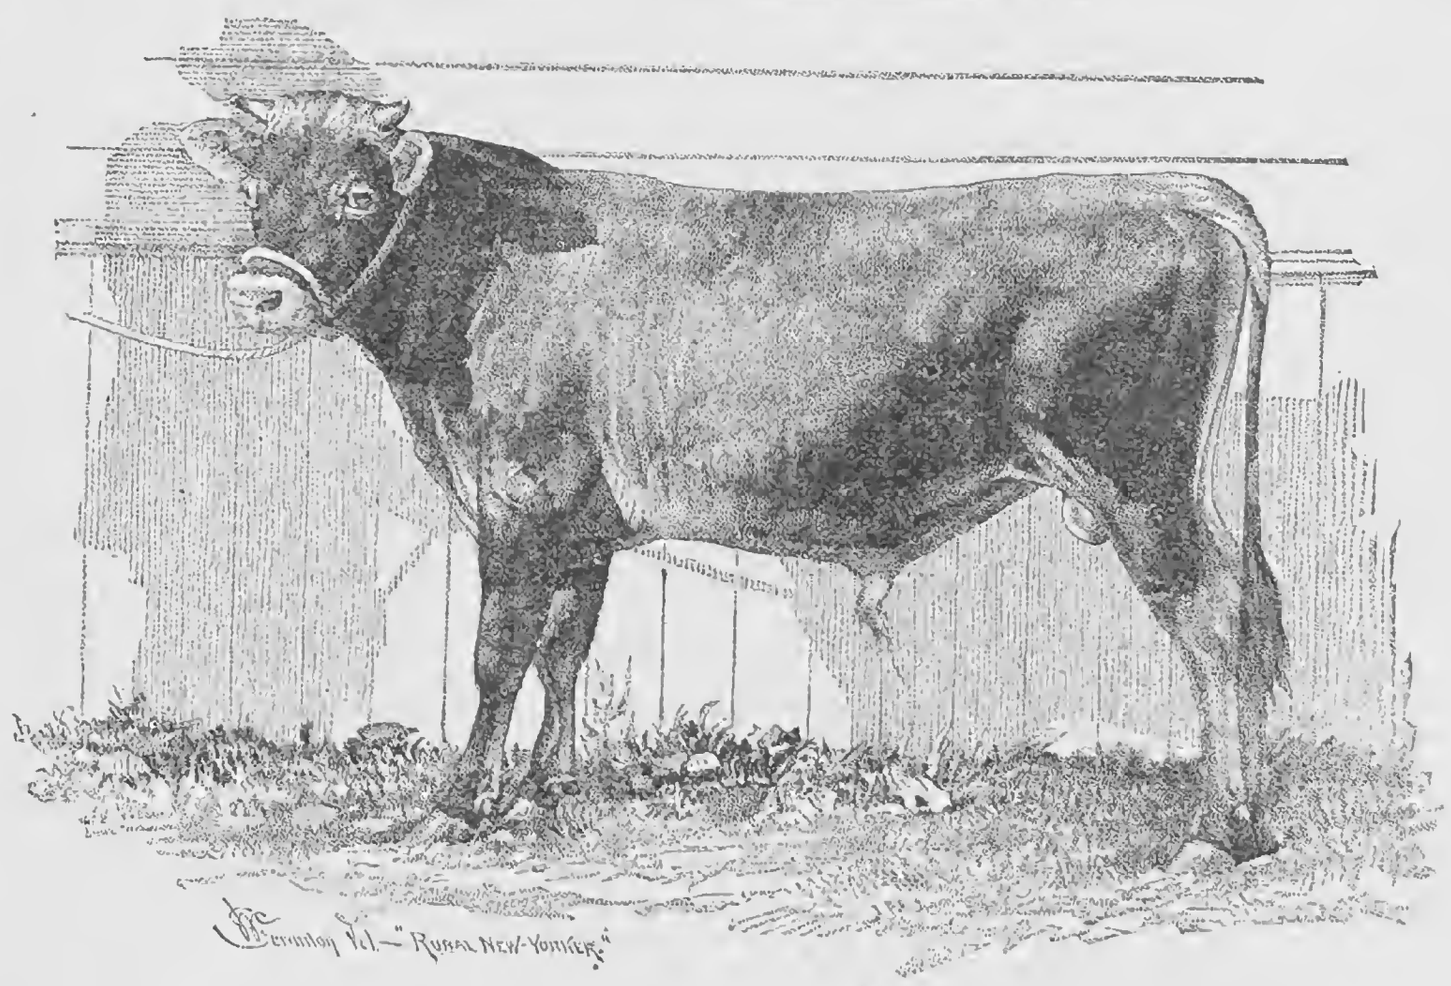
E. WILLIAMS.

THE MEXICAN SWEET.—What funny looking corn! It is not sweet corn is it? I never saw sweet corn that color before! I should not think such black looking corn was fit to eat! What makes it so dark? What is the matter with it? The above are but samples of the remarks made by guests at our table every season for years past, and every one without exception on being assured the coloring was natural and that it was really and truly sweet corn, have, after tasting for themselves, unanimously pronounced it the very best sweet corn they ever ate.

While many are prejudiced in favor of a white article all admit the superior quality of the colored. One lady asked this past season why she had never seen such corn in market and said it was almost impossible to get corn that was really sweet. Would you have bought such looking corn if you had seen it? I asked. No, because I did not know it was sweet. And for the same reasons others would not purchase it till, like you, they became acquainted with it and could overcome their prejudice against its looks. There is, doubtless, much corn offered in our markets in a green state that is not genuine sweet corn, and much that loses its sweetness by heating in transit long before it reaches the table of the consumer.

The Early Burlington, an early dwarf white field corn is sometimes grown quite extensively for market, and though quite sweet for a field variety, will not compare with the shriveled sweet kinds for which it is no doubt often sold. And right here is where the color of the Mexican is of advantage, proclaiming at once its identity. I think it must be 15 or 20 years since we first obtained the seed, and we long since decided it was the sweetest and tenderest of all the sweet or sugar varieties we have ever grown. It is also one of the earliest.

THE TRIUMPH SWEET.—Of the white varieties I place the Triumph at the head of the list as far as my experience goes. It is tender, sweet and excellent, the ears of good size, and it is very productive, generally two good ears on the stalks, and sometimes three. Planted at the same time as the Mexican it comes in season just as the Mexican is over. I have not tried all the known kinds, but Darling's Extra Early, Crosby's Sweet, Excelsior, Campbell's 60-Day Sugar, Stowell's Evergreen, Moore's Early Concord, Mammoth Sweet, Trimble's Farmers' Club and Egyptian are among those I have tried and our preference, so far, is in favor of Mexican and Triumph



JERSEY BULL DIAVOLO.—FIG. 11.

If there are any *better* kinds I have yet to find them.

SWEET CORN FOR SOILING.—I always use it if I have the seed and I generally manage to save enough for this purpose. This last Summer after the drought had ruined our hay crop I put in all the sweet corn I had left, some of it several years old, and it came nicely. The result is several tons of excellent fodder with "nubbins" enough to make the cattle and horses appreciate it. With this and the stalks from our field corn I hope to bridge over the feeding season till grass grows again.

PLANTING SWEET CORN.

As Winter passes away and Spring first ventures to appear, all persons fortunate enough to be possessed of a garden, large or small, become at once busy. First in preparing the ground, then in sowing seeds of the first early vegetables, and finally, later on, in corn planting. Then comes the perplexing question, which is the very best of the many known varieties to plant? How many have asked this very question, and how difficult a one to answer.

Many believe that one variety alone should be sufficient, but then this one is to possess all the qualities of the four or five varieties which every well-kept garden should contain. How difficult it is to bring about such a result none will know till it is accomplished. Of such a variety I do not intend to speak, but rather of the four or five at least necessary to any kind of a garden.

Should the desire be a corn to come very early, to outstrip, perhaps, any of your neighbors, then plant by all means the Minnesota. The ears of this variety, though diminutive in size, are very sweet, and so very early in the season will be found very acceptable for the table. The Concord corn, though maturing some two weeks later, produces larger and very sweet ears, so for second crop this variety should be planted. For a third succession, a fine large and very white corn known as Hickok, may be planted and is sure to give satisfaction.

Did the Evergreen mature as early as the Minnesota, it might be ranked as the first of all good sweet corn; but coming late as it does, we have to place it last in line as far as precocity is concerned, but first, indeed, when size and quality are regarded. A garden properly planted with the best and purest strains of the foregoing varieties, would provide its owner with a succession of good corn throughout the season. Another variety, most appropriately named Mammoth, on account of its extraordinary size, matures somewhat later than Evergreen, though hardly as sweet as this variety; still by reason of its huge proportions it is regarded by many as very desirable.

Market gardeners, I think, would do well to plant the Concord for an early crop, to be followed by the Excelsior, and finally the Evergreen and Mammoth. The Hickok being now but little known, I must recommend it to all persons who CAN vegetables as the very best variety for this purpose, being of a pure white color and very productive. F. W. B.

CHEAP SWEET CORN.

DR. F. M. HEXAMER.

BY some accident I discovered the cheapest and easiest way of growing sweet corn I have yet heard of. A box containing several packages of different seeds,—sweet corn, bush beans, cucumbers and peas, the latter largely predominating—was carelessly left open, so that mice got into it. A high festival they must have had, gnawing through the bags, mixing up the entire lot and destroying as much as they could, before the mishap was discovered.

We were just then making garden, and it occurred to me, that the best use to make of these mixed seeds might be to sow them instead of peas alone, anticipating that the more tender kinds would fail to sprout or be killed by frosts, as it was several weeks before the season for planting corn and cucumbers in the open ground.

The peas came on finely and produced a full crop. Beans appeared a little later and furnished a dish sooner than the regular sowing. I had almost forgotten about the other seeds, when to my surprise an occasional cucumber vine showed itself, and the corn pushed vigorously up through the withering pea vines. The first peas, the first beans, as well as the first ears of corn from the garden, were picked on this row—a vegetable garden in itself. Encouraged by this success, I have often since repeated the experiment, in part, at least, by sowing early corn and peas in the same furrow. The corn does not interfere with the peas, as the latter have already completed their growth when the corn requires the entire ground, and the pea vines are rather beneficial to the young corn, affording protection against frosts. I do not advise to rely, for the main crop, solely on this mixed corn and pea growing, but as the loss of the seed, even if the corn should fail, is not worth mentioning, and as no extra ground and labor are required, and an additional source for a successive supply of sweet corn is opened thereby, the experiment is worth a trial.

Early Minnesota and Dolly Dutton are the earliest and best early varieties I have grown; Darling's and Moore's Early I found the most desirable for medium, and Egyptian, or Washington Market for late crops.

TRIUMPH SWEET CORN.—In a test-trial of the different varieties of Sweet Corn which I have been prosecuting for some years, I have found Triumph to be the best, all things considered for this part of the country, at least. True, it is not so early by a few days as Early Minnesota, Crosby's Early, and a few others, yet it is *early*, and its ears so large and full, (and with all it is so prolific), one is well repaid for the necessary waiting. In richness and tenderness it nearly, if not quite, equals that superb, old, late sort—Stowell's Evergreen. Should I confine myself to a single variety, that variety would be the Triumph. L.

[*The actual value of our seed and plant collections distributed as they have been and are over our entire country very soon becomes known. As they are distributed without charge, it is apparent that we could have no motive in selecting those kinds which would not reflect credit upon this journal.*]

RURAL SPECIAL REPORTS.

N. Y., Medina, Orleans Co.—I planted, May 13, 1880, a piece of land, eight by thirty rods, to Blount's corn, on last year's soil after beans, fitted in the usual manner and without fertilizer of any kind. I planted it with a hoe one foot by four feet apart, one kernel in a place, cultivated it three times and hoed it twice (flat cultivation). I picked my seed for next year September 1, and cut up the balance October 1. I have just finished husking and it measures 314 bushels in the ear. Last year I, for my prize corn, selected some of the best land I had and fertilized it to the best of my ability. This year I selected some of the poorest land I had, land that has not been fertilized in any manner in 18 years, and when you consider the drouth, wire worms, poor soil and no fertilizer, I am much better satisfied with the result of my experiment this year than last. WM. H. CHAMBERLIN, M. D.

[It will be remembered that Dr. Chamberlin took the RURAL NEW-YORKER gold prize for $100 for the greatest yield from the Blount's corn which we sent out in our Free Plant and Seed Distribution of 1878-9. EDS.]

IND., Hall's Corners, Allen Co., Dec. 10.—As you request a report from me on my boy's acre of Blount's corn, I will try to make one as near as possible. In the first place, the soil is a dark, sandy loam, not drained, plowed once and then surface plowed and well pulverized with harrow. Ten loads of barnyard straw manure were used on the acre. Checked three feet by 3 feet 8 in. Planted about 8th of May with four kernels to each hill; when well up thinned out all suckers, leaving only three stalks to hill. It suffered from wet in June and from drought in August; it was plowed for level culture twice, but the wet changed our minds and then we used a single shovel plow twice, once each way, and hand-hoed once. Then the weather became dry and harvesting had to be attended to, consequently it was so dry we did no more to it. Very heavy rains the latter part of August caused about one-half to fall flat to the ground. Now for the result. We have it all cut into stooks 8x8, or 64 hills each. In husking we have an average of 169 pounds, gross, to stook. There being 3,960 hills, consequently we have 61 54-64 stooks, or a fraction over 148 bushels shelled corn at 70 pounds per bushel. Corn cut up by 15th September, nearly all husked at present, and I think shelling the corn would increase the yield. I am satisfied we will have more corn if all was shelled and weighed.

Respectfully, W. H. HARTER.

[The above is a very surprising yield, and, under the circumstances, hard to believe. We would by no means doubt the statement of Mr. Harter, but it would carry more weight if the yield had been measured and certified to by well-known persons.—EDS.]

N. C., Brookston, Warren Co.—Last Spring the Editor of the RURAL sent me a package of Cuzco corn with the request to "plant, save ears, and report." The first was done April 19, the second I could not do, as there were none to save, not even a respectable cob. On the 22 stalks there were four ears set. It attained a hight of 15 feet, throwing out roots at each joint for a long way up. One stalk which I have saved has roots two inches long at the thirteenth joint five and one-half feet from the ground. This one grew partially inclined, however; those in a perpendicular position were not quite so prolific of roots. To sum it up, it is a failure here. Neither is the Blount's Prolific adapted to this section. From seed saved last year I planted an acre or more. The returns of fodder were much better than our common corn, just how much I cannot say, as I did not weigh it. A large proportion of the stalks produced three ears or rather "nubbins." Less than 50 were filled out at both ends, which is a general fault with all varieties of corn here, but the Blount is the worst of all. M. B. P.

CHESTER CO. MAMMOTH.—Blount's White Prolific Corn, as will be seen, bears a single ear in each axil or in several of the axils of the leaves. Not so with the Chester. Generally, as is elsewhere remarked, it bears but one large ear. Occasionally, however, it bears two and very rarely three or four ears, all of them growing out of a single axil as is shown in the engraving.

IMPROVEMENT OF CORN.

PROF. A. E. BLOUNT.

THE object of all practically successful farmers is to raise from a given extent of land the largest quantity of the most valuable and marketable products at the least cost, in the shortest possible time and with the least injury to their soil.

Corn is always marketable and should, in all cases, pay the farmer at least enough to encourage him to make it better, improve and raise not only a better quality of grain but of fodder. When compared with other crops it is not considered exhaustive, especially on deep alluvial soils. The better the quality he raises the less exhaustive. It is a curious fact that the finer the farmer makes the soil and the more prolific the less injury it does, while the coarser and grosser the cultivation the more injurious. Hence, it not only pays the farmer to improve his corn in order that he may make greater yields and get higher prices, but to save impoverishing his soil.

That corn can be greatly improved—and much more easily than other crops—and that it can be made more prolific and of finer quality and with less expense than it now is, are facts none can dispute.

A careful examination of a hundred fields of corn in different localities will show any one that not even one per cent. of the stalks or ears is perfect. There will always be found some defect. It will not be uniform; too coarse, too late tasseling or silking, ears too small, cob too large, grain too light, rows too irregular and not prolific enough.

No corn can be called prolific that produces more than nine pounds of cob in every seventy of ears, nor can a crop be called profitable for grain whose stover amounts to over 65 per cent.

When a large amount of fodder is produced—as is the case on bottom lands—the grain is sacrificed; but when the largest possible quantity of grain is made the producer's crop stands about seventy-one per cent. stover, and twenty-nine per cent. grain.

It is very evident to every one that it takes about three times more plant food and labor to produce the stalk than it does the grain that grows on it. Good farmers make a little better showing than this, however, in some States, while in others the crop stands stover, ninety per cent.; grain, ten per cent.

Corn requires as much attention as the farmer's $1,000 stallion. He never neglects him. Every want is satisfied, while the demands of his crops are never once considered—cultivation and a little common-place fertilizer excepted.

Besides the regular routine of corn culture, the farmer would do well to plant pure, sound seed in good ground, giving it early attention and late, feeding it as regularly as he does his stock.

Corn wants room, something to feed upon; it wants cultivation up to a certain time, and then it demands rest. The atmosphere can in no way be used as an agent to improve the crop; the farmer must make the soil the avenue to supply it with necessary food.

By crossing varieties that have fine and nutritious properties of their own; by keeping them from being adulterated, as it were, by Pharaoh's thin ears and blasted; by selecting and sowing the "fittest," as stockmen do, the corn crop, all over the world, could be made far better and more profitable. In corn, as well as in all other vegetables, and as in the animal kingdom, coarse and fine specimens are found with good and bad qualities, sluggish and vigorous habits, and inferior and superior points. The law that "like produces like," although by no means true in all things, must be respected in the improvement of corn. The stalk can be made smaller or larger, shorter or taller, the cob can be lessened and the grain on it increased, its color changed to suit the taste, the ear and shank shortened and lengthened, single or many ears upon the stalk, and a hundred more changes can be wrought if the farmer has the inclination and patience to give it his attention.

Corn is so remarkably susceptible to change, so tender yet so hardy, so easily turned out of its course, even in one season, that the slightest attention or neglect will make it a lucrative crop or a failure. The main points, then, for the farmer to observe in the improvement of corn are those that cover the rules to make a larger quantity, a better quality, a more abundant yield, in a shorter time and at a less expense.

Farm Manager Colorado State College.

CLASSIFICATION OF CORN.

EDITOR RURAL:—You have informed us of your intention to devote a number of your excellent paper to Indian corn. While others discuss the native country of this noble cereal, and may cite Longfellow's authority for the aborigines of this country having dedicated it to their god, Mondamin, as proof of its American origin, and while others, with equal confidence, assign it a birth place in the East, or even in the "dark continent," and while most of these who contribute to the literature of the subject by detailing their several modes of culture and treatment—permit an old corn-planter to make a few suggestions as to the classification of the very many sub-varieties that have been observed, as a result of long cultivation, accompanied by crossing and careful selection.

Desiring to effect an arrangement of these diverse forms of variation, something was attempted by the writer already in 1858, when responding to a circular for information that was issued by the Secretary of the Ohio Board of Agriculture, Mr. John H. Klippart, and this was afterwards adopted in part by him and published in the appendix to his book on the Wheat Plant.

The following will give the idea:

- Hard or Flinty
  - Yellow Flint,
  - White,
  - Colored or mixed,
  - Pop corns, etc.
- Soft and Dented
  - Yellow,
  - White,
  - Colored.
  - Shriveled or Sugar Corn.

THE HARD CORNS are characterized by fewer rows of short, round grains which are very hard, more or less translucent throughout, rarely whitish or thickened at the outer extremity, which is never dented. These are commonly called Flint corns, and they are largely cultivated in the northern regions. They are usually early varieties, but when carried to lower latitudes some of them have been found to enlarge their stalks, to become really tall and at the same time to require a longer season for their maturity. Such are the White Flints that are used in the preparation of the domestic hominy of the Gulf States.

These flint corns may be grouped in subdivisions characterized by color, as *yellow*, embracing orange and rarely red; *white* and *mixed*, in which different colors are found associated upon the same cob, as in the squaw corn. In this class are to be found the small-grained varieties, known as pop corn, the grains of which expand and burst when roasted. These are often furnished with larger grains than others of the flinty class, and one of them, being unusually long and pointed at the end, has received the name of rice-corn; of this the plants yield both pure white and bright red grains on separate ears.

A very curious variety exists that is thought by some to be the original corn plant, in which the husks enclose each grain separately. This is only a curiosity, and is rarely cultivated.—[See the tassel illustrated elsewhere, the male flowers of which while furnishing pollen for the silk of ears underneath, also serve to fertilize the female flowers which also grow upon the same tassel, fig. 7, p. 9.—EDS.]

SOFT OR DENT CORNS embrace all that are not flinty, but their hardness varies considerably, nor are they always soft in the common acceptation of the term. All the Gourd-seed and Dent varieties belong to this class. They usually have rather long grains, that are always whitish or opaque at the end, and are either dented or roughened and pointed.

In this class we must also place the variety with short grains that are opaque throughout, but so soft as to be easily crushed by the nail.

In many of this class the body of the grain is translucent, firm and flinty, hence they are heavy, and the white varieties are largely used in the manufacture of hominy, as prepared by the machinery which has supplanted the primitive hominy block of the slave era.

Under the class of soft corns is found a group which, though essentially soft, is also very distinct from all others. These are the shriveled or sugar corns, so named from their corrugated forms and from their sweetness. They are especially devoted to the kitchen garden, and are grown for table use, almost exclusively. Under continued culture, crossing and selection, these also have resulted in numerous variations as to size and color, as well as in their time of ripening.

The peculiar character of the inflorescence of the *Zea mays* renders it one of the most plastic and easily crossed of all our grasses, and there would seem to be no end to the variations that might be produced, and yet it is remarkable that many of our established varieties so reproduce themselves with great constancy. W.

HISTORY OF CORN FROM 1492 TO 1881.

A Truly Scientific Paper.

S. RUFUS MASON, X. Y. Z.; O. K.

WHEN Columbus discovered America he also discovered corn, to his great and lasting amazement. All efforts to learn its origin failed, but as it existed everywhere, he concluded it came from Nature's great cornucopia, which he translated Copious corn crops.

Cornplanter, a descendant of the Digger Indians, and progenitor of the Cornish Miner now settled around Cornhill, England, while upon a still hunt one moonshiny night, in company with some Yengeese, discovered corn-juice, and imbibing too freely, caused a rise in spirits. Great excitement ensued; everybody went into corn-juice, and *vice versa*.

The mode of cultivating corn was, in the time of Columbus and Cornplanter, well known and understood, and was as follows: The natives got seed *ad libitum*, planted it in hills *quantum sufficit*, hoed it *cum spiritum non stoperandum*, husked it *nil desperandum*, hauled it to the Yengeese still, and put the juice under their jackets *con amore*. There has been an improvement in this process, but success depends entirely upon circumstances, some of which are mental, some physical, some atmospherical, and some metaphysical, the last only when all the others are *conjunctis unnaturabilis ad hominum*.

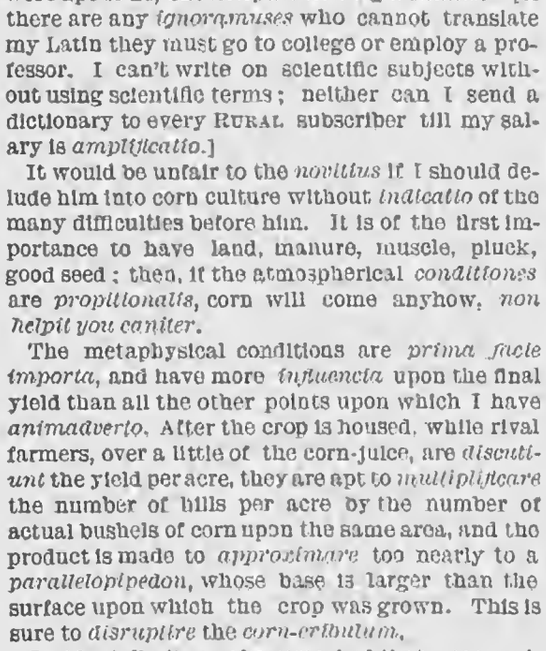
As Cornplanter was the first who investigated the subject scientifically, the machine with which corn is planted is called after him *in memora*.

While returning from the still the old chief was always in a roaring good humor, even if the Yengeese cheated him out of half his grist, as they were apt to do, but *non fuit non differentialis*. [If there are any *ignoramuses* who cannot translate my Latin they must go to college or employ a professor. I can't write on scientific subjects without using scientific terms; neither can I send a dictionary to every RURAL subscriber till my salary is *amplificatio*.]

It would be unfair to the *novitius* if I should delude him into corn culture without *indicatio* of the many difficulties before him. It is of the first importance to have land, manure, muscle, pluck, good seed; then, if the atmospherical *conditiones* are *propitionalis*, corn will come anyhow, *non helpit you caniter*.

The metaphysical conditions are *prima facie importa*, and have more *influencia* upon the final yield than all the other points upon which I have *animadverto*. After the crop is housed, while rival farmers, over a little of the corn-juice, are *discutiunt* the yield per acre, they are apt to *multiplicare* the number of hills per acre by the number of actual bushels of corn upon the same area, and the product is made to *approximare* too nearly to a *parallelopipedon*, whose base is larger than the surface upon which the crop was grown. This is sure to *disruptire* the *corn-cribulum*.

Incidentally it may be remarked that a too copious *imbibitiore* of *cornus spiritus* will *inevitabulum production serpentarium* in *bootes*. "I pray you avoid it," or you'll get shakes. In this year of cornucopia we have a great crop; all our knowledge has been put into the ground, and now our yield is in exact *proportionability* to our outlay. So it has always been and always will be. Live and learn.



JERSEY BULL, DIAVOLO.

THIS bull was the first prize in the yearling class at N. Y. State Fair in 1880. It is the property of Hon. Erastus Corning, of Albany.

The engraving, Page 9, from a photograph taken for the RURAL NEW YORKER, at the time of the fair, and reproduced by our own artist with great faithfulness, is a very correct portrait of this spirited and beautiful animal. That he is "good enough" goes without saying, for he won the highest honor in a large class. The photograph, as usual, slightly exaggerates the legs, perhaps, but the lifelike play of light on the hide, the shadows, the spirited pose of the animal are excellent, and so well preserved that the picture is a source of pleasure simply as a work of art. Diavolo was sired by Stockwell 3d, the noble bull which won the first at the same show in "aged" class, and was imported by Mr. Corning. His dam, Tranquility, is by the same sire, her dam being Daisy Morton, also imported.

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

CONCERNING THE DISCIPLINE OF CARELESS PEOPLE.

MARY WAGER-FISHER.

I KNOW a woman of very large wealth who trained her children to careful habits with a strictness not all the mothers in the country are capable of, but which, if they were capable of, there would be fewer careless people in the world to vex and annoy the careful ones. Her method was to pick up every article left by a child out of its proper place, and put it in a box or bag for two weeks; it might be a "Sunday" hat, shoes, cloak, stockings—no matter what it was, it went forthwith into the secret receptacle and remained there until the expiration of the fortnight. At that time the children were assembled, the bag produced, one by one the articles were taken out, held up, and the owners called to claim them. Of course it often happened that the punishment was very severe, as when a child was obliged to remain at home for lack of some article to wear; but the result was delightful—each child soon became accustomed to take care of his own things, put and keep them in proper place, and always know where to find every article he wanted. And that is precisely what every child should be trained to, and any mother who does less than to train her children, especially her boys, to orderly habits, fails in her duty; and I am free to confess that a very great many fail herein.

I have had, within the past year or two, a great deal of experience with a boy nearly out of his teens, who was born with the "bump" of carefulness left entirely out of his composition. From his infancy up he had been talked to and scolded at continually for this woful fault, but never *trained* to take care of anything. He would leave his best coat, hat or boots out in an all day's rain, and wherever he found it convenient to lay down any article whatever—clothing, books, horse-harness or what not—there it remained until some other person chanced to come across it. A more incorrigible and hopeless case it would be impossible to imagine. I am explicit on this point so as to assure every reader who has such a "pest" in her family that the case *is* curable. To begin with, I gave orders to all the domestics about the house never to pick up or put away an article of his clothing. When the sitting-room devoted to the "help" became fairly obstructed by this youngster's belongings I would call him in, and, pointing around to each article, ask him if he knew to whom that belonged, and by the time he left the room he would be loaded to the top of his head with dry goods, and very often with wet goods—garments that had been soaked in the rain and thrown down in a wad in some corner. I continued in this manner for several months, but without any perceptible change in the boy's habits. Finally I hung a bag in the room, and without any comments I put into this bag whatever article I found in the room that belonged to him. Boots and coats and trousers that were too large to put in the bag I stuffed away in the most obscure corner of a dark closet that opened out of the room. I laugh now when I think of the perplexity that young man has endured in search of his wearing apparel, and I am not at all sure that he has yet made the discovery of the bag in the room, as, in common with all careless people, he has eyes but he sees not. But the bag, and the putting-out-of-sight of his possessions, wrought better results within one week's time than all the talking and scolding had accomplished in fifteen years. To succeed in a reform of this sort requires stolidity of feeling. As to the *boy's* feelings in the matter, the more he can be made to suffer from his carelessness the better, for any suffering that he can be made to undergo, short of destroying his health or killing him, will be of but small account if he is cured of his fault by the ordeal; for I hold that an utterly careless and thoughtless person, in whom no trust can be imposed with security, is an absolute nuisance, and has no claim upon society for a place in it, except the irresponsible one that he is in the world and must stay somewhere until the world is happily rid of him.

Very many persons act upon the theory that because a boy *is* a boy he must therefore be inordinately careless, and have mother or sisters trotting after him in order to keep him and his belongings in shape. If there is anybody able to wait upon himself, to keep his room in order, his drawers of clothing in a proper state, to sew on his loose buttons, and to darn his stockings, it is the healthy, romping, all-alive boy of the family, and to expect anybody else to do these things for him is altogether a mistake. I know of no reason why the tired mother should never have an evening for rest or reading, because of the never-ending darning and mending and odds and ends of work for husband and boys who spend their evenings in eating apples, in whittling a stick by the fire, or in some other equally profitless way. To the thorough-going housekeeper there is never an end of the work, but there is nothing that so lightens the load and facilitates the easy and agreeable motion of the household machinery as for each member of it to wait upon himself and to do his own "picking up." It is only a trifle for each one to do these small things for himself, but when aggregated and put upon the mother or sister, who has plenty of other tasks, it becomes a burden that is as cruel as it is unnecessary. And if any or all mankind leave these things for some woman to do, it is the fault of womankind. The most important member of the family is the wife and mother, and if she wears herself out in doing for the members of her family what they can and should do for themselves, her love for them is of very small compass. The man who always left his boots and his soiled linen in the middle of the floor, because his wife "liked to pick up after him," is by no means an uncommon person. He is closely related to the man who depends upon his wife or daughter to lay out his clean linen for him and to brush his clothing. If he brushes it himself, he always does it in the house, because, as his wife has to "dust things anyway," she might as well have "more dust" while she is about it. I think it is a misfortune for an energetic person to know "everything," but I do think it is a very important thing that all boys should be taught how to use the needle sufficiently well to sew on buttons, to fix their torn buttonholes neatly, to sew up a rent in the coat, or a rip in the trousers. There comes a time in the life of every man when he would be saved much vexation and annoyance by knowing how to do these things, instead of standing in despair and humiliation before his looking-glass, unmanned and unnerved by the sight of a rent or a lost button. Needles, thread, thimble and scissors should be in every boy's bedroom; the use of them will go a little way, at least, in teaching him observation, carefulness and self-reliance. The sooner a child learns that in order to be best waited upon he must wait upon himself, the better. For boys and girls of all ages there is no equipment better for them in life than the formation of careful habits, and the ability to think, act and do for themselves, and to carry the resources of their own happiness within themselves.

DOMESTIC RECIPES.

Steamed Corn Bread.

Two cups of white Indian meal, one cup of sifted flour, two and a half cups of buttermilk, a tablespoonful of melted butter, two tablespoonfuls of sugar, a teaspoonful of soda and a teaspoonful of salt. Beat thoroughly, put into a buttered mold or tin pail and steam one hour and a half, then set in the oven ten minutes. Turn out and eat while warm. This makes an excellent dessert eaten with liquid sauce. By adding a cupful of dried cherries or currants it is much better for a pudding.

Corn Gems.

One scant pint of meal, two tablespoonfuls of sugar, a teaspoonful of salt and a generous pint of *boiling* milk. Stir thoroughly and let stand until cool, then stir in three beaten eggs and bake in buttered gem pans.

Indian Crumpets.

Bring one quart of milk to the boiling point and pour over a quart of fine meal, mix, and let stand until lukewarm, then stir in two tablespoonfuls of sugar, two of melted lard and butter mixed or of either alone, and a teaspoonful of salt, half a teacupful of home-made, soft yeast. Let rise five or six hours, then put into greased muffin-rings, set before the fire for 20 minutes and bake 35 minutes in a rather quick oven. MARY B.

Corn Mush.

When the water intended for mush begins to boil, salt, sift in the meal with one hand, stirring with the other to prevent lumps. When thick, set the kettle into the oven and let it bake an hour. This cooks the meal thoroughly without danger of burning.

Fried Mush.

The addition of flour—a teacupful to two quarts of meal—to mush intended for frying makes it very nice. Fry in beef-drippings, not lard and if the slices of mush are first dipped in beaten egg and then in cracker crumbs before frying, they are very much better.

Corn-meal Fritters.

Two cups of white meal, three cups of sweet milk, one-half cup of flour, four eggs, beaten separately, a tablespoonful of melted butter, a teaspoonful of salt, two teaspoonfuls of baking powder. Beat the yelk, to them add the milk, butter, salt and meal, beat hard, add next the whipped whites, and last the flour and baking powder. Drop at once into boiling lard. Eat with a hard or liquid sauce. The batter should be just thick enough to drop readily from the spoon. Make the fritters of small size. MRS. BRADY.

Hominy Croquettes.

Boil two cups of fine-grained hominy. When quite cold work in two beaten eggs, two tablespoonfuls of melted butter, salt and pepper to taste. With floured hands make into oblong rolls and fry to a light brown in hot lard.

Hominy Muffins.

Two and a half cups of soft-boiled hominy, one quart of sweet milk, three eggs beaten well, a large tablespoonful of melted butter, a tablespoonful of sugar, a little salt and a large cupful of flour with two teaspoonfuls of baking-powder sifted with it. Mix well before adding flour, beat the flour quickly and bake in hot muffin-rings. H. L. 1.

Corn-meal Pudding.

Two cups of Indian meal, one cup of flour, three cups of sour milk, two tablespoonfuls of sugar, a tablespoonful of melted butter, a little salt, any spice you please, and a large teaspoonful of soda dissolved in hot water. Beat the ingredients free from lumps, adding the soda last. Pour into a buttered mold or tin pail and boil two hours without stopping. Eat with liquid sauce or maple sirup.

Corn-meal Pudding No. 2.

One scant quart of meal, one quart of new milk, three well-beaten eggs, two tablespoonfuls of molasses, a teaspoonful of salt, any spice you please, and one-fourth pound of beef suet minced very fine. Bring the milk to a boil and pour over the meal and suet. When cool add the sugar and yelks, and last the whipped whites. Dip your pudding bag into hot water, flour it and pour in the mixture. The bag should be but half filled as it swells very much. Boil five or six hours. Eat with butter, sugar and nutmeg.

MRS. E. SARGENT.

Miscellaneous.

ST. JACOBS OIL
TRADE MARK.

THE GREAT GERMAN REMEDY.
FOR
RHEUMATISM,
Neuralgia, Sciatica, Lumbago,
Backache, Soreness of the Chest, Gout, Quinsy, Sore Throat, Swellings and Sprains, Burns and Scalds, General Bodily Pains,
Tooth, Ear and Headache, Frosted Feet and Ears, and all other Pains and Aches.

No Preparation on earth equals ST. JACOBS OIL as a *safe, sure, simple* and *cheap* External Remedy. A trial entails but the comparatively trifling outlay of **50 Cents**, and every one suffering with pain can have cheap and positive proof of its claims.

Specimen copies of any of the journals here announced as clubbing with the RURAL NEW-YORKER *will be sent without charge to all who apply. The application, however, must be made to the journal of which specimen copies are desired. Send for them!*

News of the Week.

HOME NEWS.

MONDAY, Dec. 27, 1880.

A dispatch from London announces the fact that Mrs. Cross (George Eliot,) the distinguished novelist, died at 10 o'clock, Wednesday night. Her death was quiet, and almost painless. Mrs. Cross was seized with a sudden chill, which attacked her in the larynx on Sunday last. She had, a short time before that attack, received several friends, who left her apparently in good health and spirits. The attack, however, did not give serious cause for alarm until 6 o'clock Wednesday evening. Dr. Andrew Clark then discovered that the pericardium was seriously affected, and pronounced the case almost hopeless. She passed away quietly. On the 6th of May last the deceased was married as Miss Marian Evans to John Walter Cross, of Weybridge, Surrey, a merchant in London.....Harry L. Hill, chief of the scouts of the Oklahoma Colony, and Col. Thomas D. Craddock, General Manager, who went into the Territory on December 8, having flanked the military at Arkansas City, came into camp on the 23d. They were gone fourteen days, and scouted up the north fork of the Canadian and over to the south fork. They say the territory is full of people. They met at appointed rendezvous over fifty wagons, concealed from scouts, and waiting for Capt. Payne, who would have joined them as soon as he reached the town site. They report that hundreds of claims have been taken and the foundations for houses are being built on them. Most of the emigrants they met were from Texas, Arkansas, and the Chickasaw Nation. Most of the colonists have gone to their homes to spend Christmas, only about 100 remaining in camp. Six inches of snow fell last night.....The Pacific Flouring Mill, of Rehler Brothers, at Third and Cedar streets, St. Louis, was almost completely destroyed by fire on the 23d. About 500 barrels of flour, 10,000 bushels of wheat, and about $15,000 worth of new machinery waiting to be set up (which was also in the mill) were either destroyed or badly damaged.....

Congress stands adjourned until January 5.... The United states Supreme Court adjourned until January 3....Jesse James, the notorious outlaw, is said to be robbing Texas stage coaches.... Diphtheria and small pox are increasing at Chicago to an alarming extent... J. Nathass, an insurance and steamboat agent at London, Ont., has absconded with heavy liabilities....The Marshall House, at Ludington, Mich., was burned on the 22d. The loss is $6000; insurance, $2700.. .The Governor of Vermont has signed the "nuisance" bill, which is very stringent against liquor dealers. ....A fire in Ramberg, S. C., on the 20th destroyed property and stocks of stores valued at $12,000.

Charles L. Wilson and Edwin W. Hall were arrested at Cincinnati in the act of manufacturing counterfeit silver coins. A lot of moulds and other material were captured.... The big flouring mill of Alexander Mair, at Lapeer, Mich., was on the 22d destroyed by fire. The loss is $25,000; insured for $10,000 in the Millers' Association, and $5000 in the North American ...A jury of two colored and ten white men has been empanelled at Jefferson, Texas, to try Abe Rothschild for murder....William J. Holmes, the Chicago religious publisher, died from a carbuncle on the neck. He was 56 years old....The first trial of the electric light as a means of illuminating the Hoosac tunnel was made yesterday, with success. ....A fire at Auburn, Me., destroyed four houses occupied by eleven families, causing a total loss of $6000; insured for $3000.

The 71st anniversary of the New England Society of New York City was held on the evening of the 22d, in Metropolitan Concert Hall. As the guests entered the hall they were conducted to a reception room, where they were introduced to General Grant, General Sherman, Levi P. Morton and others... ....Judge Blodgett, at Chicago, passed sentence on John G. Wustun, Orin C. Whitney and Charles H. Perkins, guilty of defrauding the Government in the celebrated match bond cases. Each received one year with hard labor in the Chester Penitentiary.....According to custom, the Executive Departments of the Government will only be open for business from 9 A. M. to 12 M. during holiday week. .....Professor Gamgee gave an exhibition at the Washington Navy Yard of his newly-invented ice machine, the novelty of which consists in the utilizing of heat, which other machines waste, and the liquefaction of ammonia by expansion. The test was very satisfactory..... The Senate in executive session voted down the motion to reconsider the confirmation of Judge William B. Woods as Associate Justice of the Supreme Court, and his confirmation thererore stands. The Senate also confirmed the nomination of Theo. S. Singiser, of Pennsylvania, to be Secretary of Idaho Territory.....The Senate took up the resolution offered by Mr. Morgan in June last declaring that the President of the Senate is not constitutionally authorized to count Electoral votes so as to determine what votes shall be received and counted or what rejected. Mr. Morgan spoke at length in favor of the resolution, and was followed by Mr. Edmunds in opposition, when the resolution was laid aside.

[Chicago Journal.]

A Chicago Broker's Happy Investment.

Lewis H. O'Connor, Esq., whose office is located at 93 Washington street, this city, lately related the following in the hearing of one of our reporters as an evidence of special good fortune. I have been suffering, said Mr. O'Connor, for a number of weeks with a very severe pain in my back, believed to be from the effects of a cold contracted while on the lakes. I had been prescribed for by several of our physicians and used various remedies. Three days ago I abandoned them all and bought a bottle of St. Jacobs Oil, applied it at night before retiring, and to-day feel like a new man. I experienced almost instant relief, and now feel no pain whatever.

AGRICULTURAL NEWS.

SORGHUM SUGAR MAKING.—The Second annual meeting of the Illinois State Cane-Growers' and Sugar-Makers' Association was held in the rooms of the Department of Agriculture at Springfield, Ill., and was called to order by Dr. Newberry, Secretary. In the absence of the President, Maj. McDowell, of Chicago, proprietor of the South Elgin Sugar Works, was called to the chair, and the following committees appointed to prepare business for the action of the Association; on Order of Business, Dr. Newberry, Maj. McDowell, H. J. Emery; on Resolutions, M. D. Scoville, Jonathan Perriam, and O. C. Gibbs. A fine display of sugars and sirups was on exhibition, there being a notable increase in the number of samples of dry sugars in comparison with sirups over any previous exhibition, showing that a substantial advance had been made in the last year. Maj. McDowell, from the Committee on the Order of Business, reported the following topics for discussion: First, "Season of Planting"; second, "Preparation of Ground"; third, "Seed Varieties, and Where From"; fourth, "Planting Hills or Drills, Quantity of Seed to the Acre"; fifth, "Cultivation"; sixth, "Harvesting, When; Condition of the Seed Strip or Top"; "Would You Harvest, as Wanted to Work Up and Cut and Pile Up, and in What Manner?" eight, "What is the Treatment of the Juice?" ninth, "What Process of Manufacture: Open Pan or Vacuum, Fire or Steam"; tenth, "How Much Average Product of Cane to the Acre"; eleventh, "How Many Gallons of Sirup to the Ton"; the twelfth, "How Much Sugar Per Gallon of Sirup"; thirteenth, "Cost of Production Per Acre of Cane"; fourteenth, "Cost Per Gallon of Sirup." The following is a summary of conclusions arrived at by the testimony:

First—Season of planting: as soon as the ground is warm enough to insure a quick germination of the seed.

Second—Preparation of the ground; should be thoroughly pulverized and a fine seed-bed formed.

Third—Varieties of seed; for northern localities like Minnesota, Wisconsin and Northern Iowa the early amber; in more southern localities early amber for the earliest working, and the early orange, which ripens from three to four weeks later, for the latter working, thus extending the length of the working season.

Fourth—Method of planting; both hills and drills were advocated with a general expression in favor of drilling very thick in the row, using not less than three pounds of seed to the acre.

Fifth—Cultivation; about the same as corn, except that it requires more care to keep clean when small.

Sixth—Time for harvesting; experience and analysis of the juices show that it is richest in cane-sugar when the seed is hardening from the dough state.

Seventh—Should it be cut only as wanted to grind or cut and piled up? Testimony conflicting; those from Minnesota say there is no deterioration when kept for weeks after cutting, if not frozen. In this State the general testimony is that it deteriorates in cane-sugar, which changes to grape-sugar if kept, after being cut, for any length of time.

Eighth—Treatment of juice; all agree that the acid of the cane should be neutralized by using milk of lime in the juice heated from 180 to 200 degrees, and the defecied juice then reduced to sirup as rapidly as possible. If the boiling is slow and long-continued, the cane-sugar inverts or changes to grape-sugar.

Ninth—Process of manufacturing. Should the evaporation be by fire or steam; equally good results are obtained by either method, rapid evaporation alone being essential.

Tenth—What amount of cane can be produced per acre This varies with the season, condition of the soil, and method of cultivation, but will vary from ten to fifteen tons

Eleventh—How many gallons of syrup can be produced per acre? This varies greatly, reports running all the way from 60 to 200 gallons. With good soil and cultivation an average of 150 gallons per acre can be relied upon.

Twelfth—What is the cost of producing cane per acre in comparison with corn, the cane to be delivered at the mill ready for grinding, and corn harvested, shelled and hauled an equal distance to market? About the same; perhaps a little more for the cane.

Thirteenth—Number of pounds of sugar from each gallon of sirup; three to nine pounds. Of this more hereafter.

Fourteenth—Cost of making syrup per gallon; 12½ to 19 cents, according to kind and capacity of works.

Fifteenth—Value of seed; all agree that it is valuable for feed for stock. Many claim that it is equal to its weight in corn. An analysis which was given, however, showed that it is not the equal of corn. Most, however, show that it will pay for the labor of planting and cultivating the crop.

Sixteenth—Length of manufacturing season; with the early orange to follow the early amber; the season can be extended from sixty to ninety days.

DEATH OF PROF. MECHI.—A despatch from London, as we go to press, announces the death of Prof. J. J. Mechi, the celebrated English agriculturist.

[Cleveland Penny Press.]

See the Conquering Hero, etc.

Among the most wonderful articles of the period is St. Jacobs Oil. The Hon. Leonard Sweet, of Chicago, pronounces it the most thorough conqueror of pain that he has ever known.

[This being our Special Corn Number, our usual departments devoted to Literary Miscellany, to Women, &c., &c., are either excluded or abridged.]

Dr. Pierce's Golden Medical Discovery cures every kind of humor, from the worst scrofula to the common pimple or eruption.

Four to six bottles cure salt-rheum or tetter.

One to five bottles cure the worst kind of pimples on the face.

Two to four bottles clear the system of boils, carbuncles and sores.

Four to six bottles cure the worst kind of erysipelas.

Three to six bottles cure blotches among the hair.

Six to ten bottles cure running at the ears.

Five to eight bottles cure corrupt or running ulcers.

Eight to twelve bottles cure the worst scrofula.

Sold by druggists, and in half-dozen and dozen lots at great discount.

Druggists say that LYDIA E. PINKHAM'S VEGETABLE COMPOUND is the best remedy for female weakness that they ever heard of, for it gives universal satisfaction. Send to Mrs Lydia E. Pinkham, 233 Western Avenue, Lynn, Mass., for pamphlets.

Tropic Fruit Laxative, an agreeable substitute for pills and nauseous purgatives. One lozenge is the dose. Physicians prescribe it. Sold by druggists.

Millions of bottles of BURNETT'S COCOAINE have been sold during the last twenty years, in every civilized country, and the public have rendered the verdict that it is the cheapest and best Hair Dressing in the world.

The Markets.

PRODUCE AND PROVISIONS.

NEW YORK, Friday, Dec. 24, 1880.

BEANS AND PEAS.—The demand for beans is light and prices for mediums and marrows show a weakness under the very heavy receipts. Sellers, however, do not apprehend a serious decline, as they look for a lull in the demand at this season. Green peas quiet but somewhat steadier at $1.70@1.75. Southern B. E. peas firm at $2 ₱ 2-bush. bag.

Marrow beans prime $1.87½, do. other $1.75@1.80, medium prime $1.70@1.75, do other $1.60@1.65, pea $1.60@1.80, white kidney $1.85@2.05, red do. choice $1.70@1.75, do. other $1.55@1.65, black or turtle soup $1.60@1.65, lima $4.50@5.

BUTTER.—The week has been attended with liberal arrivals of high grade State butter, and buyers have soon discovered the favorable point thus given them. Best buyers are holding off and the market is easier as our price-list indicates. The high prices of December have prevented the accustomed activity of that winter month, especially as the demand has been so locally confined. Dealers look for an early start in trade after the holidays are over as both quality and quotations will be on buyer's side. Sellers of western began to shade figures early in the week and there is yet room for further marking off before an enlarged call is drawn away from fair priced table grades of State. The chief weakness of the moment is in creamery.

Creamery, Western choice 34c. fair to prime, 29@32c; State poor to best 22@33c.; sweet cream 25@31c.; State dairies, entire choice, 22c.; fair to prime, 22@24c.; firkins, 19@24c.; pails and h'f tubs, choice 28@29c.; fair to prime, 24@27c.; poor, 18@20c.; Welsh tubs, fresh 25@27c; other 18@23c.; Western imitation creamery, 24@28c.; dairy, choice, 24@26c.; fair to prime, 20@24c; poor 16@18c.; factory, late made 20@21c.; common to prime 13@19c.; rolls choice, 21c.; other, 19@20c.

Receipts for the week, 18,914 pkgs.

CHEESE.—A very fair business has been done this week on export account and the market closed strong. Medium grades have been most freely taken, or stock to be had at 10@12½c. Fancy grades are offered reservedly, and the best at 13¼, with here and there 13½ asked. Quotations are for

State factory, fancy, at 13@13½c.; do. good and prime, 12½@12¾c.; do. fair to good, at 11½@12½c.; do. h'f skimmed, 8½@10c.; Wisconsin factory, fine, 12½@12¾c; do. good to prime, 11¾@12¼c.; do. fair to good, 10¾@11¾c.; Ohio factory, fine, 12¾@12¾c.; do. good to prime, 11¾@12¼c.; do. flat, fair to good, 10@11¾c; do. poor to fair, 7@10c.

Receipts for week, 40 677 boxes.

Liverpool cable price, 63s.

Steam for dairy products to Gt. Britain, 35@45s.

COTTON—The market has shown little life the past week, and the changes in prices have not been very material. Latest prices are for

December at 11 80@11.82c.; January at 11.88@11.89c.; February at 12.06@12.07c.; March at 12.23@12.24c.; April at 12.36@12.37c.; May at 12.49@12.50c.; June at 12.60@12.61c.; July at 12.59@12.71c.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted.

Strict good ordinary	9¾	Middling	11¼

Receipts for the week, 32,766 bales. Exports do. 9 475 do.

DRIED FRUITS.—Apples have had little attention the past week, and in fact the whole market shows the lull incident to the holidays. Quotations are for

Evaporated apples at 8¾@8¾c. for the better qualities; sliced apples at 5@5¼c. for good to choice North Carolina; 3¾@4¼c. for Va. apples, 4@4¼c. for Tenn. do; 4¼@5¼c. for State do; 3¾@5¼c. for western Ohio and Mich. Peaches at 30@32c. for evaporated peeled; 10c. for unpeeled do.; N. C. peeled at 20@21c.; for the better qualities, unpeeled peaches at 6¾@7¼c. for halves and 6¼@7c. for quarters. Plums at 15@16c. Blackberries at 8c. Cherries at 18c. Raspberries at 25c. Whortleberries at 12@12½c.

Receipts for the week, all kinds, 1,947 pkgs.

Exports for the week, dried apples, 7,734 pkgs.

EGGS.—Receipts for the week, 13,649 bbls.; do last week, 15,179 do. Daily supplies light. The demand is good but chiefly directed to good stored and limed, owing to the high prices for fresh.

Near points 34@35 State and Pa. 31, Western fresh 31, Southern 31, seconds 25@28, limed State 24, do. Canadian 23@24, Western 25@28½.

FLOUR. Supplies have steadily accumulated and the market has had a downward turn and closed weak. Exporters have taken fair quantities at the yielding prices.

Latest prices are: $3.10@3.85 for very inferior to strictly fancy superfine State and Western; $4.00@4 40 for poor to choice extra State and Western, odd lots and lines; $4 10@4 65 for choice to fancy do.; Inferior to good white wheat, trade and family extras, $4 25@5.10; good to choice do, at $5.10@5.85; (very choice up to $6 25;) red and amber wheat inferior to choice trade and family, at $4.25@5.85; round hoop Ohio $4.25@4 75; and trade and family brands of do at $4.80@6.25, the latter for very fancy: St. Louis at $4.40@5.25 for inferior to good extra; $5.25, for good to choice, Minnesota clear, inferior to very choice at $4.35@6.00; Minnesota "straight," poor to fancy, at $5.25@7.00, and patent inferior to fancy at $5.75@8.00; city mill extra at $5.25@5.50 for ordinary to very choice for the West Indies; do. for England, $4.20@4.90 for poor to very choice spring wheat, and $4.75@5.50 for winterwheat product; do. trade and family extras, $5.65@7; do. for South America, $5.50@6.00; the latter for fancy; No. 2 at $2 85@3.50 for inferior to fancy.

Receipts for week, flour, bbls. 148 400; corn meal, do. 2,000; wheat, bush. 672,850; corn, do. 297,250; oats do. 165,350; rye, do. 14,875; malt, do. 28 274; barley, do. 88,500. beans, do., 12,208; rice, pkgs. 2,175.

Exports for week, flour, bbls. 113,000; corn meal, do. 1,035; wheat, bush 863,500; corn, do, 255,900; oats, do. 270; peas, do. 3,100; beans, pkgs. 180; rice, 364.

CORN MEAL.—Sales at $2.60@3.15 for yellow Western and $3.50 for Brandywine.

FRESH FRUITS.—Christmas-time always increases the demand in every line of fruit and nuts and with the activity of the past week sellers have no reason to complain this year. The fine quality of apples is a marked feature which will tend to keep trade steady. It is not usual to see lady apples at the cheap rates of the present Most of the demand for apples is from safely-housed storings. Railroad lots as before are irregular, as many are sold conditionally. We quote prime Baldwins ₱ bbl. $1.87@2; Greenings, $1.75 Sulzenbergs, $2@2.25 Northern Spy $1.50@1.75; Lady apples, selected; $7@8; other, $3@6; Half bbls. sell quickest. Cranberries have a good but not large local movement; Capes are firm and high; N. J. have a promised abundance and only prime hard fruit shows firmness. Cape Cod fancy bbls. $7.50@8; other $4@7, N. J., boxes fancy $2.12@2.25, other $1.50@2. Florida oranges are in large supply and dull for the bulk of stock; most of the arrivals to be repacked. Choice half bbl. boxes, $3.25@3.50; ordinary $2.00@3. Boston pears, $4@6 per box. Catawba grapes 4@6c. ₱ Peanuts are in fair demand; at this season trade in nuts is divided among foreign. Va. hand-picked peanuts 4½@5, other, 3½@4¼, shelled 4@4½, Hickorynuts ₱ bush. of 50 ₱s. $1.62@1.87. Bull nuts 60@75. Black walnuts 40@50c. Pecans 9¼@9½c.

FEED.—Sales at $16@17.50 for 40 to 60 ₱s., $16.25@17.25 for 80 ₱s, $17@18.50 for 100 ₱s.

GRAIN.—Wheat has been steadily declining on the increasing supplies and moderate export trade. Latest sales are of

No. 1 white at $1.13¼@1.14, do. December at $1.13¼@1.13¾, do. January at $1.13¾@1.14, do. February at $1.16¼@1.16½, do. steamer at $1.11@1.12¾, No. 2 white at $1.11¾@1.12, ungraded white at $1.08@1.13, No. 2 red at $1.15@1.16¼, do. December at $1.16¼@1.16¾, do January option at $1.15¼@1.17¼, do. February a.

$1.19@1.20¼, do. March at $1.21@1.21½, do. May at $1.31¾@1.31¾. No. 3 red in lots at $1.12@1.14, ungraded red at $1.07@1.20, No 2 Chicago at $1.15, rejected Spring at 9?@$1, ungraded Spring at $1@1.11,

Rye quoted at 97@99.

Corn is at easier prices and demand moderately active: lowest prices are for

New York No. 2 at 57½, do. January at 57@57¼, do. February at 57¾@57¾, do. March at 57¾, do May at 56¾@56¾, ungraded mixed Western at 54@57¼, No. 3 at 54½ New York steamer mixed at 55@55¼, N.Y yellow at 57¼ for old, and yellow Jersey at 55¼.

Oats have been fairly active closing with sales of Extra white at 43, No 1 white 45@46½, New York No. 2 white at 44@44½, No. 3 white at 41¾@42, New York No. 1 at 42¾@43, New York No. 2 at 42¼, do January at 42@42½, do. February at 43½@43¾, do. March at 41¾, No. 3 at 41¾, ungraded white Western at 42@46, ungraded mixed Western at 41@43, No. 2 Chicago quoted at 42½.

HAY AND STRAW.—The arrivals by rail have been liberal and prices have eased off a little. Quotations are for

Selected retail State hay $1.20@1.30 per 100 lbs; other grades of timothy at $1.15@1.20 do, grades for railway and shipping wants at $1.05@1.10, clover mixed at $1.00@1.05, clover clear at 95c.@$1, salt hay at 65@70c. Straw—long rye; $1.10@1.20, short rye, oat, wheat and barley 85@90.

Exports for the week 500 bales.

HOPS.—The market has had a dull look this week without, however, marked change in prices the impression being that with the close of the holidays more animation will result.

	Cents per lb.
New Yorks, crop 1880, prime and choice	22 @23
Do. medium	19 @20
New Yorks, crop 1880, low to fair	16 @18
Eastern, crop 1880	18 @22
Wisconsin, crop 1880	18 @22
Yearlings, crop 1879, choice	14 @20
Olds, all growths	4 @12
Bavarians	30 @35
Bohemians	35 @40
Pacific coast, new	20 @24

HONEY.—Supplies are large in first hands and the demand is not sharp enough to vary late figures.

White clover, comb, single, 17@18c.; larger pkgs. do. 15@16c.; buckwheat 12@13c.; extracted 7@11c. as to color.

LEATHER.—Quotations for hemlock sole are 22½@24 for light 23½@25 for middle, 25½@25 for heavy and 21½@22½ for good damaged.

POULTRY AND GAME.—When it is remembered that Christmas week has traditions in the matter of roast beef and fat geese, that hardly permit turkeys to hold a special trade, the market this week for the latter may be regarded as the best noted for several years for the period Sales have been very steady, and the upper prices have been readily made for prime dry picked and carefully scalded, from any section. Chickens and fowls are slow and easy in price. Ducks active for prime. Geese seem to have recovered their old time demand and prices are good for the quality offering. Weather fine for poultry, and any surplus that may be left will carry over well.

Turkeys, N. J. choice, 13@13½, State do. 12@13; good to prime 11@12, Western, choice, 12@12½, good to prime 10½@11½, fair to good 9@10, Phila. dry'd, 12@14. Chickens do. 12@13, Ducks Co. 10@12; N. J. 10@11c.; State scalded, 8@11c.; Western, do., 8@9c.; common 6@7. Fowls, Phila, dry-picked, 10 N. J., 9@10, scalded, do, 8@9; State and Western prime, 7@8; poor to fair 6@7. Ducks, choice 11@13; other 8@10, Geese, choice 13½@14½; other, 8@10. Squabs, light $2@2.25 dark, $1.25. Live poultry has advanced with a demand from Jews. Supply higher. Chickens and fowls, 8@10; roosters, 4@5, turkeys, 10@13. Ducks, choice, 60@75, other 40@50. Geese, choice, $1.75@2.20; other 80@$1.50.

Wild ducks, canvas back $1.25@2, the latter for Havre de Grace; red heads 50@75; mallard 50@60, teal, 30@40, the latter for blue winged; common 25@30, including bread-billed; quail prime trapped per doz $1.50@1.62, poor and soft, 75@$1.25, partridges, 60@85. Grouse prime $1@1.12, drawn 80@90, Hares, 20@25, Rabbits, 15@20, Venison, Minn. saddle, 11@12, other 10@11. Whole deer, 7@8: show deer with fine antlers, 10@11.

Venison is low, as dealers press its sale owing to the close of the season, Dec. 31st. Birds are fairly firm a good demand looked for during holiday week. Quail are high, but other items favor buyers.

PROVISIONS.—Hog products have been moderately active only and prices weak.

Mess pork closed quoted at $13 25 for old in job lots, while round lots of new are for February delivery $13.30 bid and $14.20 asked. Bacon at 7.20 for long clear, and 7.50 for short clear. Beef at $19@20 for city extra India mess. $9.50 for extra mess, $8 50 for plain mess. Beef hams at $15.50@15. Lard, Western steam at 8.85 for spot lots, 8 82½ for December and January 8 92½@8.95 for February, 9 02½ for March. Stearine at 9@9¼. Tallow at 6.06¼ for prime

Receipts for week, beef, bbls. and tcs.; 800: pork, 7,026 bbls; cut meats, 47,471 pkgs.; lard, 22,701 pkgs.

Exports for week, beef, bbls, and tcs. 2,243, pork, 3 611 bbls.; cutmeats, 15,080,518 lbs.; lard, 5 980,450 lbs.

TOBACCO.—There has been a dull in trade this week and prices not showing important change.

SEED LEAF.	Crop 1879.
New England Havana seed	19 @25
Wrappers, common	13 @15

Havana seed	14 @18
Wrappers	1 @18

SEED.—Clover is strong and moderately active. Quoted 8@9¼ for Western Timothy is quiet at $2.75@2.85.

VEGETABLES.—Exports of potatoes for week, 402 bbls. Choice cable-headed potatoes are firm with only a moderate demand. Receipts are free enough to put a liberal supply of useful stock in that would sell to a wholesale buyer at inside figures. In bulk potatoes are allowed 180 lbs to the bbl. Onions are steady with some extra call for white and yellow. Cabbage firm; other truck firm when prime.

Potatoes, E. Rose Eastern double heads $2@2.25, State, $1 75@2; do. in bulk $1.75@1 87; Burbank and prolific $1.50@1.55; snowflake $1.75@2; peerless, $1 37@1.75 peachblows $2@2.25 Sweet Del. $2.50@2.75, Onions, white, $5@5.50 yellow, $3.00@3.25; red, $3 00@3 25; Chester, $3.25; carrots, $1.25@1.50; marrow squash, 40@50; Hubbard, 75c.@$1; cauliflower, $2@3.50, cabbage, @ 100, $4@5; red, do. $5@7, pumpkins, $3@5; celery, @ dozen, $1.00@1.50; turnips, white, @ bbl. 50@75, Russia 50@75.

WOOL.—The market has shown a moderate degree of activity only this week, with prices, however, held firmly.

XX Ohio, Penn., and Va. fleeces quoted at 48@49c. X, do, at 47@49c. XXX and picklock at 50@53, No. 1 at 49@50c. No. 2 45@48c.; common at 44@46c.; combing at 50@52c.

N. Y., Mich, Ind. and Wis. 43@45c. for X and XX; 48@49c. for No. 1; 41@46c. for No. 2; and 41@44c, for common.

Iowa, Vt, and Ill. at 42@44c. for X and XX; 47@49c. for No. 1; and 43@40c. for No. 2.

Mo., Ky. and Tenn. at 46@48c. for washed and 30@37c. for unwashed.

Fertilization based on Scientific and Practical Teachings!

THE MAPES COMPLETE MANURES.

For Each Crop Adapted to Different Soils.

For detailed reports of practical results on Corn, Potatoes, Vegetables, Tobacco, Fruit, Trees, Wheat, Rye, Grass crops etc., see forthcoming pamphlet; sent free on application.

CORN.—Six acres, with orchard trees, 168 bushels ears per acre. Variety, Western Dent, 400 pound of the Mapes Corn Manure per acre (cost $10 per acre.) G. Howard King, Stony Brook, Suffolk Co., New York.

CORN.—Ten acres. Variety, White Flint, (not a heavy yielder.) My corn has turned out splendidly, three and four, up to seven ears of corn on a stalk. I send you a stalk with seven ears on when cut. It is remarkable how few nubbins there are. This corn shells out over 80 bushels to the acre. When your representative told me two years ago you could raise seventy-five bushels shelled corn per acre on these "plains," I thought him too enthusiastic, but on this farm I have proved his statement to be moderate—used three bags per acre broadcast. J. G. Shepard, Hicksville, Long Island.

CORN.—For reports of crops grown during past season, on farm of RURAL NEW YORKER, at Hewlett's Long Island, see RURAL NEW YORKER, October 9th, November 13th and 20th, 1880.

POTATOES, (Burbanks or White Rose). YIELD 400 BUSHELS PER ACRE.—800 lbs. Mapes' Potato Manure per acre scattered in the rows. Grown by Robinson Gordon, Manorville, L. I., who writes, October 15th, "I send you one barrel of potatoes raised from your Potato Manure" (160 potatoes filled the barrel and weighed 180 lbs). "This is the first season I have tried it. I used four bags to the acre, and had remarkably good results from its effects. I had *four hundred bushels to the acre* of the *finest* potatoes I ever raised, remarkably smooth and good flavored, as you will see by the barrel I send you. I have raised potatoes for the last thirty years, more or less for market, but never had such good results before. I have tried three different kinds of manure this season, but yours has done the best. I shall use it in preference to any other next season."

POTATOES. E S. BROWNELL, ESSEX JUNCTION, VT., the well-known originator of "Brownell's Beauty," "Centennial," "Pride of America," and other celebrated seedlings, wrote to B. K. Bliss & Sons, New York, Sept. 27th, 1880: "I bought of you last Spring some of Mapes' Potato Manure, which *excelled* any fertilizer that I ever used in *producing smooth and large tubers*. I got *one-third more crop* than was produced alongside when it was not used. The potatoes that I send you for exhibition, Nos. 50, 51, 52, 53, 54, 55, 56, or "White Star," show the effects of Mapes' Potato Manure. I expect to use it more extensively another season." These potatoes, as well as the "Pride of America," grown with the Mapes' Potato Manure, enlisted the verdict at the several fairs as being the smoothest and finest quality potatoes offered.

POTATOES. Late Rose.) Report of W. H. WALBERT, LANARK, LEHIGH CO., PENN., Nov. 12, 1880.

	Bushels per acre.	Quality.
Yield with natural soil	75	Medium.
" " stable manure, 15 two-horse loads	140	Good.
" " " " "s Mineral Fertilizer	60	Very poor.
" " Mapes' Potato Manure, 400 lbs. per acre	190	Very good.

Soil, chocolate loam, season very dry—had hardly any rain." Mr. Walbert adds: "For potatoes the season was too awfully dry. I wonder only how your fertilizers gave so many potatoes. The year before (1879) was a good season for raising potatoes, and the yield was immense. Potatoes are my chief crop."

VALUATION OF THE MAPES COMPLETE MANURE "A" Brand, by the New Jersey State Agricultural Station—Bulletin, July 3rd, 1880, shows this manure *to be the cheapest of all the twenty-five fertilizers examined.*
The New York Times, July 21, 1880, states:
"The value of a purchased fertilizer is an unknown quantity to the purchaser, who must depend solely on the honesty and honor, or at least the skill, of the manufacturers or sellers. The analyses of fertilizers given elsewhere, and with which we have been favored by Prof. Cook, of the New Jersey Experiment Station, show the risk which appertains to the purchase of these materials. Of 25 samples examined, only 4 exceeded in intrinsic value the cost price, while many of them exceeded very considerably in cost price their intrinsic value. Of the four, a conspicuous example is No. 13 (The Mapes Complete Manure) which is made as a substitute for barn-yard manure, which shows the highest ratio of intrinsic value above the cost price. The experiment Stations are doing valuable service for farmers in thus examining fertilizers sent to them, and pointing out the actual value of these compounded manures."
Special quotations given on material for making Complete Manures from composts or any home resources suitable for farm crops a special manuring of Fruit Trees, orchards, strawberry and all small fruits. Fertilizers specially adapted for shipment to long distances West at high freight rates. Send postal for pamphlets.

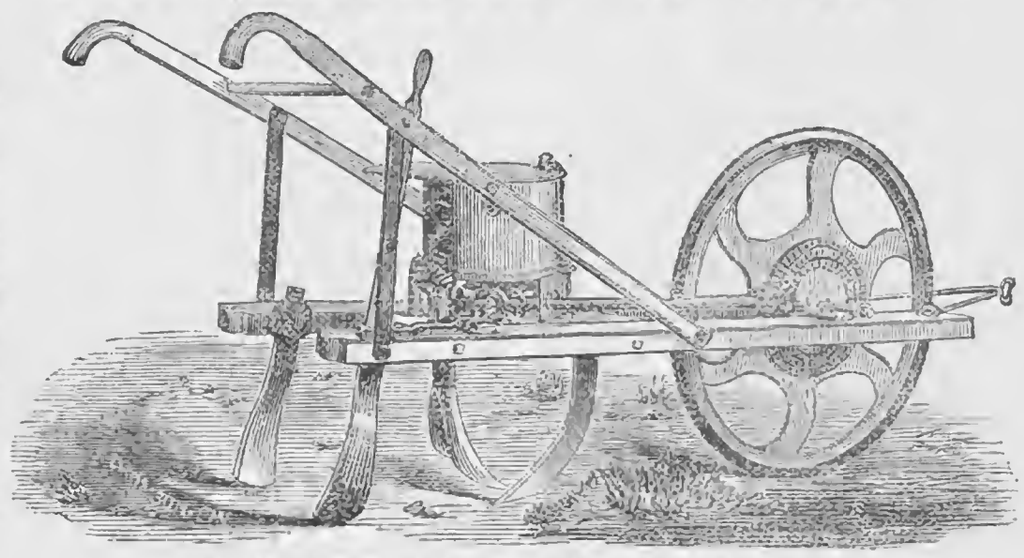
Agricultural Chemists. 158 Front St., New York.

THOUSANDS IN USE.

With or Without Fertilizer Attachment.



THE HOOSIER CORN DRILL.

Drops, with great regularity, ONE grain in a place, either 12, 15 or 20 inches apart, does the covering uniform in depth, and is both time and labor-saving. A given area of corn planted with this machine contains as many plants as when hilled, but their arrangement is such that *each* plant has access to *same* amount of plant food that must necessarily be *divided* between from 3 to 5 plants when huddled together in a hill. Hence a healthy start and vigorous growth of the plants, and the consequent production of *large* and *well matured* ears, by which the quality is improved and the yield increased from 10 to 20 bushels per acre over hill planting, are natural results following the use of our CORN DRILL.
We also make the best fertilizer wheat drill in existence. Send for circulars.

Literary Miscellany.

A TALK WITH THE OLD YEAR.

MRS. T. H. GRIFFITH.

I SAT alone in my room one night,
Sat and gazed at the dim firelight,
As it danced in shadows, fantastic and tall,
Over the floor, and ceiling, and wall.
'Twas a wild, dark night, and the snow and sleet
Wrapped the world in a winding-sheet;
While the wind in desperate fury blew,
And piled up the snow in drifts anew,
While as I sat by the fire and thought
Of the changes the year for me had wrought;
Quite suddenly, the half-closed door
Flew open, and there stood before
Me, one whose face and features wild,
Would have gained the trust of a little child.
His form was bent, and his hair was gray,
And the vigor of life had passed away;
But as heavily on his staff he leaned,
Old age had never so beautiful seemed;
For though his brow was furrowed with care,
His smile was most serene and fair
As if he'd thought for a long, long time
Of a better world and a sinless clime.
At last he spoke: "My dear young woman," said he,
"You have been thinking to-night, of me.
Of the change that I, in you have wrought,
Of the lessons that I in love have taught,
Of the oft repentant and bitter tear,
Seen by none but the old, old Year.
The varied year that is well-nigh gone
Must yield to Eighteen-Hundred and Eighty-One.
E'en now the effort to draw my breath
Warns me of my approaching death;
And the elements meeting in bitter strife.
Speak sadly of my departing life,
But I go to a land where burden and care
Are wholly unknown, and everywhere
There reigneth peace, unsullied and free;
A rest that cannot abate, for me.
And now, I'd ask, is there anything
Which you'd have no longer to memory cling?
Of all the secrets your heart has kept,
Of all the sorrows o'er which you have wept,
Have you nothing to send to unconscious bliss?
Naught for the land of forgetfulness?"
"Aye, father," I cried, "there are many things
Which call for a blush as memory brings
Before the eye of my mind, the light
Of deeds that I cannot undo to-night.
Take with you thoughts of the broken vow,
Whose fragments can only be mourned over now;
Of the angry look, and the careless tone,
By which I've thrust the lonely down;
Of the weakness with which I've grown tired of life,
Have neglected duty and inclined to strife;
The failure to do what I've often resolved,
The deaf ear I've turned when conscience has called,
O, blot them all out in forgetfulness
That I may no longer remember this."
"Ah, you are like all the rest, my child,"
The old man said, with his smile so mild,
"You would open the door that memory holds fast,
And bury sad truths in the dead, dead past.
But do you not know that the angry look
Has shown you your heart like a well-written book?
That the ceaseless tone, and the tending to strife,
Have shown you the need of Christ in your life?
That the failure to do what you've often resolved
Has taught you to *heed* when conscience has called!
And do you not know that should I become
The sexton to bury your thoughts in the tomb,
You would learn to trust in your own human hand,
And build your house on the treacherous sand?
Ah, no! let your mind call up now and then,
The saddest of words, 'It might have been,'
To teach you to look to a Power above,
To fashion your life in the depths of His love;
That its lamp, trimmed and burning, constantly may
Shine brighter and brighter to the sweet, perfect day.
Far better to part with injuries given
By those who often and often have striven
To wrong you in thought, in word, and in deed,
And left you to struggle alone in your need;
Far better to bury them deep in the tomb,
And leave sweet charity's flower to bloom
O'er their graves, for you'll surely find, then,
Of all *sweet* words of tongue or of pen,
The sweetest, to tunes of peace are set,
And are simply these: '*Forgive and Forget.*'"
He ceased to speak, and I gazed on his face,
So grandly calm in its dying grace,
And I touched his arm, as I whispered, and said:
"Father, Thou'rt right. Among the dead
Bury the thoughts that have clung so strong
To me, of those who have treated me wrong;
I forgive as I hope to be forgiven
By the mercy of Him who dwells in Heaven."
He smiled, but to speak he'd lost the power,
For the clock was striking his dying hour.
But he cheerily waved his hand at the last,
And was borne away on the wings of the past.
My dreaming was over. I sprang to my feet,
In a burst of song the New Year to meet,
Dashing away the last, sad tear,
I had shed for the death of the old, Old Year.

NOTICE.

IN consequence of the increased demand for space to accommodate the "Corn" subject, the "Literary Department" has been curtailed to a great extent and that of the "Woman's" entirely left out.

We ask indulgence from those who enjoy these particular features, promising to do our best to keep our *practical* neighbors from trespassing.

R. C.

THE family were telling riddles one evening, and the five year-old told this:

"Four little hopper-toads sat on a tree,
Two hopped off and then there were three."

Nobody could guess it. "Well," she explained, "one of them hopped right back again." "Who told you that riddle?" asked mamma. "Nobody," replied the little one. "I thunk it up myself:"

LORD C——, whose popularity was not excessive in the Scotch town of A——, having refused an importunate beggar, she renewed her application with, "Now me lord, if ye'd just give me one little sixpence I could treat every friend ye have in the town."

THE RURAL NEW-YORKER.

AT this season of the year we are receiving many calls for specimen copies. For the information of the new readers into whose hands the present number may fall, we present a list of those who may be considered as the present contributors to our columns; from which it may be seen whether or not our claim to having the most eminent practical writers is well founded.

PERSONAL ITEMS.

Mayor Stokley, of Philadelphia, when a boy, worked for a dollar a week and slept under a counter.

Gen. Jeff. C. Davis's widow has ordered a monument for his grave like the Wool monument at Troy, N. Y.

Mrs. Emma W. Skelton observed the 103d anniversary of her birthday at the Old Ladies' Home in Boston on the 18th.

Mr. Pendleton, of Ohio, has introduced a bill in the Senate for regulating appointments to office and the conduct of office-holders.

Mrs. Julia Shayer, the author of delightful sketches of Washington life, is the daughter of a clergyman residing in Deering, Maine.

William H. Vanderbilt is supposed to own about one-fourth of the stock of the Western Union Telegraph Company, representing ten millions of dollars.

General Hancock has been presented with a silver-mounted stick cut from the hickory tree on the Hancock farm in Pennsylvania, where he was born.

Rev. Dr. Talmage is again to be "hauled over the coals" by his enemies in the Brooklyn Presbytery, who claim to have new evidence of his deceit and falsehood.

General O. O Howard, who has been assigned to the command of the West Point Military Academy, will go to California to settle up his private matters preparatory to entering upon his new duties.

Mrs. A. T. Stewart leads as quiet and amiable a life as any rich woman in the country. She is much attached to the Episcopal Church, and solely sustains the Bishopric of Long Island, to which appertain the cathedral and schools of Garden City.

The Atlanta Constitution says there is a keener appreciation of Mr. Lincoln's character and genius at the South than at the North. R. J. Burdette, who has been lecturing at the South, says he has been amazed by the applause which greeted his eulogy of Lincoln.

"Gratitude and Duty."

Hon. Wm. D. Kelley says in a letter to Dr. Starkey: "Gratitude to you and duty to those who may be suffering as I was from Chronic Catarrh and almost daily effusions of blood, in greater or less quantities, impel me to say to you, and *to authorize you to give any degree of publicity to my assertion*, that the use of your Compound Oxygen at intervals has so far restored my health that I am not conscious of having discharged any blood for more than a year; and my cough, the severity of which made me a frequent object of sympathy, has disappeared." Our Treatise on Compound Oxygen sent free. Address Drs. STARKEY & PALEN, 1109 and 1111 Girard St., Phila.

Choice Varieties of Seed Corn.

Blount's White Prolific.—An early eight-rowed white flint variety, with short, uniform, well-shaped ears. Remarkably prolific, averaging six and eight good-sized ears on each stalk. Per ear, 8 cents; doz., 75; hundred, $5.00, shelled, per quart, 20 cents; peck, $1.00; bushel, $3.00.

Large White Flint, or Hominy.—A very handsome and productive variety; long full ears of fine plump grain. Per ear, 5 cents; doz., 50; hundred, $2.50; shelled, per quart, 20 cents; peck, $1.00; bush., $3.00.

Premium Chester County Mammoth.—This variety, wherever introduced, has given universal satisfaction, both on account of its large yields, fine quality of grain, and superior fodder. All who have tried it strongly recommend it. It is an acquisition which farmers cannot fail to appreciate. Per ear, 8 cents; doz., 75; hundred, $5.00; shelled, per quart, 20 cents; peck, $1.00; bush., $3.00.

Queen of the Prairie.—A variety of Yellow Dent Corn from the West, which has been carefully selected by the growers for several years past, and is one of the earliest varieties of field corn in cultivation. It was planted the past season on Long Island, after the harvesting of the wheat crop, and matured the crop perfectly. Selected ears by mail, 20 cents each; shelled, peck, $1.25; bushel, $3.50; three pounds by mail, post-paid, $1.00.

The Earliest Sweet Corn in Cultivation—Dolly Dutton—A very dwarf-growing sort, with ears averaging from four to six inches in length; very sweet and delicious. Per pkt, 10 cents; quart, 50; peck, $2.00; bush., $3.00; select ears 75 cents per dozen; by mail, $1.00 per dozen.

Five cents per ear, ten cents per pint, twenty cents per quart extra for postage on Corn of all kinds when ordered by mail.

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME.

VOL. XL. No. 2. WHOLE No. 1615. | NEW YORK, JAN. 8, 1881. | PRICE FIVE CENTS, $2.00 PER YEAR.

[Entered according to Act of Congress, in the year 1880, by the Rural New-Yorker, in the office of the Librarian of Congress at Washington.]

The Herdsman.

SHORT-HORN BULL LORD UPTON.

Second Prize N. Y. State Show, at Albany, 1880.

THE engraving herewith presented is an accurate reproduction, by our artist, of a photograph taken for the RURAL on the fair grounds. The bull, a handsome roan, was bred by the exhibitor, Mr. Wm. S. Moore, Jr., of Mt. Upton, N. Y., whose herd, as represented at the fair, certainly did him credit. Lord Upton's sire was bred by Mr. D. W. Bartlett, of East Windsor, Conn., one of the most discriminating of the breeders of the Connecticut milking Short-horns, and the subject of our sketch is no doubt a good representative of that blood. His dam is also of a family reputed to be great milkers, so that while no doubt in points and style he is worthy the honor he wins, in point of usefulness as a dairy sire his pedigree is a most promising one.

NOTES BY A STOCKMAN.

I SAID recently: "The great bugbear of farmers in this business (breeding) is close breeding." Thereupon Mr. Jonathan Talcott takes issue and propounds a question as follows:—"If Mr. Bates was so successful in his breeding, where are the descendants of Duchess at this date?" What a field of thought this question opens up! It reminds me of the tradition of one of the noble aborigines of this continent, who when questioned as to the number of his tribe and people, pointed to the forest spreading beyond the reach of the eye and said "as the leaves of the forest, so are my people."

Where has not the Bates blood spread? There are the Duchesses, the Princesses, the Oxfords, Red Roses, Wild Eyes and other noted families, all bred by the same methods as the first, and their blood has flowed in every direction in all civilized lands until it has colored an ocean. Who can trace even the Duchess streams to its present limits? It flows over the plains of the West, of Australia and New Zealand. It appears more or less diluted in every beef market where Short-horn grades supply the shambles. It is not confined to the central concentrated receptacles, the numerous Dukes of this and Duchesses of that, that may be pointed out wherever Short-horn breeding is carried on; but it spreads everywhere.

Let Mr. Talcott consider the splendid picture of Baron Hillhurst which abuts close to his communication on the first page of the RURAL; (and which by the way is one of the best specimens of animal portraiture I have ever seen engraved) and he will see an example of what I wanted to teach That noble animal is the product of the closest breeding ever practiced by the founder of its ancestral families, who was one of the closest of breeders that ever existed.

It is the fashion with objectors to this close breeding to ask precisely this question of Mr. Talcott. But if there was not one direct purely descended Duke or Duchess remaining, it would be no argument against the system by which this wonderful family was produced and made to serve the most valuable and useful purposes to produce effects that are unparalleled.

Therefore a Duke or Duchess even now is sought for with eagerness and brings about its live weight in silver dollars.

But, again, there was but one Thomas Bates!

His system has been adopted by every successful breeder. Bakewell doubtless taught it to him, for Bakewell was the first breeder who applied in-and-in breeding as a system. Of him a noted breeder said in 1786, "Mr. Bakewell has not had a cross for upwards of 20 years; his best stock have been most closely bred; yet they have not decreased in size; are not less hardy or healthful, but, on the contrary, have kept in a progressive state of improvement." This was said in reference to Mr. Bakewell's cattle. What he did with his sheep under the same method is so well known as to need mere reference.

Webb with his South-Downs followed Mr. Bates's system. And the Webb and Walsingham sheep tell their own story. He did the very same with his tribe of Short-horns, and with the same conspicuous success.

Curiously enough an open page of the Agricultural Gazette has just caught my eye, and I find there the following reference to this very noted Celia tribe of Short-horns. It originated thusly: "Millbank had a son Driffield. *Driffield was put to his dam* and produced young Millbank. Patriot was got by Driffield out of Millbank's grand-daughter. Young Millbank produced Crimson by Patriot. Crimson produced Charlotte by Palmflower, her own brother." And so on, a perfect concentration of blood and breeding until Celia appears and founds her tribe. This was done by that eminent breeder Mr. G. Coates, and Mr. Jonas Webb went on where he left off, until his death.

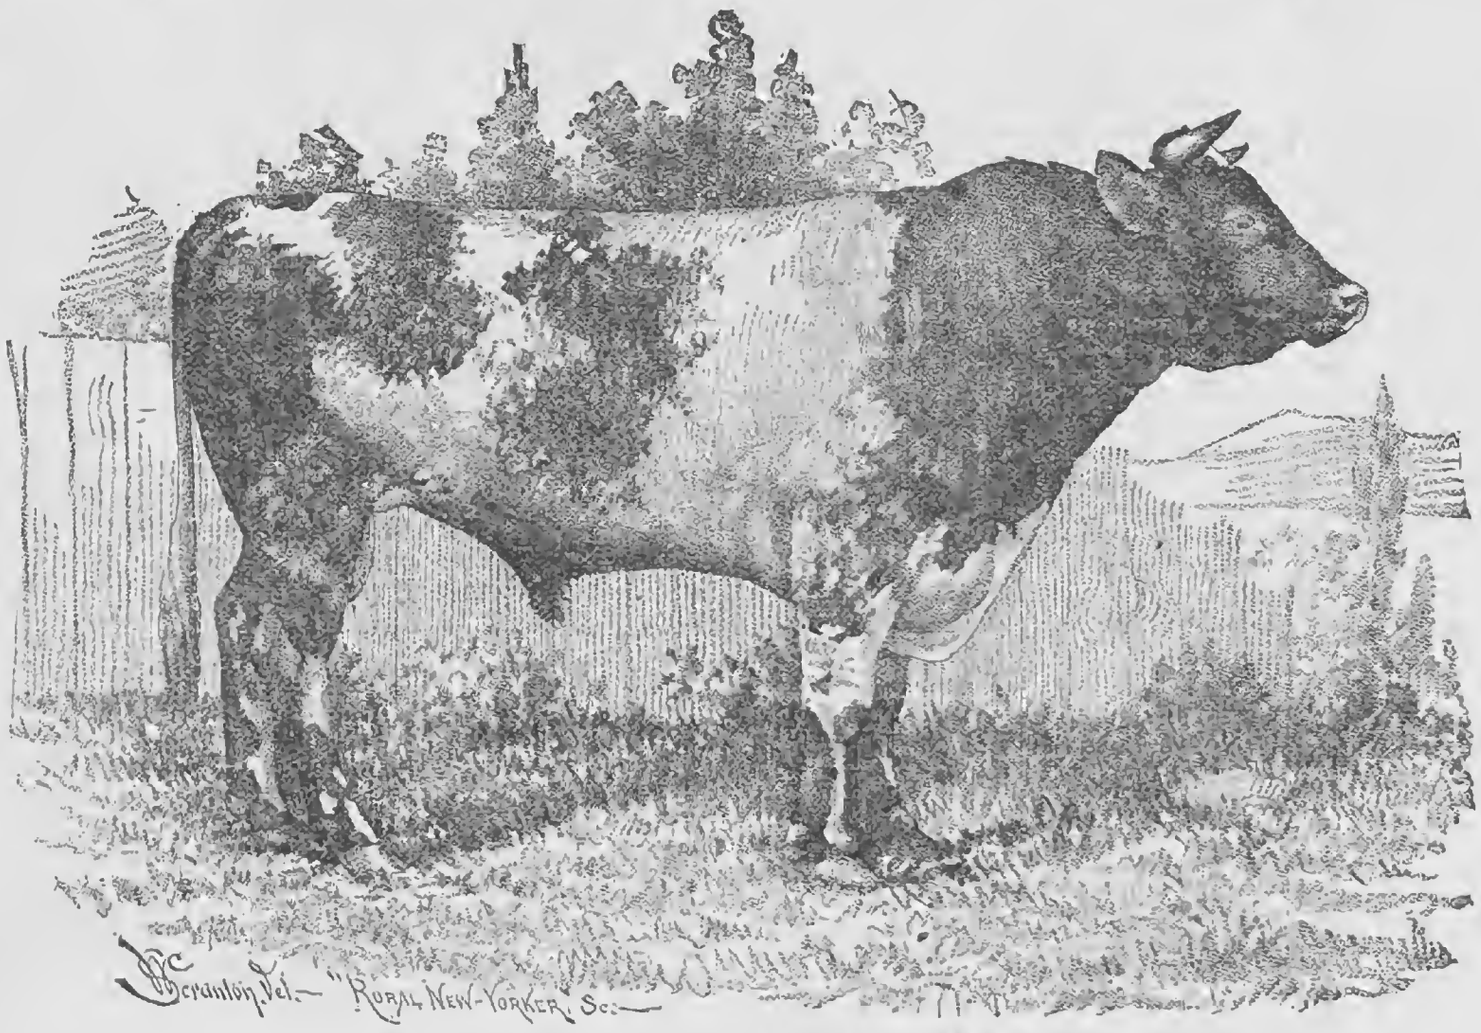
I think I remarked something about prejudice in this connection. I don't wish to say for a moment that Mr. Talcott is prejudiced, for that argues, to some extent, want of intelligent and reasonable thought and consideration of which I know Mr. Talcott posseses an ample power. But against the objections made to this practice we have the whole history of successful breeding of horses, cattle, sheep, pigs, dogs, fowls and even of the domestic canary birds, which have been brought to the greatest elegance of form, brilliance of color and sweetness of song by what the English objectors call "ower 'sib' breeding," meaning too close relationship.

Well; "the end justifies the means" in breeding, however inapplicable it may be in morals.

What instances I could bring home to Mr. Talcott, here "in our own country and among our own people," in the stall, the dairy, the flock, the pen, if I had but space—and I had not, this moment, to milk and feed and clean up—which ought to have been done an hour ago.

But—"we can have too much of a good thing" and one should know just where to stop. Not knowing precisely where this point is, is just what's the matter with a good many breeders. And the puzzlesome science of mathematics cannot hold a candle to the science of breeding and few there be that find it out.

THE HOLSTEIN BREEDERS' ASSOCIATION OF AMERICA.—In view of the sterling merits and growing popularity of the Holstein breed of cattle, we are glad to see that the above Association has been incorporated under the laws of this State. The objects of the Association are to improve the breed of thoroughbred Holstein cattle; to ascertain, preserve and disseminate all useful information as to their pedigrees and admirable qualities, as well as the distinguishing characteristics of the best specimens; to publish a Holstein Herd Book; and generally to pomote the best interests of the importers, breeders and owners of such cattle. The present officers of the association are:—Edward A. Powell, Pres; Charles Houghton, Sec; W. C. Brayton, Treas; and Gerritt S. Miller, Vice-Pres. Any person interested in the breeding of Holstein cattle who is also an owner of animals of that breed is eligible for membership and on sending an application to the Secretary, together with a membership fee of $15, a certificate of membership will be sent to him, provided he is admitted by a unanimous vote of the board of officers. Blank forms of application and all needed information will be promptly furnished by Charles Houghton, Whitestown, N. Y.



SHORT-HORN BULL, LORD UPTON.—Fig. 12.

Farm Economy.

APPLES FOR STOCK.

CLINTON.

THE past season has been unusually productive of an abundant yield of apples in all Central New York, as well as elsewhere. The yield has, in fact, been so very great that the market for this valuable fruit has been absolutely glutted. Of course, being so plentiful, a larger quantity than usual finds a home market in the family, or among near friends and neighbors. But where these have all been supplied in profusion the question arises, What shall be done with the surplus? Those living near a good market will, of course, be able to work it off gradually, at some profit, but those living at any considerable distance from such market have hardly felt compensated for the careful picking, packing and hauling necessary to avail themselves of such market, at the low price of 50 to 60 cents per barrel for the finest grafted fruit, for when there is an abundance, only the very finest and the most carefully assorted and handled will be accepted by the dealers. A small quantity can be made into cider for vinegar and culinary purposes, but beyond that the *temperate* will not care to go. And to gather the apples and haul them any considerable distance to a cidermill, for sale at from only five to seven cents per bushel, is surely not a very profitable business for a farmer who has his corn, his potatoes and other vegetables to attend to, besides the thousand and one things always necessary to be looked after on the approach of Winter. The question then arises, What use shall we make of the surplus apple crop, that will be most remunerative?

My answer has always been, in such cases, store them carefully and use them as Winter feed for your stock. They will be valuable for such use, especially with the present rather light supply of hay in the country. My experience and experiments, running through a long series of years, have convinced me that apples are valuable for such use, for either cattle, horses, sheep or store pigs. I do not claim that the fattening properties of apples are very great, but I do claim that they are not destitute of nutriment, and that their use for animals, kept mainly on dry food during our long Winters, is highly beneficial in aiding the appetite and the digestion, and thus giving a healthful tone to the system. When prop-

erly fed they increase the flow of milk in cows without impairing the quality, and I value a daily feed of apples for the horse as highly as I do one of carrots. The horse is a great lover of apples, in that respect equaling any schoolboy. If, when you visit the horse in his stable in Winter, you will make it a rule to give him, now and then, the treat of an apple, you will soon find that you have gained his affections and confidence, and that he will always greet you with pleasure. Indeed, I have found that when I have desired to catch a horse that is in pasture, an apple or two are always more attractive to him than a taste of either salt or grain, besides being much more convenient to carry. My conclusion is that for sheep, and especially for breeding ewes, kept mostly on dry hay, they are valuable as a preventive of costiveness, and that, on the whole, they are as valuable for feed for stock in general in Winter, in proportion to their weight, as the roots usually grown for that purpose, and *more* valuable than the common flat turnip, while the milk of the dairy is entirely free from any unpleasant taste or odor arising from their use. But in the commencement of their use proper judgment should be exercised, as in every other case of a sudden change of food with animals. The change should be somewhat gradual, increasing the amount as the animal's system becomes accustomed to the change, and the feed may be increased till, we will say, about one peck is given at a feed to each horse or full-grown cow or steer, and in a similar proportion to the young cattle or sheep. For colts they are invaluable, if properly fed.

But here I am met by an article which I find is going the rounds of the country newspapers and, under the head of "Facts for Farmers," cautioning them against the use of apples as a food for stock, as likely to be productive of injury. The article appears anonymously and no hint is given as to the quarter where it originated. Besides this, it seems to me to be too absurd to be worthy of any consideration, were it not that it may, perchance, alarm or influence some young or inexperienced stock grower, to his detriment. Therefore I refer to it in passing. I quote a portion of the article: "Some farmers near Middletown claim to have discovered that their cattle, when fed on apples, have shown every evidence of drunkenness. One farmer claims that his cows staggered about so that he had to watch them all day to prevent them from falling into the creek." The explanation given is, that the cow, being a ruminating animal, allows the apples to "remain so long in the first stomach that fermentation commences," and, of course, progresses sufficiently to produce intoxication! Surprising theory that! Now we are not even informed what particular "Middletown" is referred to, "near" which such extraordinary occurrences were noticed, and where the cows were so unusually dilatory in "chewing the end," as the writer expresses it. There are in the United States no less than 18 "Middletowns," having different locations. We are not informed whether the one referred to is in Connecticut, in New York, or in the *moon*. We rather incline to think it is in the latter place, or at least that the originator of the theory was a little *moon-struck* when he advanced it, for the idea that any article of food will remain in the stomach of any healthy animal, man or beast, so long before it is digested as to undergo such a kind of fermentation as will produce *intoxication*, is preposterous, and is a direct impeachment of the wisdom and goodness of the Almighty. If it be true, why may not similar results be produced by feeding the meal of any grain? for meal, after undergoing a certain amount of fermentation, will certainly evolve a much greater amount of alcohol in proportion to its bulk than crushed or masticated apples can possibly do: otherwise chemistry and all experience have been sadly at fault. And I am yet to learn that meal does not remain for as long a time in the stomach of *any* animal to ferment and evolve its intoxicating principles as do apples. If the theory advanced in the article quoted be correct, then it strikes me the pledge administered by our temperance advocates should include in its prohibitions the feeding to our animals of anything which is likely, by its fermentation in their stomachs, to produce "drunkenness," as in the case of the cows mentioned. But the idea is too preposterous to be followed further. My only, or greatest, wonder is that any *intelligent* editor should copy it among his "Facts for Farmers." He must place a low estimate on the intelligence of farmers.

My own experience prompts me to continue to practice, and also to recommend to others, the free use of apples, both for man and beast, especially during the Winter season, when there is so little other green food for use, as being not only nutritious, but as being such a regulator of the system as is necessary for its welfare, and therefore highly conducive to its health. Of course, I intend this recommendation only for such as are in ordinary health, and then to be used with some judgment, or at least with *common sense*.

Dairy Husbandry.

THE DAIRY COW—NO. 20.

HENRY STEWART.

Butter Making—Churns and Churning.

The importance of butter-making may be estimated from the fact that several hundred patents have been taken out for churns. Most of these are designed to save labor in operating the churn; and to change the common up-and-down motion into an easier rotary motion. Others base their claims upon the formation of the dasher, by which the objectionable rubbing effect upon the butter, and the consequent damage to its texture are avoided. Others, again, claim an improvement in abolishing the dasher altogether and effecting the reduction of the cream into butter by the agitation and concussion of the former upon the sides and covers of the churn. All the varying differences in the multitude of churns may be classed in accordance with the above three main principles, and all of them are based upon some simple facts which relate to the formation of butter in the churn. These may be summed up as follows:

Cream consists of the aggregated butter globules of the milk, mixed with a portion of milk which fills the interstices between them, and which adheres to them by capillary or superficial attraction. As the butter globules rise to the surface they take with them this adhering milk, which remains in close contact with them and separates them one from another. Under the microscope, milk and cream appear as at A, figure 13, and differ only in their proportionate contents of butter globules. Each globule, however, seems to be coated with a firmer envelope than one of liquid milk, but this is probably nothing more than a closely adhering film of the milk held by superficial attraction, just as any foreign body placed in a liquid draws to its surface an envelope of the liquid and holds it in close contact. As long as the butter globules are thus suspended in the milk or the cream, they keep themselves separate by virtue of a molecular attraction of the particles of oil by which they gather into small spheres or round bodies precisely as the small drops of quicksilver remain separate when a quantity of it is dropped on to a plate or flat surface; and as these may be brought together and mingled into a mass by agitation, so the butter globules may be brought together into a mass as soon as they are violently agitated and the enveloping medium is forced by pressure or friction from between them, in the churn. The natural affinity of related particles, the common process of aggregation, in fact, brings the butter globules together into a mass as soon as the separating fluid is forced from between them.

The whole operation of the most perfect churning then depends upon the most effective method of bringing about this result. Some knowledge of the commonest principles of machines will enable any one to distinguish between the various methods of churning and to choose that system or process which is the easiest and most effective. The better designed the churn may be for its special purpose, the more rapidly and the more easily the churning is effected. The more thorough the agitation and concussion in the churn, the sooner the result will be reached. But rotary motion is more easy than perpendicular motion, and in small dairies where the work is done by hand the old-fashioned up-and-down churn is discarded and the crank churns are used. But to turn a dasher, which is made to revolve in the cream, is more laborious than to simply turn around a box in which the cream is placed, without any dasher, and so the dashless churns are coming into use very extensively.

The peculiar and different motion of the cream in these three churns may be understood by means of the following illustrations. In the up-and-down churn B, fig. 13, the action is seen to be very defective. The flaring sides of the churn leave a wide space between them and the dasher, which is necessarily smaller than the narrow opening at the top through which it is inserted. This permits the cream to pass through too easily and with but very little friction or pressure, leaving the most of the work to be done by concussion. This is very feeble on account of the almost upright sides and the elevated top against which the cream is thrown with but slight force. The chief part of the work is really done by the pounding of the dasher on to the cream, and the forcing of this against the bottom and lower part of the churn. These effects being very imperfectly produced, the churning, of course, occupies a long time, and for hand-work this kind of churn is the most laborious of any.

The revolving dash-churn C, of which the excellent one known as the Blanchard is a good type, is far more effective, both on account of the better concussion and the ease of operating it. But it has the disadvantage of carrying around with the dasher a large portion of the cream, and of exerting the best effect only at the extremity of the dashers where the cream is seen, as at C, to be thrown against the sides and top of the churn with force.

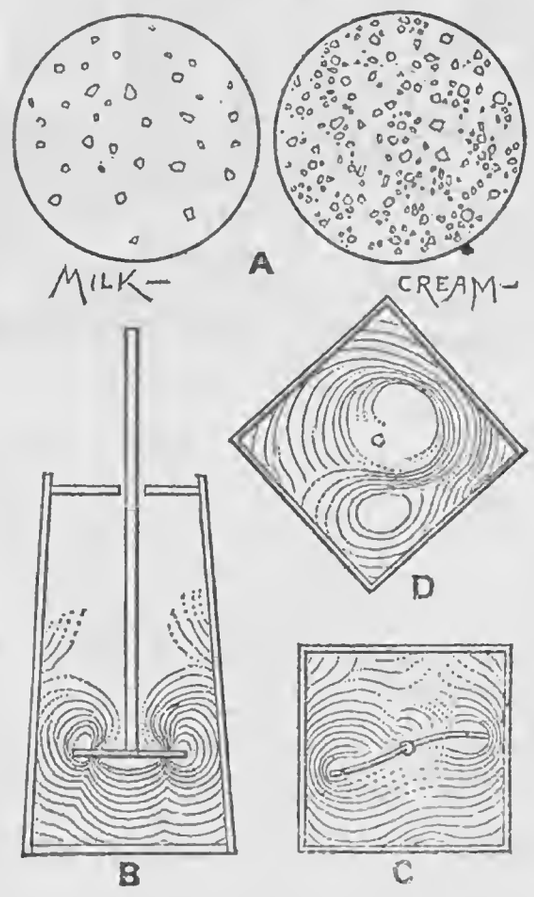


FIG. 13

The revolving churn, which itself is rotated and has no dash, produces the requisite concussion and agitation most perfectly. In this the cream in a compact body is thrown with great force on to the opposite side of the churn, and in rebounding meets the adjacent side and is dashed against that, and so on continuously (D). This effect is greatly increased by a method of hanging the churn by two diagonally opposite corners, which causes the cream to be thrown in many more directions and increases the agitation to its utmost limit, making cross currents in the mass which greatly add to the friction. This effect is so complete that the principle involved in it is made use of in some factories where small articles are smoothed and polished by friction against each other, as they are rotated in a barrel or box. It is an application of precisely the mechanical effects of churning, and it has been found that the rectangular box hung upon opposite corners completes the polishing much more rapidly than any other device.

The effect of the churning is increased up to its most complete point when the churn is only half filled. In the up-and-down churn there should not be so much as this to produce the best effect, and much difficulty in churning arises from this unsuspected cause, viz., putting too much cream in the churn. It will be evident that if the churn were completely filled, the necessary concussive action could not take place at all, and this action will be increased more and more as the quantity of cream in the churn is reduced, until the point is reached when the action is the most effective. In the up-and-down churn this point is when the cream in the churn is but a few inches in depth; in the revolving dash churn, when it is less than half full and the cream does not reach to the shaft of the dasher; and in the rectangular, dashless churns, when they are a little less than half full. When more cream than this is put in either of the churns, the time of churning is lengthened in proportion to the increased quantity.

DAIRY FLOOR WIPER.

A HANDY DAIRY-FLOOR WIPER is shown at figure 14. It consists of a strip of vulcanized rubber attached, as shown, to a flat piece of wood, beyond which it projects about an inch. A handle is inserted in the piece of wood, and

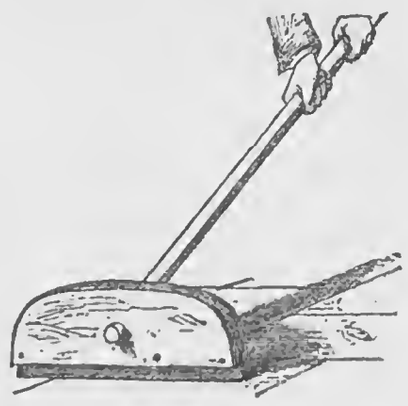

FIG. 14.

thus is formed a cheap and convenient implement that saves time and money in the dairy, as its use there leaves the floor nearly dry. Milk, whey and other slops soon decay in such places, vitiating the air and imparting an injurious odor to the cheese or butter made from the milk or cream kept there. The floor, therefore, should be frequently scrubbed and washed, especially in warm weather, and the above implement will be found very useful.

The Poultry Yard.

KEEPING EGGS.

THE hen, properly speaking, is an artificial creature, and just as our plethoric and "diseased roots" called mangels, turnips, etc., originated from insignificant wild specimens, so the hen, with her nine to fifteen dozens of eggs a year, is the cultivated and civilized result from a single or, at best, a double-dozened bird in the jungle. While we are at liberty to admire her cultivation up to the present standard, yet as she delivers these eggs mostly in one season of the year, she is to that measure inconvenient, and should in some way be induced to spread her favors more evenly over the whole year and thus give us eggs at a time when most needed, as in the Winter, during the absence of fresh vegetables and fruit. The art of artificial incubation will have a tendency, as it becomes more universally adopted, to do away with the brooding characteristics of fowls and make the non-sitting breeds more popular, and thus abolish the desire on the part of hens to lay more eggs at one season than another. The question of accommodations cuts much figure in it, too, for a poorly-fed hen when wet and cold can have little desire to propagate her species, and we needs must look somewhere for a substitute for Winter layers.

The best plan hit upon so far is a method for preserving eggs fresh from the time they are laid in the Spring and Summer until the demand increases for them in Winter. To accomplish this many plans have been devised. We notice in the poultry papers quite a number of recipes or devices. Some claim that eggs should be oiled or greased to keep out the air; others that they should be turned once a day, and an ingenious plan is suggested—to fill a bag with eggs wrapped in paper and have a loop on both ends to hang it up by one end one day and the other end the next day. While we can understand the necessity for turning eggs while hatching in order to get the heat on all sides, we fail to see the keeping quality of this process, though we know it is quite universally practiced.

Keeping eggs is quite a feature in commerce, where they change hands under the common name of "limed eggs," whether they have ever been near lime or not. Almost every merchant that deals at all extensively in eggs has a secret pickle of his own to keep them in. A correspondent of the Western Rural gives the following recipe for a pickle: "Take five quarts of rock-salt, five pounds of unslaked lime and a quarter of a pound of cream-of-tartar; dissolve in four pails of water, which make sufficient pickle for a barrel of eggs." Then there is cold storage for holding eggs along with butter and cheese. At the last meeting of the National Butter, Cheese and Egg Association, held at Indianapolis, there was quite a discussion between the egg merchants present as to what was the best temperature for holding eggs for long storage. We give their ideas in their own language:—

Mr. J. A. Smith, of New York—I think the egg trade of this country the most irregular trade that we have. A storage house properly constructed, properly put up, will keep eggs three months, possibly four months. They should be worked off within four months. Three months is as long as any eggs should be held in cold storage. I have never known but one way to hold eggs in cold storage to hold them properly, so that they came out good, and that is, take good oats (the oats must be perfectly dry, sweet and clean); get every particle of dust out of them, then pack the eggs in them. If you pack eggs in musty oats they will certainly be useless when they come out. They should be in a temperature of 36° to 40°. The reason so much is said against this cold storage is, that eggs are not properly packed; they are put in musty straw.

Mr. Gilbough—I have had 15 years' experience in keeping eggs in cold storage. If eggs are taken fresh and placed in cold storage they can be safely kept. It has resulted profitably to me. First, get fresh eggs, take out all dirty or soiled eggs; get the very best oats—the cleanest and the best—put them through the fanning-mill and take all the dust out, and pack the eggs in cold storage of about 45°. When we take them out of the cold storage we let them stand, so that they may become of the same temperature as the atmosphere around them.

Mr. A. Albro—I move to hold eggs any length of time in cold storage—36° to 40°—should

be considered the proper temperatnre. Motion carried.

MR. TALCOTT AND THE DUCKS.

Mr. Talcott wishes to know how large and deep a pot for young ducks to feed out of should be. It was always my custom to take any pot or pan that was convenient, lay an old stone over it after burying it in the ground, and then put water enough in it to just allow the ducks to reach the bottom with their bills. The larger the pot the better, as it requires filling with water less frequently. It is my custom to keep the young ducks penned up or confined to the chicken yard until they are six or eight weeks old, as they are sure to be lost if allowed to go to the pond.

In regard to their eating whole corn, or, as Mr. Talcott puts it, "at how young an age will the ducks fish out corn *and eat it* if so provided for them;" that will depend upon the breed and growth of the ducks. I have never noted the exact age at which they will swallow a grain of corn, and all I claimed was that it would amuse them; but I think at four weeks of age they will keep the trough or pot clear of corn; but this was never intended to be recommended as the sole feed. On the contrary, I stated that this would amuse them. The ducklings should have their regular feed of coarse corn meal, bran and boiled potatoes all mashed together, twice a day with a grass run if possible. They are excellent foragers in the garden where they will hunt slugs and bugs all day and nearly all night, and do but little harm to fruit or vegetables.

It was never my good fortune to have a small creek for the ducklings to wade in; but if allowed even that with unlimited range, I should expect to lose a large number of them. Water is of no service to them until well feathered when about two months of age, and if their general wants are attended to and a good range in grass and shade is allowed them they will do quite as well without as with a large supply of water. The flavor of the flesh is then better than when they get most of the feed from the pond. L. S. Hardin.

PROFIT IN EGGS.

It has been always considered a mooted question whether or not hens can be made to pay when all the food must be purchased. Hearing of a Mr. James Kelly who carried a considerable flock of hens on a small place and bought all the feed, I was interested to know how his accounts stood. On interviewing him he told me he sold all the eggs at one store where an account was kept, and as he purchased all his feed at the same store a debit and credit account thus appeared with his fowls. He had 85 hens. Last year he made a clean profit with them, for eggs alone, of $196. This year, beginning March 15th, and extending through to November 13th, his account shows a sale of $116 80 worth of eggs and $30 for chickens, with a debit account of $45 80 for feed. He has purchased just two dollars' worth of feed outside of this store, and on November 13th, had about that amount of feed on hand. As there are but two in his family—himself and wife—there can be but little aid in feeding from table scraps. Everything about his place is in convenient order for the well-doing of chickens. He keeps feed constantly before them, which is not always considered the best plan, but here there is an abundant variety—wheat, corn, broken oyster shells, and an abundant range on grass land, and dust baths at hand, besides a wide-open shed facing South to catch the sunshine while enjoying shelter from the cold winds of Winter. He sells his eggs for from 20 to 30 cents a dozen, and as he buys all his feed at one store, of course, he does not get the benefit of bargains he otherwise might obtain. No artificial heat is used in Winter to aid the hens when eggs are highest, so that this is a successful effort unaided by any special preparation or outlay.

L. S. H.

THE SUPPLY OF WATER.

Summer is the season when fowls, like most other animals, require the largest supply of water, yet just now is the time when they are most likely to suffer from the need of a fresh and wholesome supply of it. Those who have never kept fowls in confinement have no idea how much water they drink in 24 hours. They take but one or two sips at a time, but those sips are taken so often that in a day the aggregate amount consumed is quite large.

In Winter, when water freezes so readily, it is quite a problem how to keep fowls in confinement well supplied. Many devices for this purpose have been invented which have turned out more or less successful. Probably the best and only guarantee against absolute freezing up is to have a running stream, and to secure this on a small scale, the best method is to have a barrel of water well protected from frost with a wooden faucet in the end, and to allow this faucet to leak at about the rate of two drops a second into a basin just so deep that the hens can reach the bottom of it when no ice is in it. They can drink from this until it is full of solid ice, when the basin must be thawed out and emptied. Everyone knows that hens cannot lay without a full supply of water; but few know how readily they are made sick by having to drink the water from melted snow or to eat snow.

I have never found it a good plan to add red pepper, Douglas Mixture, or any other compounds to the water. The fowls are too willing to deny themselves the necessary supply of water if it has a repulsive taste to them. The only rational way to doctor a chicken is to catch it and cram the dose down its throat. The process is much easier than most people would imagine. The extra labor required to supply hens with fresh, wholesome water in Winter is a mere trifle, and will be amply repaid, not only be the greater number of eggs laid, but also by the better health of the fowls. No one who has a due regard for the comfort of domestic animals, or even for his own interests will be dilatory in this. Poultryman.

Horticultural.

CRYSTAL WHITE BLACKBERRY.

It seems to me to be about twenty years ago that a few plants of a white blackberry came from a Boston friend. On trial it proved to be of rather poor quality, and was thrown out. The Crystal White may be a seedling of this, or it may be something of another origin. I have only seen the fruit of the latter, and so far as my memory serves me it is of a better quality than the former, and of a purer white. Still, the little I have seen of the fruit has not led me to form a high estimate of its quality, though there is room to hope that it may prove to be the pioneer of a class of white blackberries that shall have excellence as well as novelty to recommend them.

Westchester Co., N. Y. Peter B. Mead.

[We are indebted to Mr. J. T. Lovett for the branch from which the Crystal is drawn.—Eds.]

WHITE BLACKBERRIES.

Some 12 or 15 years ago a friend in the West sent me roots of a white, a red and a black blackberry which he considered novelties as well as acquisitions; but a trial has failed to develop any desirable qualities about them in this soil and climate, unless it be a remarkable tenacity of life, as I have not yet entirely succeeded in eradicating them. The former was truly a white (yellow) blackberry of medium size, about an inch in length by three-quarters of an inch in thickness in the best specimens, of very indifferent quality, and the plants, though very vigorous, were not hardy.

If what is now being sold as "Crystal White" is identical with, or no better than, the above white blackberry, a trial of it will only end in dissatisfaction. Having waged a warfare with the blackberry briars to a greater or less extent for many years past, anything in this line that receives my commendation or toleration must be above mediocrity, which none of the above approached.

Montclair, N. J. E. Williams.

CRYSTAL WHITE BLACKBERRY.—FROM LIFE.—FIG. 15.

RURALISMS.

Winter is the time in which to mature plans for Spring improvements. This kind of headwork is too often avoided and put off till it is too late to think calmly or decide wisely. New members of the guild seem to think it must be very irksome, whereas there is nothing in horticulture more fascinating than planning for the future. Perhaps a suggestion in regard to hedges may be useful to some reader of the Rural. I have in view now a *deciduous* hedge. I have made hedges of all manner of things, from a pear tree to a Japan Quince, the interval embracing a good many pretty things. For a *useful* hedge in the proper place I prefer the pear; but only a few kinds are well adapted for the purpose. For an *ornamental* deciduous hedge almost anywhere, there is nothing to surpass, if to equal, the Japan quince—Cydonia Japonica. There are a number of deciduous plants that make pretty hedges, but the most of them are difficult to form and troublesome to keep in good shape and order. The Cydonia is almost entirely free from these objections, provided only that young plants be used to start with. What a lovely sight it is when in bloom, and how picturesque at all other times. Those who have a fancy for more than one color can use the rose and the white-colored to mix with the crimson. There is this farther to be said in favor of the Japan quince that scarcely any manner of neglect can spoil its beauty. It can be easily and quickly brought into shape again. It will always retain its beauty, though it may lose its primness by neglect to be sheared. No amount of shearing, however, can ever give it that hard, solid, expressionless surface so common to evergreen hedges, or take away its *negligee* beauty, if I may so call it, and for that I like it above all others.

I have heretofore stated that the Japan Climbing Fern (Lygodium scandens) was hardy. The top growth has matured and died, but the lower fronds near the ground are still (Dec. 19) fresh and green, notwithstanding the thermometer has been down to 8°, and the Winter thus far exceptionally cold. As we have a fair promise of zero weather to give the Lygodium a thorough trial, I have not allowed so much as a dried leaf to remain near one plant. If it survives after three years' trial, it may safely be regarded as a hardy plant; and I hope it may, for with its enormous growth out-of-doors and its beautiful fronds, I readily perceive what a useful plant it will be. What a lovely thing it would be in the moist climate of England, where it would be perfectly hardy, if here. The best manner of growing this plant is not yet understood, to judge from what I have seen.

A recent writer in a cotemporary press tells how he has succeeded in grafting the tomato upon the potato. He supposes the operation to be new and original with himself, and goes somewhat into detail over the difficulties he encountered before his efforts were finally successful. There is "nothing new under the sun." This is another zinc label case. Somewhere about 1860 I saw the two plants growing together in this way in the garden of Dr. Siedhof, still an enthusiastic horticulturist. He wrote me a description of his method of performing the grafting, and it was published in the Horticulturist. Whether the writer alluded to above ever saw this published description I cannot say, but his method and Dr. Siedhof's are the same. The result of the grafting is that one gets a small crop of potatoes beneath the surface and a crop of tomatoes above; besides, the experiment is curious and interesting. If it would interest the readers of the Rural, I would tell them how it is done. It is very simple.

The late severe weather has finally browned and destroyed the foliage on my pretty Spiræa Thunbergii, which I lately spoke of as being almost an evergreen. It gave me a great deal of pleasure up to the 15th of December.

Some of our "country cousins" may be surprised to learn that Gen. Jacqueminot Roses are now selling in New York (Dec. 23) for one dollar each at wholesale; and yet there are supposed to be not less than ten acres of glass in New York and its vicinity devoted to forcing this rose alone. I do not know precisely how many acres are devoted to Marechal Niel, but perhaps nearly as many more; and probably half the number to Lamarque. If I should state half the number devoted to Cornelia Cook, Niphetos, Perle des Jardins, Bon Silene and similar popular kinds for Winter florist work, I should hardly be believed. Marechal Niel, one of the grandest and most perfect roses ever raised, and infinitely superior to Gen. Jacqueminot, is now selling for seventy-five cents each—twenty-five cents less than the General. There is a "craze" among young people, however, about Gen. Jacqueminot because of its brilliant color and fine bud. Aside from these two points it has no great merit as a rose, except that it is one of the very few Remontants that will force at all. But boys and girls love to look gay. Fashion is an unreasoning tyrant. Young men struggling in the world to "make both ends meet," pay a dollar for a rose-bud to carry to their sweethearts. Many of them will wish those dollars back again when they go to housekeeping.

Through the kindness of my friend, Mr. Bruggerhof, I have lately had the pleasure of reading some odd numbers of the London Garden. I have never seen a work of any kind more admirably conducted; and this is the more surprising to me since it covers so large a field, and covers it all over, if I may so say, with everything that is pleasing to the eye and good to the taste. I congratulate Mr. Robinson, the editor, that he has been so successful in preparing this delightful weekly feast, and I congratulate English gardeners and others that enjoy the privilege of sitting down to it. While speaking of the "Garden," I must say I am delighted with "Leaflets," by Justicia. He is a man after my own heart. I like the downright heartiness which runs through all the "Leaflets" and keeps them always fresh and green. He is evidently at liberty to write as much or as little as he pleases, and how he pleases; and this liberty is the source of his strength. I would advise the editor of the "Garden" to put no restraint upon him, but to let him go on in his own way.

I wish to drop a caution here, lest I should mislead some of the readers of the RURAL. I find on further experiment, that *pure* alcohol of the proof I use is too strong for the young and tender growth of some plants. It kills the insects, but disfigures the new growth. It should be diluted for plants that are growing. I am now trying a solution of carbolic acid soap with a small proportion of alcohol and a few drops of ammonia added, and am much pleased with it; besides, it makes a cheap compound. The proportions I shall be able to give when I have experimented further, if it proves to be really good. What a boon it will be to the horticultural world when a *cheap* compound shall have been discovered for the destruction of all kinds of insects that infest plants; something without *poison*, easy to apply, and not offensive to use. HORTICOLA.

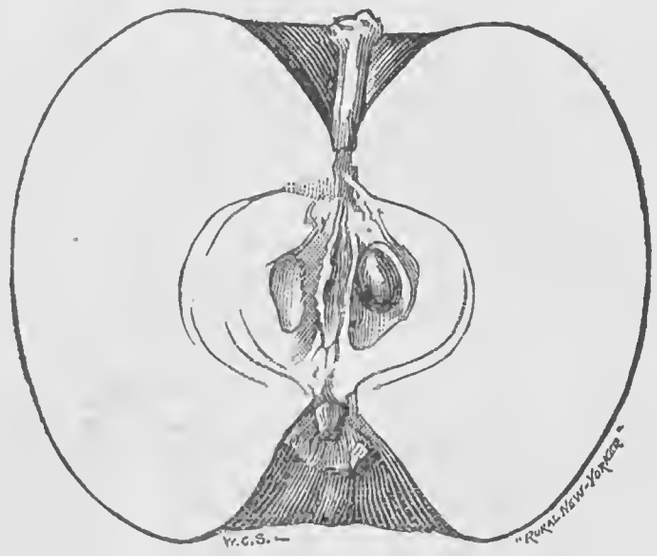
Pomological.

THE WHEATLAND PEACH.

DANIEL E. ROGERS, the originator of this peach, is the largest and most successful grower of peaches in this county. At a time when peach growing here was on the wane, and many thought this profitable industry a thing of the past, Mr. Rogers planted an orchard of 15 acres on strong wheat-producing loam, on an elevation. With no previous experience in field culture, and with little outlay, he made the orchard exceedingly profitable. His success was so remarkable that it produced a furore in peach planting that has not since subsided.

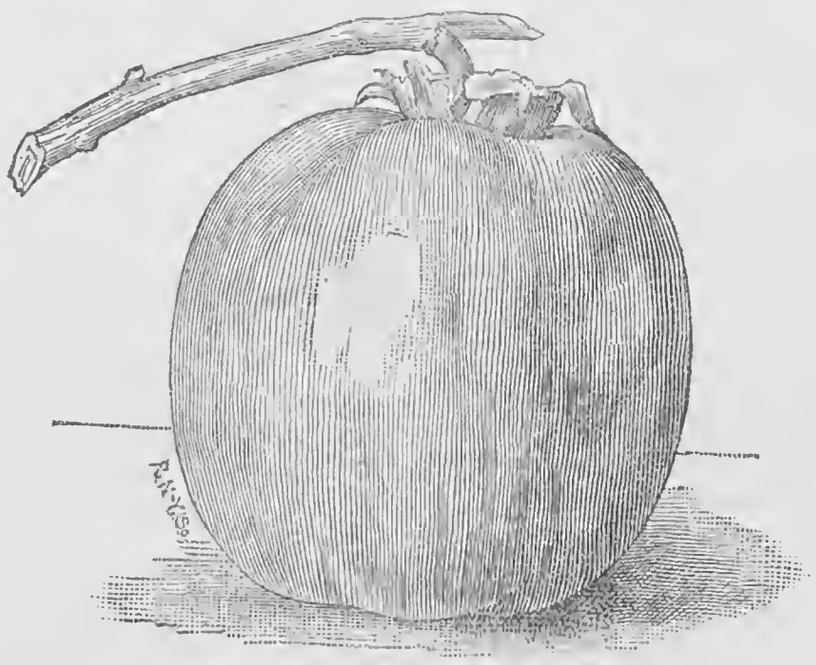
In response to an invitation I drove into Mr. Rogers's orchard, some years ago, with some friends, to learn his methods and to sample his fruits. We attributed his success, 1, to the elevated site. While not properly a hill-top, it commanded the view of a large tract of country. Those fatal late Spring frosts to which the peach here is subject would be much less likely to do injury here than lower down toward the valleys. 2. To the fertility of the soil, and its superior natural drainage. 3. To the thorough cultivation given.

After passing through the orchard, viewing the different varieties in various stages of maturity, Mr. Rogers said he would now show us his favorite. After a short walk he pointed to a peach tree about eight years old, of remarkable vigor and foliage, laden to an alarming extent with uniformly large, yellow fruit with red cheeks. The branches of this strong tree seemed about to give way under their burden, which hung in continuous ribbons, apparently as closely as space would admit. "What peach is this?" I asked, plucking a specimen. "That is just what I want to find out," was the reply. "It was bought for a Crawford's Late, and planted with that variety, but you can see that it is over a week earlier. It ripens when I have no other to market. The top of this tree died back after planting, and sprouts that form the present head came up from below where it was budded."



SUMMER ROSE.—FROM LIFE.—FIG. 16.

Mr. Rogers soon after exhibited peaches from his overburdened tree at the New York State Fair, held at Rochester, where they were awarded the first premium, the late Mr. M. B. Bateham, of Ohio,—than whom there was no better judge—being one of the judges. Mr. Bateham pronounced it a new variety. An enterprising nursery firm subsequently purchased the tree for propagation, naming it the Wheatland, after the town of its nativity.



JAPAN PERSIMMON.—FROM LIFE.—FIG. 17.

The leaves of the Wheatland are exceedingly large and glossy; glands reniform; fruit large, roundish, with moderate suture on one side; skin deep golden yellow, with bright red cheek where exposed; flesh yellow, exceedingly firm, juicy, rich and of good quality; stone free and small. This peach has been visited in bearing by many prominent horticulturists. Mr. A. C. Younglove, the veteran peach and grape grower of Vine Valley, N. Y., reported it at our Western New York Horticultural Society as "the largest, hardiest and best of its season, superior to Crawford's Late; though crowded on the tree, the fruit was all large." The original tree is now 12 years old, and in perfect health. Thirty-nine specimens from this old tree the past season weighed 18 pounds.

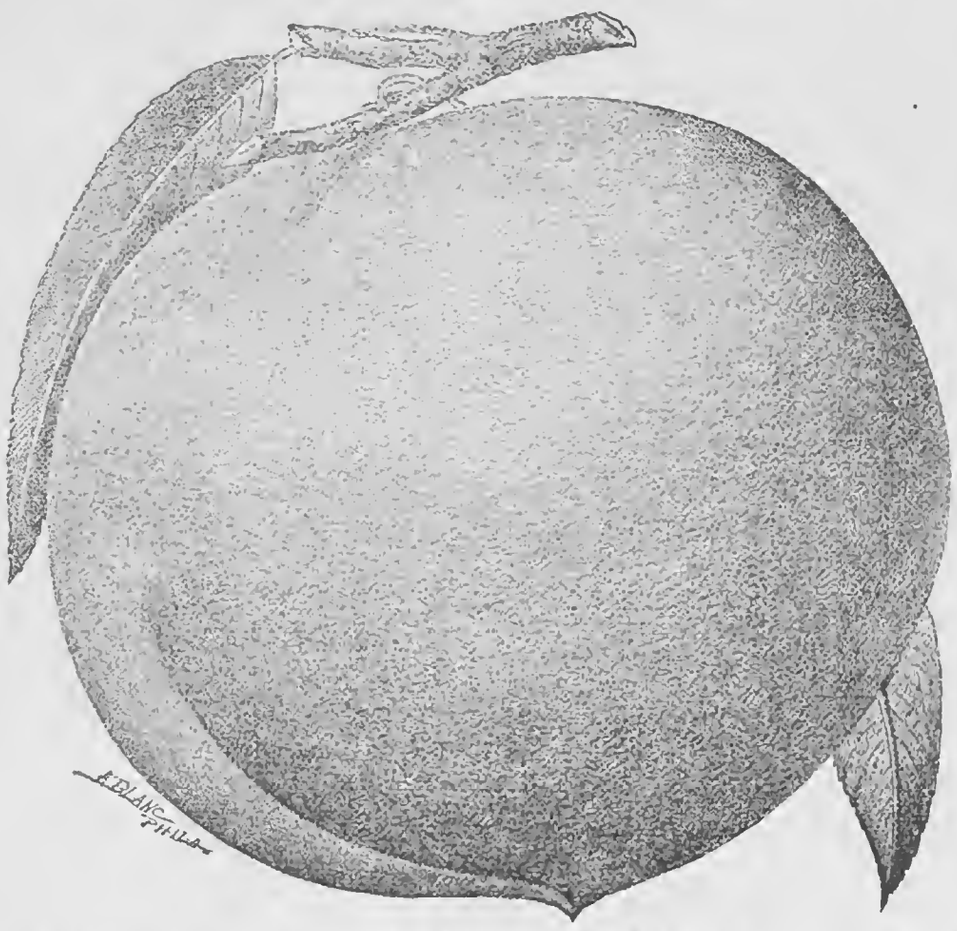
Monroe Co., N. Y. CHARLES A. GREEN.

MORE ABOUT PEACHES.

T. T. LYON.

ABRICOTEE.—We have, for perhaps thirty years, been familiar with a peach, in Eastern Michigan, under the name of Admirable; and more recently we find it in Western Michigan, without name, reproducing itself from seed, without perceptible change. We find it to correspond fully with the description, by Downing, of the Abricotee, Apricot Peach, or Yellow Admirable, and can hardly doubt that it is the same, although he does not mention its ability to reproduce itself from the pit. Although almost destitute of red, it is still an attractive fruit, and has some valuable qualities as a market peach; among which is its late ripening about the last of September.

JACQUES' RARERIPE is large, yellow and showy enough to be popular in the market, where it in common with most other yellow peaches ripening in September, passes among buyers as a Crawford. It seems to be growing in the estimation of Southern Michigan planters. Although popular with those who "buy by the eye," it can never meet the requirements of a discriminating buyer.



THE WHEATLAND PEACH—(From an engraving furnished by Mr. Charles A. Green.)—Fig. 18.

MOORE'S FAVORITE, so far as I am informed, is new in the "Michigan Fruit Belt," although an old variety at the East. It gives promise of value as an excellent dessert fruit, with only a reputation yet to be established for productiveness, to give it position as a market variety. It ripened here, this season, about September 10th; and is certainly good and beautiful enough to command attention.

MUSCOGEE is a child of the extreme South; and came to us, for trial, from L. E. Berckmans, of Georgia. It is an odd, unprepossessing fruit; so repulsive, indeed, in appearance, that it can hardly be expected to win its way among purchasers, although of really excellent quality. Very probably it may put on a more attractive appearance in its own "Sunny South."

OLDMIXON FREE has been so long, so generally and so favorably known everywhere, as to scarcely require a mention. I, however, take occasion to say that it is decidedly growing in favor among planters here, notwithstanding the host of more recent rivals. It is one of the oldest of our still popular market peaches, and is by no means to be ignored as an amateur sort.

THURBER is another of the trial varieties sent us by Mr. Berckmans. Although of good size and well colored, the experience of a single season shows a slight excess of acid, leading me to fear that its high reputation at the South may not be fully sustained under Northern skies.

MORRIS'S WHITE is not yet so old as to be wholly laid aside. It is still considered one of the finest of canning peaches, although it has several competitors. At the West, the later yellow-fleshed varieties to a great extent take its place, even for this purpose. Still it is not without its friends, and will be found in many even of our commercial orchards.

SUSQUEHANNA, notwithstanding its Eastern reputation for unproductiveness, is rising rapidly in favor at the West. Its large size and fine quality no doubt foster this tendency, although there is room for doubt whether its popularity can be permanent. This is doubtless increased by the vigorous habit of the tree.

THE SUMMER ROSE APPLE.

THIS apple is small to medium in size, round, sometimes oblong; stem short; calyx closed, in an even basin; skin smooth and waxen in appearance, streaked with red, generally, over the entire surface when at maturity; flesh tender and of a sprightly, pleasant sub-acid flavor; season last of July to the middle of August. As handsome as wax, and as *good* as it is handsome.

We have grown it for the past 15 years, and esteem it the best of its season with which we are acquainted. The tree is a moderate grower and a fair bearer. The fruit also, from some cause, is usually very fair. While the Astrachan within a few feet will hardly give 25 per cent. of sound, perfect fruit, a much larger percentage of the Summer Rose will be found perfect. Another peculiar feature is, that the smallest specimens, sometimes not over an inch and a half in diameter, will, in quality and flavor, compare very favorably with the largest. E. WILLIAMS.

THE SUMMER ROSE APPLE is one of the best of its season for family use, and will please almost any taste. CHARLES DOWNING.

The Japan Persimmon.

A few weeks ago we received from Mr. John Saul, of Washington, D. C., a specimen of the fruit of the Japan Persimmon, of which the illustration, figure 17, is a true portrait. The tree was grown on the grounds of the Naval Observatory, in Washington, where it has stood uninjured for 20 years. It was brought to this country by the Perry expedition to Japan, more than 25 years ago, together with a few others. This tree has borne fruit during the past two seasons. (See Editorial page.)

Farm Topics.

ENSILAGE.

This subject is at the present time receiving much attention through the agricultural press and yet it is questionable whether it is best for the average farmer to be led away by any undue enthusiasm in that direction. It has always been supposed that the genuine Yankee possessed a good degree of cautiousness, and that before adopting anything new, he was inclined to inquire, "Will it pay?" which is an important consideration before taking any very radical departure from the accustomed routine; and yet, for some reason or other, "Morus multicaulis"-like, "ensilage and silos seem to have caused some to almost run wild. One objection to ensilage is the extra expense that is entailed upon the farmer in the preparation of the silo and the preparation and packing of the fodder. On general principles the average farmer cannot afford to largely increase the running expenses of his farm. It is safe sometimes to try experiments that are inexpensive, or perhaps those which entail some expense, provided the increased benefits therefrom are sufficiently large to justify the outlay. It is not alway

wise for the farmer to desire to be first and foremost in that which is new, for many times he has been awakened to a realizing sense of the idea that he has been humbugged, or, in the words of Dr. Franklin, has "paid too dear for the whistle." Now to construct a silo requires an expenditure of labor and money, and the question to be determined is, will the advantage gained in any way balance the expenditure?

In the first place, what is the advantage, if any? It must consist in the production of some chemical change that increases the feeding value of the fodder or else no benefit is derived. It is very easy for a person to believe what he is anxious for, and so any man who has put out his money in a new enterprise very earnestly desires that he should be benefited thereby, and hence is ready to believe that he really is benefited, when perhaps he is not. Again, persons are apt to speak of an enterprise in which they are engaged as successful because of the mortification that comes from acknowledging a failure.

Some years ago there was a great hue and cry regarding the advantage of cooking food for animals, and yet from the fact that so little is said about it now, and so little food is cooked, it is evident that the benefit did not balance the extra expenditure, so that it is more than probable that a few years will be sufficient to hush the cry about ensilage. Some, more honest than others, even now, after a satisfactory trial, acknowledge themselves disappointed, and express a determination to adhere to the old mode of curing fodder as being more satisfactory, all things considered.

Average farmers should be slow to adopt any person's cherished hobby until on a small scale it can have been tested sufficiently to prove its efficiency and desirability.

Tolland Co., Ct. WILLIAM H. YEOMANS.

A CONVENIENT POWER for dog or goat is shown at figure 20. Such a power can be bought cheaply, or made at home by a neighboring carpenter or handy member of the family, and will, in the course of a year or two,

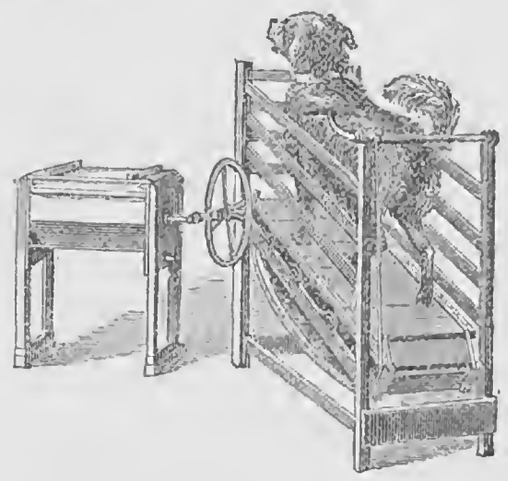


FIG. 20.

save many times its cost, in labor and worry. A little ingenuity will easily attach it to a churn of any sort, or to a cider press; and if more power is needed, a couple of dogs or goats may be used, or that animal so common across the Atlantic, but so rare here—a donkey.

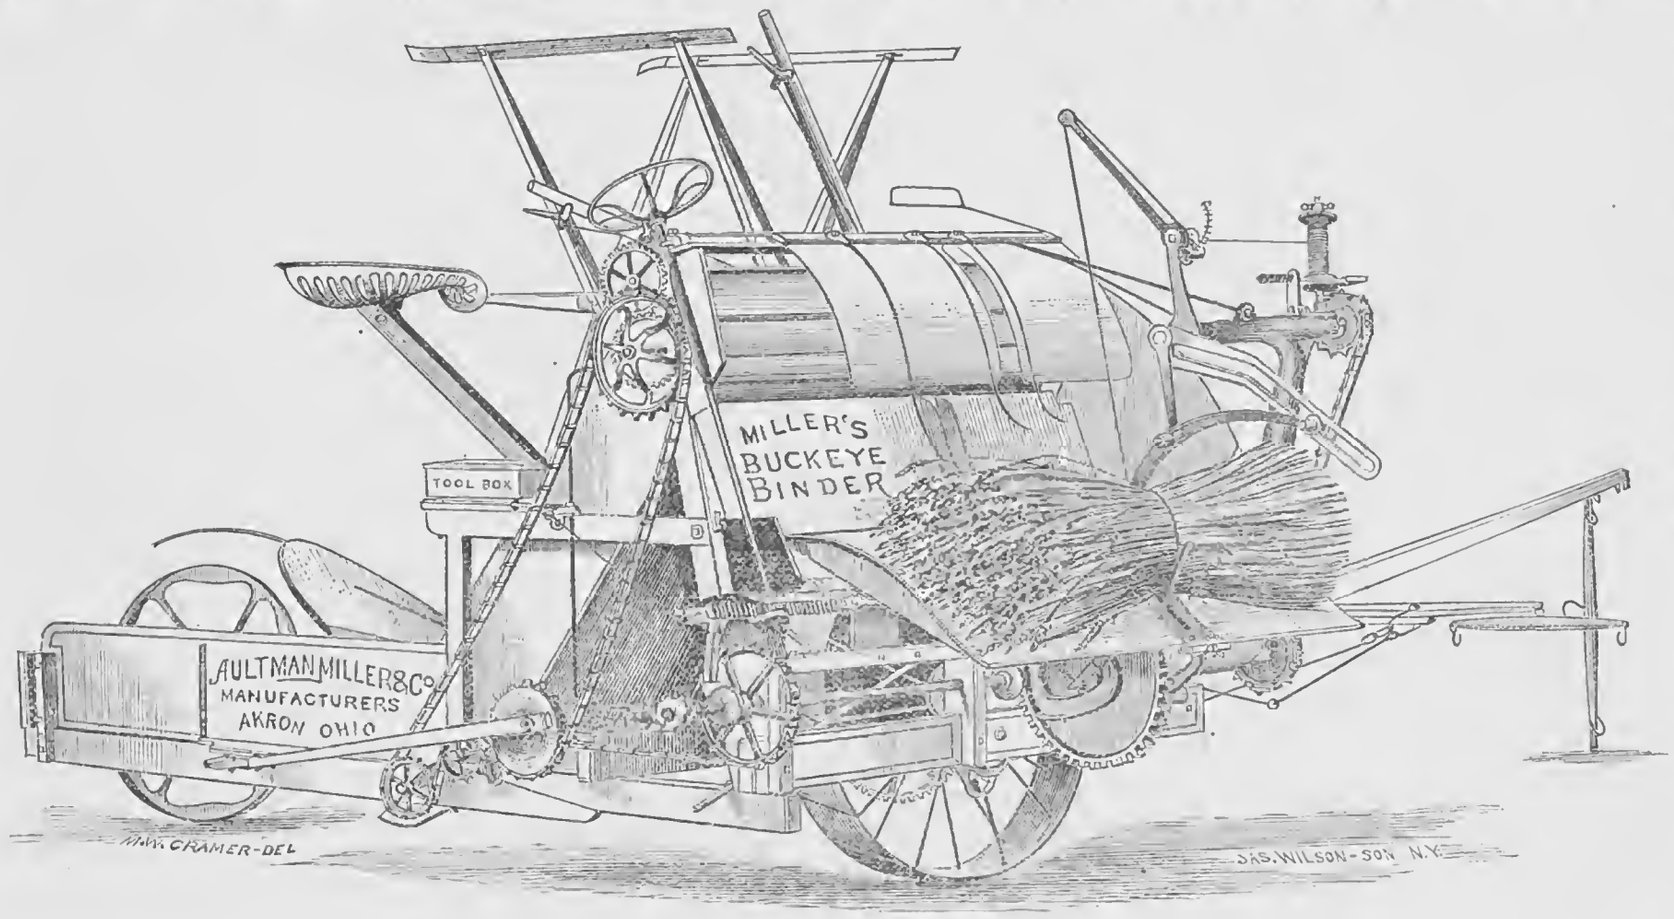
Industrial Implements

MILLER'S BUCKEYE BINDER.

In the large wheat-growing sections of the country the self-binder is a most desirable machine, and is every year coming into more general use. With last year's harvest the Buckeye machines celebrated their twenty-fifth birthday, having been first brought out by their inventor, Mr. Lewis Miller, in 1855. One of Mr. Miller's last and most important introductions has been the Miller Buckeye Self-Binding Harvester, as represented in figure 19. The aim of the manufacturers of this binder (Messrs. Aultman, Miller & Co., Akron, O.) has been to secure, as far as possible, the utmost simplicity. It has been thoroughly tested in the fields, and from the reports we heard from farmers at the fairs last Fall we should say it has stood every test well. It has a simple crank movement for the needle, allowing a stationary arm of cast-iron, tubular in form, to be brought close to the work to be done, giving a rigid support to the needle itself and securing great steadiness of motion.

The driver, without leaving his seat, can instantly move the binding apparatus forward or backward to suit long or short straw. Bundles are delivered regularly at intervals of nine or eleven feet, or by means of a foot-lever the size of the gavel may be regulated at will by the driver, and large or small bundles bound without change of adjustment. When properly adjusted the Buckeye will bind as tightly as may be desired, the limit being not the capacity of the machine, but the strength of the wire. While the cry of the farmer is still for twine binders, they have not as yet been so thoroughly perfected as those that use the wire. Suitable twine has also been hard to get in sufficient quantities to meet the demand, should our country again be favored with another large harvest. Farmers should prepare early and thoroughly to post themselves on labor-saving implements which they will have to buy for the coming season.

BEPPO.



MILLER'S BUCKEYE BINDER.—FIG. 19.

A PROSPEROUS FIRM.—How fortunate it is that no honest, enterprising dealer or manufacturer can benefit himself without at the same time benefiting his customers. His own prosperity depends on his supplying the public with wares of the best design and make at reasonable prices, and in doing this he helps every one who buys his products. There are few firms in the country who have been more successful than the Vermont Farm Machine Company in benefiting themselves and the farming community in this way. Beginning in a comparatively small way at Bellows Falls, Vermont, in 1871, their prosperity has since been steadily increasing, owing to the constant increase of their trade due to the excellence of the goods they manufacture, so that lately they have been enabled to transfer their business to much larger and more convenient quarters. Of their manufactures, the Cooley Creamer has won a first-class reputation, not only in this country, but also in Europe, and wherever the best appliances are used in the dairy; the Davis Swing Churn, without dashers, floats or inside gear, has become popular wherever it has become known; the Eureka Butter Worker has obtained a sale almost as world-wide as that of the Cooley Creamer, while the improved Evaporator is gaining a fine reputation not only for making maple sirup and sugar as well as apple jelly, but also in the growing industry of sorghum sirup and sugar making. LYNX EYE.

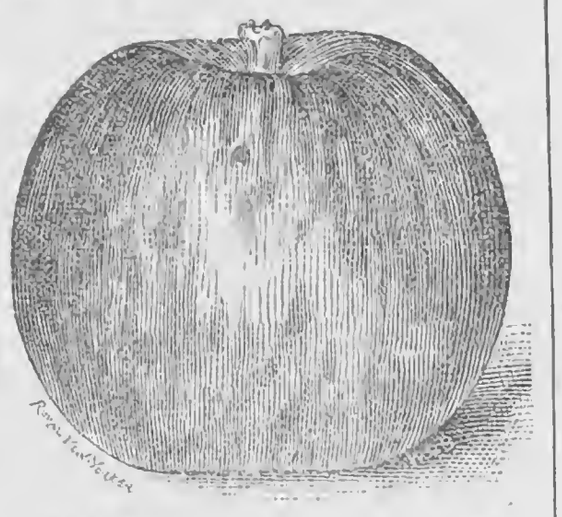
A GOOD REPORT.—The Warrior Mower Co., of Little Falls, N. Y., put 479 machines into the State of Michigan last year. They were all sold and settled for before the first of January. This speaks well for the company, for their machines, and also for the farmers of that State.

Miscellaneous.

RURAL BRIEFLETS.

IT is a great satisfaction for us to receive fresh, sound, native, white grapes at this season. A small box of the Prentiss has been received from Mr. Hubbard, of Fredonia, N. Y. The several bunches which it contained were in a state of almost perfect preservation, and they were as sweet and agreeable as they looked to be. Mr. Woodward, a few days ago, brought us a few of the Niagara which were also well preserved, though, we believe, long-keeping qualities have never been urged as among its merits. "What shall we do with all of our new fine white grapes?" is asked. It will be a good while before we shall have that bridge to cross. During last season we were unable to procure hardy white grapes of any kind except Rebeccas, and they were sold at a high price and scarce at that. "Why don't you get them?" we asked at several grape stands. "Because we can't," was the reply. . . . . .

WE have received a note from one of our most experienced stockmen, and the following extract from it is gratifying to the RURAL NEW-YORKER, and may interest its readers: "Your animal portraits are magnificent as works of art, and all the better because they are true. Now let us see if truth and honesty in animal portraiture will not prevail. It is the breeders who have been inflicting pictorial monstrosities upon the public, but breeders cannot live upon themselves, and must fall back upon the public for support, and the public have been taught by their own good sense that the absurdly foolish pictures of animals, that have heretofore been published could only be considered as suspicious circumstances carrying with them taints of deceit. For if the pictures were deceptive might not the originals be so too? The good sense of sensible breeders, like General Curtis and others, will, however, prevail, and support honest journalism, which rests upon the truth in all things." . . . . . .



SUMMER ROSE APPLE, SHOWING VARIATION IN SIZE. (See page 20.)—FIG. 22.

WE have on several occasions discouraged the use of the immense quantities of manure which are by many thought to be necessary to the production of fine asparagus either in the field or garden. We have referred in support of our view to the immense areas under asparagus cultivation within a few miles of the Rural Farm, that have received no manure for years and we have been unable to learn that they were ever heavily manured. Upon these highland, sandy farms there is no other crop that can be raised with so little labor that returns a larger profit. . . . .

WE have just been reading in the London Chronicle, an account of the mode of cultivating asparagus in the Argenteuil district of France. There the amount of labor given to the crop is prodigious, though it would appear that manure is no more valued there than here in the Long Island asparagus belt. In Argenteuil they are far more careful, also, not to over-cut than we are here. The writer of the account above referred to, says that he saw no sign anywhere about Argenteuil of exhaustion from over-cutting. On the contrary, all the beds and rows seemed to have been cut for the permanent good of the plants rather than the produce. A great deal of the asparagus was *staked*. Each plant was earthed up into a compact little hill—"a foot, 18 inches or more in hight—"around its stems. This was pressed firmly around the plants to prevent the wind from blowing them about as well as to blanch the shoots and "feed the roots of the asparagus." The entire process of culture is carried out by hand, neither hoe, fork nor spade being used. The little mounds are leveled down to the ground in gathering and the young shoots snapped off by a sudden twist of the finger and thumb. . . . . .

THUS the soil is moved twice a year and is as "fine as an ash-heap." Of this fineness the growers are wonderfully proud. They say that the weather and Winter exposure of the soil between the rows sufficiently enrich the soil. . .

Notwithstanding all the labor bestowed upon this mode of cultivation, Argenteuil, it is said, has become rich upon this special industry. . . . . .

It is from this place, spot, district or whatever it may best be called, that we have imported the Argenteuil asparagus seed now offered in the RURAL'S Free Plant and Seed Distribution. About a half ounce will be sent to each subscriber who applies, and we hope that all who thus receive it will follow our directions (to be given before Spring) as to cultivating it. It may prove no better than our own. It may prove in our soil to be essentially the same. But let us give it all needed care, hoping that asparagus culture may thus receive an impetus which its value to the farmer, either for his home or for market, richly entitles it to. . . . . .

A NOTE from Mr. James J. H. Gregory of Marblehead, Mass., to the RURAL reads as follows: "As a friend of Blount's White Prolific Corn, it may please you to know that it is a success in far-off India, just below the Himalaya Mountains, in the Hooloo Valley. A friend residing there writes me that it has done capitally and is an acquisition. I was glad to read your hearty words of commedation of Commissioner Le Duc. I admire his energy and pluck, and as to his enthusiasm, we want oceans of it in that office, with a country of such magnificent possibilities as ours." . . . . . .

THE controversy between Gen. Le Duc Com. of Ag.,) Prof C. V. Riley and the RURAL NEW-YORKER is still fresh in the minds of those of our readers who interested themselves in it. It may be remembered that Prof. Riley expressed himself at the time that he feared the RURAL was prejudiced in favor of Gen Le Duc and that it was not willing to present the case strictly according to its merits. The following extract from a note to the editor will show that Professor Riley must, in the end, have been well satisfied with the impartiality of our course. "I cannot too strongly express my satisfaction at the increasing evidence of prosperity and enterprise which the RURAL NEW-YORKER exhibits."

What Others Say.

WHILE British agriculture is in a transition state, says the Live Stock Journal, would it not be advisable for cottagers to lay to heart the hints we publish now and again, on the advantages of goat keeping? If the depressed Irish farmers, for instance, were to keep goats as they do pigs, they would soon find that the one would, at little cost, assist the other to "pay the rint," and also afford a palatable and nutritious diet to their children. Goats can be kept by people who cannot afford a cow; and if they would only be less short-sighted, our milk supply might be greatly increased, and the health of cottagers' and laborers' children much improved.

DAVID SHAPPEE, of the Elmira Farmers' Club, said that fourteen years ago he helped build a fence, the posts of which were Red-cedar set fifty years before, as he was told by Mr. Bartlett upon whose farm they were standing. They were as good as new when he helped upon the fence. A great many years ago, before he was born, remarked Mr. Hoffman, an old resident of the valley set cedar posts on a farm that afterwards came into his father's possession. Those posts are now supporting a fence, and he believes are good.

UNDER the Veterinarian Department, referring to statements which have been made to the effect that pleuro-pneumonia can be communicated by the virus from inoculation sores, the Mark Lane Express (London) says: "The RURAL NEW-YORKER quotes from the North British Agriculturist to the effect that 'The artificially produced disorder may generate virus which, *it is stated*, may suffice to set up the immodified disease in all its contagious activity.' The italics are our own, and the words so emphasized show that our contemporary does not take the responsibility of the statement. With regard to this matter we can say that no case of pleuro-pneumonia communicated by inoculation has ever yet been authenticated; in fact, the advocates of inoculation do not claim that much, so far as we are aware. As the case stands, pleuro-pneumonia has never yet been proved to be inoculable. Cows have lost their tails, and lost their lives, through inoculation, but not one solitary case has ever yet come to light in which inoculation conveyed the disease, or any modified form of it. It produces an effect on tails, and further up the body sometimes, but it has never yet been known to reach the lungs. How, then, can the pus from an inoculation sore convey pleuro-pneumonia?"

FORCIBLY PUT.—"The only thing certain is that the grain-mining of America must come to an end," says a writer in the London Ag. Gazette. "In England we mine prudently, and our miners strike sometimes so as to retard the too rapid exhaustion of the coal. In America they mine for grain furiously, and the laborers employed have neither struck nor paused for several years. There is no country in the world where the gift of a fertile soil is so fearfully abused. It is very well to say that when the prairie land has lost its store of plant-food in the sod, ordinary farming will begin. That is tall talk indeed, for American grain will come cheap only so long as it can be mined free of the customary charges. When you have to farm for grain you require a population close at hand, and the return to the land of the plant food the crops remove. The American system ravages God's earth, and abandons a fair country to the culpable cupidity of speculators. The rush is still westward, and Yankees say, with wild humor, that if a pioneer went aloft and found in Heaven no western region to make tracks for, he would prefer coming away and prospecting in some other place."

PRUNING TREES AND OTHER PLANTS.—There are persons who assume to believe that pruning plants is at best an unnecessary operation, says the N. Y. Sun. They will tell us that nature does not prune trees; neither does she train them to stakes or trellises, but everything is permitted to grow unrestrained, except as one plant may crowd or overtop its neighbor. It is true that plants do thrive under certain conditions and restrictions without the aid of man, and so does man live without clothes or education, but only in the lowest and most degraded condition. There are few, however, who will claim that the highest development of either physical or mental powers is found among human beings who have never been trained in the arts, or subjected to the influence of civilization. Plants in their wild state require little aid from man to produce natural results. If man could be satisfied with wild grapes, crab pears and apples, we might let the plants grow wild, unpruned and without care, for under such conditions they would produce as much fruit as would be required to supply the demand. If our only apples were those gathered from wild trees, very few would produce fruit enough to supply the demand. But with an improvement in quality there usually comes an increased demand, not only because a superior article is preferred, but because the higher-flavored and more tender the fruit the greater is the consumption without injury to the consumer. The moment a plant is subjected to cultivation it begins an artificial life, and it then requires treatment to correspond with its unnatural surroundings.

CATALOGUES, ETC., RECEIVED.

THE Massachusetts Arms Co., Chicopee Falls, Mass. A beautifully illustrated, descriptive catalogue of the Maynard Breech-loading Firearms. The fine qualities of these firearms are well-known. Those desiring sporting, hunting, target-shooting rifles or shot-guns would lose nothing, certainly, by sending for this catalogue and examining it before purchasing.

ANNOUNCEMENT of Ninth Annual Meeting of the Wisconsin Dairymen's Association, at Waukesha, Wis., Jan. 12, 13, 14, 1881.

FIFTH Report of the Montreal Horticultural Society, and Fruit Growers' Association of the Province of Quebec, for 1879.

AN Illustrated Price List of the Lamb Knitting Machine Co., Chicopee Falls, Mass.

Cherrypeer.

NOTES FROM VIRGINIA.

AFTER 23 years' experience in farm matters in Central New Jersey, the writer has already had three years of like experience in the lower part of Virginia, together with fair opportunities for observation, so that he is in a position to state facts candidly as he observes them.

The climate—which necessarily has a good deal to do with agricultural production,—is here far more agreeable personally and more favorable to vegetation than that of Middle New Jersey. The regular daily breezes of the warmer part of the year temper its heat, and the brief term of cold weather is considerably in favor of a more thorough working of the soil, and a better growth of hardy crops than in the North. The general lay of the land (or its topography) is quite superior to any that I have ever seen in such wide areas, and I have inspected that of all the States on a line from the seaboard at New York City to St. Louis, Mo., and along the whole course of the Ohio River and a part of the lake belt in upper New York, Pennsylvania and Ohio. There are here no swampy districts save along the coast line, and the gently undulating surface of the land makes the natural drainage almost perfect; neither is there any large area too rugged for the convenient use of farm machinery.

The general character of the soil is worthy of especial mention and will bear close and thorough investigation. It is utterly impossible in a hasty trip across the State or through some portion of it to get at anything like a correct conclusion in regard to it; but its river and creek bottoms; its chocolate lands; its sandy basins; its virgin red-clay lands are all really good soils, yet too often a sort of wholesale condemnation is given the farm lands of this State because some of its fields are badly run down from too long cropping with little or no attempt at manuring. When stable manure is spread on the land out of a basket—as I have frequently seen here—it is evident it is putting it on "a little too thin," as the jokers would say. Nor will 100 pounds of ordinary commercial fertilizer per acre do. If the lands of Virginia were treated in the same way in which the New Jersey or the Pennsylvania farmer treats his land, the crops here would prove of excellent character. Already there is some evidence on this point, for here and there some poor, sorry-looking fields have been fairly treated, and now bring forth "some, thirty; some, sixty and some a hundred-fold." A gentleman of Albemarle County this year *without any special effort*, raised 115 bushels of corn from the acre on measured land, while several others, who might be named, obtained fully 100 bushels per acre. It is no very uncommon thing for some bottom lands to yield 75 to 80 bushels of corn per acre, and I have seen some wheat that had measured forty bushels per acre, and was informed of one field that had yielded 42½ bushels. Oats sometimes reach 80 bushels per acre, and I have from the mouths of two credible witnesses that they have made from 65 to 70 cwts. of hay per acre; nor are 300 bushels of round potatoes such a rare yield per acre here as might be supposed.

By this it may be seen that good crops are within the reach of such as choose to treat the land fairly well—the climate and soil are in no way in fault. As for prices of products, I have found them fully as good as at the North, and about 50 to 60 per cent. better than at the West. In fact there are quite a number of products that bring higher prices here than the same kinds do in Essex County, New Jersey, speaking within my personal knowledge.

The cost of farm lands in Southern Virginia, is so very low that any person can very soon earn for himself a farm of good size. Thousands of farms are to-day offered for about what the improvements are worth, or, in other cases, what the wood thereon is worth standing. Thus the land is given away. As a general rule, unimproved land can be purchased at ten dollars per acre in desirable neighborhoods, while most of the farms now offered must be sold at scarcely half that price, on account of the legal pressure to turn them into money so as to get rid of the encumbrances on them. Thousands of acres can be bought at the present time for less than a single crop thereon should clear for an intelligent and skillful worker.

A period of transition is now upon us; the former condition as it existed under slave labor is passing rapidly away, and within a few years these same lands will be held at double and quadruple their present prices. The question is not unfrequently asked why is it that so many Northern settlers here fail, and often lose all they brought with them, get discouraged, and in many cases desire to return or remove to other parts. Let me unfold the secret—the cheapness of the land incites them to buy too large an area. It is very hard for a man who has come here from where land is selling at $150 per acre, or perhaps still more, to restrain himself when he is offered fine-looking land at $10 per acre, or if improved fairly well, at $15. In nine cases out of ten he will overload himself with land, thinking of its prospective increase in value. It has been a surprise to me to see how readily the poor, sorry-looking fields can be restored and how cheaply it can be done. It is no longer a secret that clover, gypsum, lime and ashes will work a complete and desirable change in all these poverty-stricken fields, so that three or four years' time will bring them up to the standard of fair paying crops—say 20 bushels of wheat, or 50 bushels of corn per acre. Some new ideas have to be learned by the newcomer wheresoever he may choose to locate, and yet in no small number of cases do men think they can do the same in the new places as has been their wont in the old. From this cause alone come no small number of failures in farm operations here.

The social condition of farm life in Virginia deserves favorable notice, as do its schools, its churches, its moral sentiment, its law-abiding citizens, its convenient stores, mills, smithshops, railroad stations, Post Offices, etc. Its roads are not altogether what they might be—especially when it is considered that timber is very plentiful, so that streams could be readily bridged if there were a little more public spirit and enterprise. With gravel beds, too, convenient to almost any point, bad places could be made quite passable for loads fully double as heavy as are now customary. Wood and water abound and are of excellent quality for all required purposes. Stone, clay, gravel, marl, coal, iron ore and a dozen other valuable minerals are to be found in abundant supply at points not remote from valuable farm lands.

Do you ask, is it a pasturing county? I answer it is not quite equal to New York, if compared with Orange, Herkimer and Oneida Counties; but, taken as a whole, it will compare favorably in this respect with New Jersey or Pennsylvania. What are its real drawbacks? Want of skill and enterprise; the absence of small land holdings; lack of capital, cattle and sheep; too much hunting; too much of politics; too much of social "imbibing," too much reliance on the colored hands.

Henrico Co., Va. A. F. B.

RURAL SPECIAL REPORTS.

IOWA, Wyoming, Jones Co., Dec. 24.—In this county corn was a little below the average—the dry weather about Midsummer having injured the crop somewhat. The average yield was about 40 bushels per acre on poor farms, while it ran as high as 75 bushels on well cultivated land. Oats, too, were a little below the average; while potatoes were a failure. Fruit was more plentiful than for years, so that a great deal was left to rot on the ground. Wheat was almost a failure, except on a few sheltered patches. Still, quite a large acreage was sown this Fall. A. S. T.

IOWA, Monticello, Jones Co., Dec. 25.—My seeds did very well last season, especially the raspberries, for we had as many as three or four dozen berries from the vines this year, and they were the best berries I ever tasted. Corn did very well this year, but not as well as last. It is worth from 28 to 30 cents; oats from 27 to 28 cents; hay from $6 to $8 per ton. Wheat was an entire failure. A. S. T.

KANSAS, Butler Co., Dec. 26.—Your correspondent, H. L. J., in the issue of Nov. 27th, has struck the key-note to all the suffering in Kansas. His article will be indorsed by nine-tenths of the industrious and intelligent citizens of this State.

I lived here from '72 till '75, when I left the State temporarily, but circumstances detained me elsewhere till this Fall, when I returned, because I had faith in Kansas. I am told by the better class of citizens that they are willing to endure such a season as this just passed, just to get rid of the class of people that have moved out.

There is no starvation, and but little suffering amongst the industrious class. My observation convinces me that the hard times have fallen heaviest upon those who could not get what tobacco and whiskey they wanted!

D. E. S.

MICH., Bear Lake, Manistee Co., Dec. 27.—My Beauty of Hebron potatoes, sent in 1879—through the tribulation of sprouting too much during the Winter, a June frost, drought and beetles—came near being a failure; but last Spring I planted 33 eyes, one eye in a hill, in good, rich sandy loam, and beside them the same amount of Early Rose. They received the same care, were cultivated in the same way and kept equally free from weeds, and the beetles hand-picked every day when necessary till the tubers were ripe. We dug one and a half bushel of the Beauty of Hebron—nice ones too—and a little over two bushels of Early Rose. I think I cut the former into too small pieces, and thus they grew more spindling at first. The cow-peas had grown about a yard high and were in full bloom when a frost came on the 6th of September and laid them low. They were grown on rich soil, as our garden patch was previously a barnyard. The Ovoid Mangels were large and nice, but as our gardening necessarily was later than that of some of your subscribers, I concluded it would not be worth while to strive for the premium. I chanced to receive four Cuthbert Raspberries, but only two of them lived. I hope to see the fruit next Summer. The willows did not grow; they were badly withered when I received them. I put them in water for a few days, but they did not freshen up, and all my care did not prevail upon a single cutting to send forth a single sprout. Two Mauroot seeds sprouted and the plants grew nicely till Autumn, when the tops died. I never disturbed the roots, hoping they would sprout in the Spring after all. Several iris seeds came up and made very fine plants. One hollyhock, of seed sent in 1879, came up and made a very fine plant. Those I sowed last year were destroyed, either by moles or winter-killed. I hope for better success from this root. Last year I sowed my Hibiscus Moscheutos in a box. The plants grew to be about six inches in hight, when I transplanted them into the garden. This year some of them grew about a foot. But last Spring I put out some more seed in very rich soil, and put sash over them, and one of the plants grew to be nearly three feet high, and in September it budded for blossom, but the buds could not mature. Then I have one lot of shrubs of which I do not know the names, as the heavy rain washed the pencil-marks from the wooden label, but I know they are seedlings from the Rural Grounds. There are four plants, measuring from five to six feet in hight, all one season's growth. Some of them must be an inch and a half in diameter at the base. The foliage is very handsome. [This is perhaps Hibiscus militaris, a hardy herbaceous shrub of much beauty.—EDS.] The magnolias have not yet made their appearance. I have some seeds left over of the other varieties to sow next Spring, and may be more successful with them. I had three quarts of Mold's Ennobled Oats; they were sowed in drills on good, rich sandy loam.

Our Winter set in about the 12th of November, and we have had very cold weather for the time of year; the snow is 16 to 18 inches deep, and more coming.

Potatoes, 35 cents per bushel; butter, 25 cents per pound; eggs, 17 cents per dozen.

M. E. A.

MICH., Clinton Co., Dec 24.—We are having steady Winter weather; it is not very cold, however, the mercury being only a little below the freezing point. It has not been lower than 8° below zero here this Winter. That was in November. Wheat does not look very well; it was sown so late that it did not have a chance to get a good start before cold weather set in. The farmers were not in a hurry about sowing on account of the fly. Then there was so much rain they could not get their ground ready. Those beets from the RURAL were a success. M. E. B.

NEB., Papillon, Sarpy Co. Dec. 25.—I have now an orchard of 100 bearing fruit trees and last Spring I planted 2,000 on Arbor Day, 1,100 apple and 900 peach trees, and now I think I must not stop planting. My trees have done very well, considering the very unfavorable season. I do not think I shall lose over 100 of the apple trees. The season has been very dry, and corn in this county has averaged about 40 bushels per acre; wheat, about 10; oats, about 25. The hay crop was very light. Prices are: corn, 23c.; oats, 26c.; wheat, 65@80c.; potatoes, 80c.; butter, 25c.; eggs, 25c. I came to this State 23 years ago and I like the climate better than that of any other State I have lived in. Cold weather commenced this year earlier than at any time in my past experience. The Missouri River closed on the 18th of November, and it has been steadily cold almost every day since. On the advent of cold weather many farmers had not all their potatoes dug, and only a few had their corn gathered on account of scarcity of help.

E. E. S.

N. Y., Elmira, Chemung Co., Dec. 20, 1880. Cold weather has continued with little interruption since Nov. 15th. Very little snow has fallen, and that little disappeared during a few mild days, ending Dec. 6th. Since then the ground has been bare, and the roads as smooth almost as glass, which is favorable for teaming. The greater proportion of the to-

bacco crop of this county is yet hanging on the poles, the weather not having been favorable for taking it down. This is not a pleasant state of affairs for growers who have large crops to handle, and much anxiety is felt by many lest they will be seriously delayed with the work of stripping and sorting their crop. The entire crop of this tobacco-growing section has passed into the hands of buyers at prices ranging all the way from 10 to 14 cents per pound. The crop of this section is estimated at 10,000 cases, or about 4,000,000 pounds. The cold weather has sharpened the appetites of all kinds of stock, which has strengthened the prices of hay and straw, which at present range from $14 to $18 for hay and $6 to $13 for straw. Wheat brings $1.10 to $1.15; corn, 60 to 65c; barley, 70 to 80c; oats, 38 to 40c; butter ranges from 20 to 28c per pound. G. A. G., JR.

S. C.—Aiken, Aiken Co.—Knowing your interest in Doura, I take pleasure in sending you a single stalk, cut from a plant containing seven others of about the same size and length, 14 feet, also a stub from which three cuttings have been made, each averaging three to five feet length. These plants were produced from a single seed, and grown upon land that this year would not produce ten bushels of corn per acre. I just placed a plant upon the scales cut off at the surface: its weight is 26¾ lbs.

If the silo system is a success there is no trouble now to produce and preserve an abundance of cheap, nutritious fodder. As this far excels pearl millet, prickly comfrey, Teosinte, or anything I have seen grow.

It is especially valuable for milch cows, imparting to the butter a deeper color than is produced by feeding upon Indian corn. Have not tested the feeding qualities of the seeds, but believe they will make excellent meal.

S. C. SATTERTHWAIT.

VT., Brandon, Rutland Co., Dec. 26.—Notwithstanding the drought, and the growlers, the past season has been one of unusual prosperity to those who have worked hard and waited patiently for the results. The hay crop, although somewhat smaller than usual in quantity was of fine quality. The oat crop was good. Fruits were rather scarce, in the State generally, but there was an abundance in near localities with easy modes of transportation, so that we have had a liberal supply at moderate cost. Wool and dairy products have brought remunerative prices. Thanks for the RURAL'S Seed Distribution, there is no lack of attractive plants for the Winter, or wholesome vegetables for the cellar. N. B.

WISCONSIN, Elkhorn, Walworth Co., December 26th. In the seed distribution made by the RURAL two years ago, I received among other kinds, seeds of the Rural Acme Tomato. I took the first premium at our county fair, last September, on a dozen of them. They were of such desirable smoothness, size, flavor, etc., as to leave little to be desired farther in the tomato line.

The weevil-eaten pea is so frequently dealt with that I have often thought of giving an opinion on the subject. I know a practical farmer who says that if the peas are kept over a year the weevil dies and the germinating power of the peas remains [Yes, remains *impaired*.—EDS.] No particular experiment was made to show how large a percentage failed to grow, but one year, having an unusual quantity of peas, he stowed them away and the barrel supplied several families with seed for two or three years, and no fault was found with the crop, and the seeds were the kind of peas I understand to be weevil-eaten; that is, they had small holes in them—not every pea, but a goodly proportion of them.

B. C. D.

The Querist.

ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention.]

The Sorghum Sugar Literature.

R. H. Glen, N. Y., asks what works have been published on the manufacture of sirup and sugar from sorghum and corn-stalks.

ANS.—The literature of maize and sorghum sugar manufacture consists of two works, one by F. L. Stewart, Murrysville, Pa., and another by I. A. Hedges, of St. Louis. The first is a modern work which explains very clearly the whole process from the preparation of the soil, the planting and culture of the corn or sugar cane, the harvesting and working of the stalks to the making of the sirup and sugar. The directions given are very plain and leave no difficulties which may not be overcome after a short experience by any intelligent person. This work has special reference to the use of certain materials to be used for clearing the sirup and crystallizing the sugar and which are patented by the author, who alone can supply them. The second treats only of the different varieties of the sorghum and the manufacture of sirup and sugar from them. It refers specially to a process of Mr. Hedges in which a preparation made by him is used for the purpose of clearing and crystallizing the sirup. It also gives plans and descriptions of machinery and buildings required for the manufacture. These two processes are rival methods and it does not seem to be settled as yet which is the better of the two, excepting so far as Mr. Stewart's method includes sweet corn and common maize, as the raw materials, along with the various kinds of sorghum. Good sugar is profitably made by either process. The book is published by the Republic Company, Washington, D. C. Mr. Hedges publishes his book himself. We have just learnt that Mr. Hedges intends to publish in book form his latest experience in the sorghum sugar and sirup industry at an early day. A small but excellent pamphlet on the subject has also been published by Mr. A. J. Russell, Superintendent of the Sorghum Sugar Works at Crystal Lake, Ill.

Green Manuring for Poor Land.

O. M. T., Orland, Ind., asks of what value to poor land it would be to sow corn on it in the Spring, to be plowed in as a fertilizer.

ANS.—The attempt to improve poor land by plowing in green crops is a somewhat delusive business. The effect of the crop plowed in is in proportion to its bulk. If the land is so poor as to be unable to bring a crop, it is hardly possible to get sufficient green matter to plow in with benefit. Green manuring is more useful to keep land in good condition than to restore poor land to fertility. The best thing that can be done is by some means to get the land in clover and plow that in. The most practicable method we can suggest is probably to plow well twice and harrow thoroughly. Then sow buckwheat in May. Plow that down in July and sow again, and plow this under in September and seed down to rye. Plow the rye in in May and plant corn in drills 30 inches apart and three inches apart in the drill. Cultivate well, but don't plow, keeping the ground level. Then plow the corn in, early in August, across the drills, dragging it in with a chain so as to cover well; harrow two or three times to keep the ground loose; finally work over shallow with a cultivator and seed to wheat, and in the Spring seed to clover. This is a good deal of labor and expense, but nothing can come out of nothing, and when a soil is worn out and poor it has to be treated as a sick man who is restored to strength only by a slow process of nursing and feeding. There is but one other alternative, and that costs money; viz., to apply artificial fertilizers and get the ground into grass and clover at once by seeding with Spring rye or alone; then pasture and plow in the sod and repeat the operation. It must be a work of time and patience anyhow.

Sugar from Sorghum and Corn-stalks.

E. N., Outagamie Co., Wis., asks for information about Amber Sugar-cane and its manufacture into sugar and sirup; 1, does the manufacture of the former differ from that of the latter; 2, does it require expensive apparatus to make sugar; 3, is the manufacture of sugar from the cane an assured success; 4, should the juice of the cane be cleaned and purified before boiling into sugar; 5, has anybody been successful in making sugar or sirup from the stalks of sweet or common corn.

ANSWERED BY A. J. RUSSELL.

1. To manufacture sugar from sorghum the treatment must be somewhat different from that for the production of sirup. 2. The most economical sorgo steam train for making sugar will cost about $3,000, with a capacity for working 60 to 70 tons per day of 24 hours. It is not necessary to fit up expensive vacuum-pan works that cost from $10,000 upwards, to make a beautiful commercial sirup and sugar, in paying quantities. 3. The business is an assured success, the best evidence of the fact being the increasing of their capacity by established works. 4. Without a perfect cleansing of the juice before boiling into sirup, nothing can be expected but a rank, unpleasant article, and no sugar that will pay for purging. 5. Sugar has been made from corn-stalks, in small quantities, but those who have tried it on a large scale say that they can make sugar but not in sufficient quantities to pay for manufacturing. The highest price obtained in the Chicago market for the sirup, is 20 cents per gallon.

Catarrh in Sheep.

S. C. M., Rome, Pa., says that for the past year his sheep have been troubled with an excessive discharge at the nose, although they have received excellent care and in other respects appear to be in good condition, and he asks what is the matter with them. They have salt, sulphur and resin, and tar once in a while.

ANS.—The sheep are troubled with catarrh, a very frequent disorder but not serious as long as the lungs are free. The danger is that it may by-and-by involve the lungs if it becomes chronic. The cause may be that the sheep are kept too warm and take cold. Sheep are well jacketed and do not require any more shelter than a dry shed, protected from storms and very well ventilated. A dry, clean yard should be attached, for the coldest nights the sheep will as often lie out in the yard as in the shed if they have dry litter. Give no sulphur or resin. These are dangerous. Sulphur causes too free perspiration from the skin and is weakening, and resin acts too much on the kidneys. A little tar is useful occasionally. Stir the water once a week with a tarry stick and if any sheep are much troubled with nasal discharge rub the tar on the nose and lips so they will lick some of it off. Salt once a week is sufficient.

Creamery and Dairy Butter.

F. McM., Red Bank N. J., asks what is the difference between creamery and dairy butter.

ANS. The difference between creamery and dairy butter is simply that one is made in a "creamery" or butter factory and the other is made in a private dairy. Creamery butter has the better reputation in the market because it is made in large quantities with every modern improved appliance and by the best attainable skill, and comes to market fresh and in the best condition, and in large straight, or even, lots; while dairy butter is in general subject to many disadvantages in the making, and is not always skillfully made, and comes to market in uneven and varying qualities and packages. But there is no reason why dairy butter might not be fully equal to creamery, and, in fact, some dairies are of such superior quality as to be eagerly sought for and taken for special consumption before they can reach the general market.

Miscellaneous.

J. G. K., Port Hope, Ont., says that among 200 grape-vines he planted out last Spring, some were of the Lydia variety; since then, however, this grape has been expunged from the list of the nurseryman from whom he bought the vines; yet as it made by far the strongest growth on his grounds, he asks whether it is likely to fulfill its early promise of excellence. 2, He has a hedge of Honey Locusts which he has cut down to the ground the second year and close back about July 12, and it has a fine, bushy appearance; wishing to plant another of Pyrus Japonica, he asks whether he should treat it in the same way. 3, He inquires which is the best work on the treatment of the gooseberry and the Red and Black Currant.

ANS.—1. The Lydia, which originated with Mr. Carpenter, of Kelly's Island (Lake Erie), was considered years ago a vine of good promise. We tried it for three years at the Rural Grounds, but, as it made a sickly growth, it was then discarded. We had not heard this grape mentioned for years before, and the presumption is that it does not fulfill its early promise. 2. We would advise leaving the plants to grow as they will for two years and then cutting them back in the Spring of the third year. 3. Really, upon this subject there is no better work than a good agricultural journal. We have several times given all the information there is upon such subjects.

E. E. B., Canterbury, Conn., has two plants of the Iris Lævigata six inches high in four-inch pots, and asks, 1, whether they should be treated as house plants during the Winter or put away in the cellar; 2, which is the better breed of poultry for early chicks—Light Brahma or Plymouth Rock; 3, how would the Partridge Cochins do for this purpose; 4, will cranberries thrive on upland.

ANS.—Perhaps it would be better to treat the Iris Lævigata like a geranium this Winter. They should not be watered too much. Plant them out in the Spring after frosts. 2. We prefer the Plymouth Rocks. Partridge Cochins are slow to mature and slow to lay. The breed is a stupid, unprofitable one, according to our experience. 4. We have heard of a few cases where fair crops have been obtained from cranberry plantations on uplands; but, as a rule, they are wholly unprofitable.

J. R. J., McGregor, Ia., asks who offered a premium of $5,000 for the most convenient car for the transportation of stock.

ANS.—The American Humane Association offered a premium of $5,000 for a satisfactory cattle car for the conveyance of live stock, with facilities for feeding and watering. Plans, specifications and models were to be sent in before the 1st of January, 1881. The offices of the association are in New York. The time is now so nearly expired that it would probably be impracticable to get in such detailed description of the car as would entitle it to competition.

C. L. R., Highland, Ills., asks, 1, the proper time for sowing salt on wheat; 2, how much should be sown per acre; 3, on what sort of land will it do most good.

ANS.—1. Early Spring. 2. The amount will depend on the condition of the soil; but about five bushels per acre will not be too much. A trial will be the best way to determine on what soil, it will produce the best effect. Although it has the reputation of increasing the crop by four or five bushels per acre, besides strengthening the straw still, it sometimes produces no effect and occasionally an injurious one.

J. H. Mc., Mifflintown, Pa., asks, 1. whether Clark's root-cutter, sold by the Higganum M'f'g. Co., Higganum, Conn., will clean itself after it has been used, or must it be cleaned out every time so as to leave nothing to freeze up in it; 2, will it cut whole pumpkins as well as roots.

ANS.—The cutter will clean itself so that no pieces are left to freeze. After all the roots needed have been cut, give the wheel a few turns and every piece will drop out. 2 It will cut all pumpkins that are not too large to reach the knives.

W. R. Jeromeville, Ohio, asks 1, at what age a persimmon tree is supposed to bear; 2, what can be done to bring a tree, now ten years old, into bearing. It has bloomed profusely for four years, but borne no fruit.

ANS.—Dig a trench about the roots three feet from the stem; or cut a circle with a sharp spade, severing the roots as deep in the earth as the spade can be thrust. Girdling the branches, as explained in Mr. Chamberlain's article a few months ago, or bending down the branches by weights might also be resorted to.

H. A., Jenisonville, Mich., wishes to know how to raise grape-vines from cuttings; should they be taken from last year's growth or from an older growth.

ANS.—Cuttings may be made of such a length as to include two joints. Well ripened canes of last year's growth should be selected. Set these in mellow ground just so as to leave the uppermost joint out of the ground. Cover with hay or long manure until frosts are over.

W. H. W., Medina, N. Y., asks, 1, which is the best and most prolific Black-cap raspberry for drying; 2, what is a fair yield per acre; 3, how far apart should the plants be set.

ANS. — Would recommend the Mammoth Cluster and Gregg. 2. The Mammoth Cluster will yield from 75 to 100 bushels to the acre. 3 Three feet apart in the row—the rows six feet apart.

C. E. H., Rochester, Minn., says a young fat sheep got its head fast in its manger, and in trying to get out choked itself to death. I hung it up and dressed it immediately and the meat looks as nice as any meat. Is it wholesome?

ANS. — Of course. Disease only makes meat unwholesome. It is better to bleed in killing because the meat is less dark in color.

U. F., Brillion, Wis., asks, 1, whether Silver Chaff wheat is hardy enough to withstand the climate of Northern Wisconsin; 2, where it can be bought?

ANS. 1—Yes, we think it is. 2. We do not know where it can be bought at present. No doubt the catalogues of seedsmen will offer it in time to be sown next season.

R. M. P., Brockport, N. Y., asks whether he can buy half a bushel of Rural Branching Sorghum anywhere at any price.

ANS.—Not that we are aware of. In fact, we are nearly positive that it cannot be obtained.

W. H. B., Union Co., Ia., asks whether he could get grape-vine cuttings from New York or New Jersey wrapped up so that they will grow next Spring, if sent by mail; and if so, when should they be mailed.

ANS —Yes. At any time.

S. G. C., Clinton, N. Y., sends an ear of corn for name.

ANS.—This is the ordinary 8-rowed Yellow Flint of a well-bred strain.

COMMUNICATIONS RECEIVED FOR THE WEEK ENDING SATURDAY, JAN. 1.

Mrs H. L. W., the papers have been sent twice according to our office reports. Shall attend at once.—A. E. B.—G. H. F.—E. L. S.—F. H. S.—J. L (Auburndale) happy to hear from you again.—W. H. T.—J. M. THE
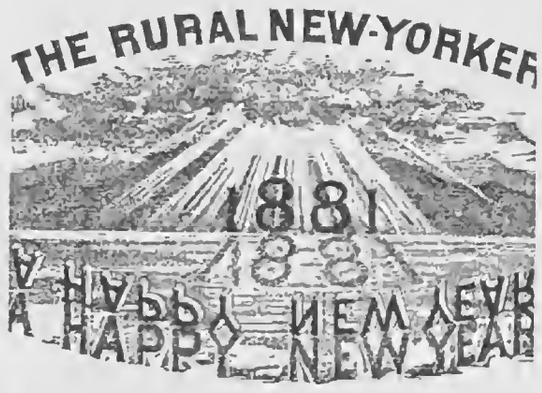
Rural New-Yorker,
PUBLISHED EVERY SATURDAY.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, NEW YORK.

SATURDAY, JAN. 8, 1881.



Two months ago, Mr. Saul, of Washington, D. C., sent us the Japan Persimmon (fruit) which is figured on page 20. It was then about the weight and firmness of a peach of the same size, with a leathery, yellow skin, somewhat like that of red peppers. The skin is now much shriveled—wrinkled—though the flesh is still firm and juicy, but of a puckery, undecided, and not agreeable taste.

THE CRYSTAL WHITE BLACKBERRY.—On page 19 is presented an engraving of the Crystal White Blackberry, the original of which was brought to the RURAL office by Mr. J. T. Lovett. It was laden with fruit (as shown) of a dull white color and of excellent quality. Small-fruit authorities speak of this variety as valuable "only as a curiosity"—but it strikes us that it is not unworthy of better praise. The fruit is not only pleasing to look upon, but, being sweet, why should not it hold as high a place among blackberries as Brinckle's Orange does among raspberries? It originated in Albion, Illinois, and is, we believe, fruitful there in a majority of seasons.

THE ACTION OF BONE FLOUR.—The following letter from Professor S. W. Johnson, is in reply to our question, and explains itself:

THE CONNECTICUT AGRICULTURAL EXPERIMENT STATION.

NEW HAVEN, CT., Dec., 24, 1880.

I don't doubt that bone flour, if *really fine*, will often act promptly and efficiently on corn, applied in May. To do so the conditions must be highly favorable to its decay; that is, the soil must give it high temperature, moisture and the *germs* of decay (bacteria.) In this region about New Haven, it passes as an established maxim that bone does well on low land but not on the hills, that is, as I take it, on moist and not on dry soils.

The action of bone is hastened greatly by a preliminary fermentation, heaping it up, well mixed with its own bulk of loam or saw-dust, under shelter and *moistening* (not soaking) with urine and letting it heat, eight days, until it becomes considerably decomposed.

What ordinarily passes as bone dust is too coarse to have prompt action under ordinary circumstances. Yours, S. W. JOHNSON.

A SPECIAL CALL OF A CHAMPION FAT OX UPON HER MAJESTY QUEEN VICTORIA.—THE Agricultural Gazette informs us that Mr. Colman's prize ox, at the late Fat Cattle Show in London, received the compliment of a special invitation to Windsor Castle to be introduced to Her Majesty the Queen. Another feat of Her Majesty was to walk in the morning, together with the Princess Beatrice, to the farm of the late Prince Consort, some four or five miles from Windsor Castle, to look over the fat stock bred there previous to the commencement of their sale in the afternoon. This is a famous live stock breeding farm, and it was a delight with the late Prince Albert to oversee and direct all its operations; and no one took more pleasure in showing it to his visitors, or was more happy than he in obtaining a prize on the exhibition of any of his animals at the Cattle Shows of England.

THE DEPARTMENT OF AGRICULTURE.

CONCERNING the Department of Agriculture one of two things should be done: either abolish it altogether or else place it on a better financial basis. Not only should the appropriations called for by the Commissioner in his last report, be made at once; but the salary connected with his office should be increased. The office, as it is, offers no pecuniary inducements to men worthy of occupying the position. Those who are well fitted for such a position, find they can make a more profitable use of their time and talent elsewhere, so that men not so well qualified must fill the place. What are we to think of those who now advocate a reduction of the Commissioner's salary! It is an inconsistent and false economy which is so chary of funds for the promotion of great public interests and so lavish with them when mere partisan ends may be subserved. A penny for the advancement of the agricultural interests of the country, and a pound for individual political preferment! A just economy is always commendable; an unwise parsimony, never. If the Department of Agriculture is to be a success and not a failure, men eminently qualified to do efficient work, must be at its head, and such men can be found only when satisfactory inducements are offered.

We hope to hear less about reducing the already too meager salary of the Commissioner of Agriculture.

THE RURAL'S PROSPECTS FOR 1881—THANKS TO OLD FRIENDS.

A FEW weeks ago we suggested to our subscribers that if each would send us another subscriber, our subscription list would be doubled for 1881. The proposition was a self-evident one, and was given out merely to show that though it would prove a great task for any journal having a large circulation, to double it from its own direct efforts, yet it seemed a very simple matter for each subscriber to send us one other subscriber, which would work the same result.

Now whether the RURAL NEW-YORKER has been far better during 1880 than ever before; whether, for other reasons, its readers have grown more attached to it, we cannot say. Certain it is that very many of them have acted upon our suggestion, as if they felt it not only a pleasure, but almost a sense of duty—to comply with the request.

Many others also in renewing, have expressed earnest regret that their efforts to secure other names had failed. Our mails have been so full of such evidences of appreciation and friendship that we have more than once felt our utter helplessness by any means, or words, to express an almost oppressive sense of gratitude which our kind friends are placing us under. It is a relief when one can shake the hand of a friend in response to any kindly act and say, "I thank you." But our friends are far away;—we can not shake their hands:—we can only say that we feel very greatly obliged to them, while regretting that such words so feebly express our sense of indebtedness. Up to the present time, the number of subscriptions received for 1881, is far in advance of any previous year since we have had any connection whatever with this journal. In great part this increase seems to be due to the *efforts of our old subscribers.*

THE CAT IN HISTORY.

A GOOD deal of attention has been given of late years, by students of natural history, to the question of historical distribution of plants and animals, and many points of popular interest have been elucidated by their researches. It has been shown, for example, that while the dog has been a companion of man from the very earliest times, the cat is a comparatively recent addition to the complications of life. Cats were tamed indeed by the Egyptian priests and accorded religious honors and even worship. But the ancient Greeks knew nothing of the domestic cat, although mice were known to them from the highest antiquity. Indeed, mice were at times very troublesome to the Greeks, whole districts being sometimes devastated by them and the people driven away, as they are by grass-hoppers from some places nowadays.

In order to cope in some measure with mice the older Greeks kept weasels or martens, which were tamed for the purpose. The weasel, in particular, occupied somewhat the same place in the world that the cat does now, and numerous fables and proverbs relating to the weasel, which are still current, originated at that period. The old Romans knew no more about cats than the Greeks, and it is only in the fourth century after Christ that mention begins to be made of the cat as a domestic animal. Evidently, it was at this time or perhaps a little earlier, that the domestic cat was distributed throughout Europe and Asia.

It is not a little remarkable, though perfectly natural, that the introduction of the cat gave a new impulse to tales and fears of ghosts and enchantments. The sly, creeping, noctural grimalkin took rank at once with owls and bats and soon surpassed them both as an exponent of all that is weird and supernatural. Entirely new conceptions of witchcraft were gained for the world when the black cat appeared upon the scene with her swollen tail, glistening eye, and unearthly yell.

ENSILAGE.

A GREAT deal is being said in agricultural papers respecting the value of the silo system of preserving green fodder. We have read the statements of a dozen or more who are testing the method and it is but fair to say that their reports are enthusiastically in its favor. The silos preserve the fodder in a partially green state and the ensilage is relished by stock in general. The economy of the sytem, is, however, yet to be ascertained. A silo that will hold 250 to 300 tons of corn ensilage will cost not less than $300 and needs to be, let us say, 40 feet long, 12 wide and 20 deep. The stalks and leaves have then to be finely cut up and so packed in the silos—or pits or cellars as they might better be called—as to exclude the air. Contact with the air at once causes mold, fermentation and decay. The tops of the pits have therefore to be covered with several inches of cut straw upon which planks are laid and heavily weighted. As soon as the silos are opened, exposure necessarily begins so that, unless the amount daily used is considerable, the surface ensilage remaining is unfit for use and must be daily thrown away. We *know* as yet very little as to the actual value of food of this nature for milch cows. That the cost of building pits, of gathering, cutting, and storing the ensilage whether it be clover, Hungarian Grass, cow-pea vines, the Branching Rural Sorghum or whatever other forage plant may be preferred, are formidable items. Probably no farmer that can raise 75 bushels of shelled corn per acre will ever become an enthusiast over ensilage, while those who can raise 30 tons of corn-stalks and leaves and not over 25 bushels of corn per acre may feel the necessity of carefully considering the merits of the "new dispensation." We are not yet willing to advise any of our readers to invest his capital in silos.

A WORD TO NEW SUBSCRIBERS.

MANY (hundreds) of our *new* subscribers write to us: "We have received the first number of your paper but not the seeds—Please send them."

Our new subscribers should "stop a bit", and consider, first, that we cannot send the seeds until we have them to send, and, second, we can not put them up and mail them in a day when they are received. The White Elephant Potato is sent as the weather permits because of necessity it is packed by itself in a little wooden box. The Argenteuil Asparagus seeds have been received from France, and are already put in envelopes. So also are the Washington Oats. The Rural Branching Sorghum is not yet received. Neither may we hope to receive the Dianthus seed in less than one month. The German and French wholesale catalogues for 1881 were received only last week, and from these our orders were made out and forwarded. We beg that our friends interested in flowers will give the Dianthus seeds due care. Fifteen dollars per pound is the *lowest* price paid for the seeds of PICOTEES and CARNATIONS, while the price of a portion of them is not less than $150 *per pound!* Whether they will prove worth the especial care of our readers may be judged from the above statement.

It is necessary, also, that we should remind our new friends that these distributions are *not* premiums. We offer them as, and when, we please, and discontinue them when we please, so long as we repay every obligation to our subscribers. Greatly gratified by the good to agriculture which these distributions of new or rare seeds have wrought, there is no thought to discontinue them so long as we are enabled to procure or to raise kinds which promise to support the good name which our Free Distributions have well earned for themselves. If we had no pride in the matter and put up seeds as *premiums*, we should select popular sorts, such as any seedsman can furnish for five or ten cents per packet.

BREVITIES.

THE RURAL Rebus (p. 6, Corn Number) remains unsolved. It is an easy one, too.

THE St. Louis Cane Growers' meeting will be held the 21st.

DURING the week ending January 1st, turkeys were sold at 12 cents per pound, with a chromo for each turkey.

GEN. LEDUC expects to be present at the meeting of the Minnesota Cane Growers' Association, to be held at Minneapolis on Thursday, the 20th inst.

IN the earlier impressions of the Corn Number the period was left out between the 8 and the 00, making the cost of the special fertilizer used upon the Chester Co. Mammoth $800 instead of $8.00 per acre.

DR. ZABRISKY, a New Jersey physician of long experience and a wide practice, tells us that of all remedies for diptheria he has been most successful with sal-ammoniac (muriate or ammonia). A saturated solution is used as a gargle.

LADY APPLES (Pomme d' api) sold during the holidays for from six to seven dollars per barrel. Half barrels brought $3.50. There seems as yet no apple that can be looked upon as a formidable competitor of the bright-cheeked little Lady.

WHEN our fowls are affected with scaly legs, which are caused by a minute insect, we place the feet and legs in a narrow tin pail of kerosene. This treatment will soon cure the worst cases, if persisted in. The application of ointments and bandages often recommended involves more trouble with no more decisive results.

RURAL GROUNDS, Dec. 30.—Thermometer nine degrees below zero at seven o'clock A. M. Eight inches of snow. Seven o'clock P. M., thermometer one degree below. December 31, seven o'clock A. M., 15 degrees below. January 1, 1881, seven o'clock A. M., 19 degrees below. January 2, seven o'clock P. M., 10 degrees above.

OUR news editor, in speaking of the death of J. J. Mechi, of England, called him *Professor* Mechi. He was simply *Farmer* Mechi—a benevolent soul that loved agriculture as he did his life. A portrait, the original of which—a photograph—was sent to us by Mr. Mechi himself, together with a sketch of his life, appeared in the RURAL NEW-YORKER of Sept. 14, 1878, p. 585.

ONE of the best resolutions the farmer can make for this new year—if it has not already received due attention in past years—is to devote a part of his farm—an acre at least—to small fruits and fruit trees. Determine as to the best kinds to be selected from the catalogues we shall shortly notice, guided by the information which may be gleaned from trustworthy journals and books or friends who can speak from experience. One cannot be too painstaking in selecting *varieties.* Some kinds are suited to your soil and climate—others are not. To select without careful investigation is to throw money and time away.

WE have received the following pleasant note from the Higganum Manufacturing Corporation, Higganum, Conn.:

"We could not believe it possible for a paper to improve as the RURAL has during several years past. It has no equal to-day as an agricultural journal, and every one who reads it can see that live men are at the wheel. As an advertising medium it cannot be beat. We have given it a thorough trial on specialties for the past two years, and for once we can say that we have seen the benefit, for on cider mills and root cutters our trade has been immense, and the orders have come from nearly every State in the Union. If you have any doubting ones, send them to us and we will convince them that they can get two dollars back for every one they will put into advertising in the RURAL. Wishing you a happy and prosperous New Year, we remain,

Yours truly,
CLINTON B. DAVIS, Treas.

ON the night of December 28 a cold spell of extraordinary severity set in all over the country, and next day snow fell from the Rocky Mountains to the Atlantic and from the the lakes to the Gulf. Telegrams of the 29th from the chief cities within this vast area all speak in forcible terms of the intensity of the cold, and mention the fall of snow. In some parts of the country this was so heavy as to block up the roads and railways and prevent or impede travel and transportation, while in other places, as in Galveston, Texas, there were only few feathery flakes. While cold of equal or even greater severity has been by no means uncommon even at this season in nearly every part of the country, it is rarely that weather has been so frigid simultaneously over so extensive an area. Since then telegraphic advices from Alaska to Florida speak of extremely cold weather all over that vast territory: many human deaths from exposure to the arctic cold are reported even from places as far south as Virginia, while a very heavy mortality among stock is announced.

FROM across the Atlantic comes the news that the Great Eastern steamship has been definitely chartered for ten years to carry dead meat to the United Kingdom, from this country and South America. The promoters of the enterprise intend to slaughter the cattle on board the ship as they are received day by day, and for this purpose they are reported to have already secured the services of trained butchers from the Chicago slaughter-houses. It is estimated that from 10,000 to 15,000 carcasses of beef can be shipped each voyage. The meat will be hung in refrigerators and it is calculated that excellent beef from Texas and the Argentine Republic can be landed in the United Kingdom at six cents a pound. If this enterprise shall prove successful it will doubtless find many imitators; the stock interests of this continent will prove still more profitable, and the farmers of the United Kingdom, who have hitherto found consolation in the supposition that they can always bid defiance to competition in foreign meat, will *meet* with a discouraging disappointment.

Literary Miscellany.

THE BABE AT BETHLEHEM.

THE night swept cool o'er Bethlehem's plain
And folded close the distant hill;
Alone the weary shepherds watched
While all their drowsy flocks were still;
Above, the silent stars moved on,
Each in its own majestic way—
Who dreamed the Son of Man had come
And in a Bethlehem manger lay?

No wondrous sign had filled the sky
When sank the flaming sun afar;
No ominous cloud with darkness came
To pale or hide the Eastern star;
No tumult filled the town or inn,
Where travelers tarried on their way,
Unconscious that the Son of God
So near them in a manger lay.

Along the surging streets of Rome,
Through all the Empire of the West,
Nor sign nor sound the hour made known
In which all nations should be blest;
That night Imperial Cæsar slept
On regal couch his cares away,
And dreamed not that the King of Kings
At Bethlehem in a manger lay.

Only where simple shepherds watched
In fields which Ruth of old did glean,
Was the wrapt song of angels heard,
The sudden, mystic glory seen;
And when the heavenly light had ceased,
The heavenly light had passed away
The shepherd entered Bethlehem
And found the place where Jesus lay.

No marvel that they spread abroad
The saying that to them was told—
"Lo, He has come!"—the Christ of God,
The Saviour, promised them of old;
No marvel that, with prayer and praise,
Back to their flocks they took their way;
The Shepherd of their soul had come—
At Bethlehem in a manger lay!

INMATES OF LESTER HALL.

(Continued from page 851.)

CHAPTER XXX.

MEANWHILE Ernest had opened the door of the room where Cecil was and entered softly, so softly indeed that she did not for a moment perceive him, and he had leisure to look at the beautiful wan face lying so wearily on the cushions—at the frail hands, and the dark shadows under the lustrous eyes. In a minute, however, Cecil raised her eyes and saw him, and Ernest coming quickly forward, knelt down beside her and pressed his lips fondly and lingeringly on her forehead, then he drew back a little and scanned her face eagerly.

"You are better, my dearest?" he whispered; "and yet what a wan, white face this is—my snowdrop—my poor pale flower!"

"I have been ill, very ill," she said, faintly. "Ernest, do not pity me; I deserve it all."

He looked at her in intense surprise.

"Yes," she went on firmly, "I deserve it all. I have something to tell you Ernest; sit down there please."

She pointed to a seat a few feet from her sofa, and, surprised and alarmed, Ernest obeyed her, and seated himself in silence.

"Will you be very angry with me?" she said, faintly, pale to her lips, and evidently speaking under the strongest emotion. "Will you ever forgive me, Ernest, for my bad conduct to you?"

"My darling, as if I ever blamed you—as if I had any cause! It was not your fault that you were ill, love."

"It is not that—it is not that," she said, brokenly, hiding her face in her hands.

"What is it, dear?" he said, gently. "Remember, you must not agitate yourself. You must get strong as quickly as possible, you know, and we shall have a quiet wedding, without all that fuss and bother, and I will take you away to some country which has bluer skies and a softer climate than ours. How soon shall you be well enough, Cecil?"

"Ernest," the girl said, suddenly lifting her eyes to his with a woe-begone expression, "I shall never be your wife!"

He started and paled; then, concealing his agitation, he said, calmly:

"Never is a long day, sweet. Dr. Collins assures me that you will be quite well in a few days."

"That will not alter it, Ernest. Oh!"—and she clasped her hands together with a little cry of pain—"will you not understand? Do you not see?"

He started to his feet, his face growing ghastly white, his lips quivering.

"Cecil," he exclaimed, suddenly—"Cecil, you are not going to throw me over?"

There was a moment's dead silence. Cecil had covered her face with one hand and lay still, but trembling in every limb, while her lover stood there before her, looking at her with the same horror-stricken countenance. He was the first to speak. He forced a laugh, and sat down again.

"What a fool I am, Cecil, dear! Forgive me; I was mistaken, was I not? Tell me what you mean darling; I won't startle you again. I don't know what put such an idea into my head."

He drew his chair closer to her, and put out his hand, still a little unsteady. Cecil drew off the diamond ring she wore and put it in his hand in silence.

"Cecil," he said, hoarsely—"Cecil, are you jesting? It is a painful joke, dear; I cannot—I cannot bear it. Oh, great Heaven"—he started to his feet—"I will not believe it!"

"Ernest—Ernest, forgive me," said Cecil, faintly.

He took two or three turns up and down the room in angry perturbation; then he stopped his perambulations and came to her side once more.

"In plain English," he said, calmly, "you mean to jilt me. It is a harsh word, perhaps," he went on, seeing how she shrank and trembled, "but I know no other word that is applicable to these circumstances. May I ask, Miss Lester, what has induced you to change your mind?"

"The fear of inflicting a yet greater wrong upon you," she said, very gently.

"Is that possible?" he said, bitterly, and Cecil shivered at the bitterness in his voice.

"You do well to be angry," she said, sadly. "I have deserved that you should be so, but it is better that I should bear your anger, and you some suffering now, if it will spare you greater pain by-and-by. If I had been braver—if I had not been so selfish in wishing to spare myself suffering, I might have spared you a little. I do not know—Ernest, will you listen while I try to explain—it is so hard—it is so hard?"

He sat down silently. Angry and hurt as he was, something in the girl's face and voice touched him.

"How can I begin?" she said, sorrowfully. "It is all so sad, and I have been so wrong throughout Ernest, when I accepted you, I told you that I did not love you as you loved me, but I did not tell you—I did not tell you"—a hot, painful color rose in her pale cheek—"that—that—I loved some one else."

There was a short, embarrassed silence.

"I see," Ernest said, calmly, but his voice was hoarse and muffled; "and I presume that this gentleman, more fortunate than myself, is to be made happy shortly?"

"I told you that I loved someone else," Cecil said, brokenly; "but I did not tell you that he loved me. Ernest, if I could tell you all, you would not be angry; I think you would be a little sorry."

"I am sorry for myself," he said, bitterly. "Are you not going to marry him?"

"If I were to go down on my knees to him, he would not marry me; he would not love me—now—if I were the only woman extant," she said, with a faint, bitter smile.

"And you love him?" said he, incredulously.

"Heaven help me! yes."

"Cecil," said the young man, after a long pause, "if you are sure—if you have no hope that he will love you—will you not let me have a chance?"

"Would you have me still?" she said, lifting her eyes to his.

"When a man is starving he is thankful for a crust," he said, with a forced laugh. "Cecil"—he fell on his knees by her sofa, and took the little ringless hands in his fond clasp—"you see I love you. I shall only be too happy to have you on any terms."

"Is it yes, my dearest," said he after a pause.

"No a thousand times no," she said, when she could speak. "Do you think I could be so selfish? I hope there is a happier fate in store for you, Ernest, than marriage with a woman who could not return your love. No, do not try to tempt me, dear. You do not know how hard it is, how very hard for me to be firm; but I hope some day that you will bring your wife to see me, and——"

"Never," said Ernest, passionately.

"Never is a long day," Cecil said, smiling—that sad, slow smile of hers, which was so infinitely sad. "Time will tell, Ernest. It would make me so happy, dear."

But Ernest was not so easily pacified, nor would he accept his dismissal. He implored, entreated, stormed in vain. Cecil listened in silence, and with many tears, but she did not yield.

"I cannot do you such a wrong," she said, pitifully, at last. "Be merciful to me, Ernest, I have suffered so much, and I have all my life yet to live and to suffer."

"Merciful! Did you show me any mercy? Did you not buoy me up with hope unto the last? Would any man be patient under such treatment? I am made a laughing-stock to all my acquaintances, and I am expected to acquiesce patiently, and to 'grin and bear it.' The world is not very hard on such sins as yours, I believe," he continued passionately. "It is a woman's privilege to change her mind," with a harsh, jarring laugh, "and the oftener she does so, and the more men's hearts she breaks, the better for her reputation as a *belle*. I am not so lenient as society, Miss Lester: I have a plain word which expresses our conduct. Shall I tell you what it is?—it is perfidy.

"Yes, perfidy," he continued, seeing she did not speak. "Perfidy—a plain, unvarnished, harsh, sounding word, but one which is a true one here if ever it were so."

Proud as Cecil was, she bore his vehement reproaches patiently; she felt that she deserved them—that he had indeed been cruelly treated, and his anger was easier to bear than his sorrow."

"Who is this man?" he said, after a long pause, during which he had been pacing up and down the room like a caged lion, and at the question the hot color rose in Cecil's face.

"You have no right to ask me such a question," she said, passionately. "I have told you that this man can be nothing to me. Had you a spark of generosity, you would spare me such a question as that."

"Generosity!" he said, hotly. "What use is there in talking to a desperate man of generosity? If I had been here, Cecil," clenching his hands vindictively, "I would show you how generous I could be."

"If he were here—even he, although he hates me, would have more pity than you have," panted Cecil. "It is easy to threaten, Mr. Eleston."

"I would to Heaven I could carry the threat into execution!" he said, passionately. "Well, if I were sensible I should be grateful to him, for he has done me a great service—indirectly and unwillingly apparently—but a great service nevertheless."

He turned away from her with these bitter words and left the room, and it was many months ere these two, who should have been man and wife, met again.

That evening he left Thorn Lee, seeing only Mrs. and Mr. Edgar before he left; but as he was taking leave of them, Lottie Tyrrell, in her pretty evening-dress of fleecy blue gauze, came into the hall. Seeing them in earnest conversation, she would have retreated, but Ernest went hastily to her side and took her hands in his.

"Lottie!" he said, unsteadily, "I am going away, and I am glad of this opportunity of saying good-bye to you. It may be many months before we meet again, but I shall not forget how good you were to me the other day. Heaven bless you, dear, and make you very happy."

He bent over her and pressed his lips to the little hand he held, took a hasty leave of his host and hostess, and went away; but the next morning, in detailing his departure to her sister, Mattie mentioned this little circumstance, and the first real smile which had been on Cecil Lester's lips for months played on them as she listened.

"I am so glad," she said, gently. "Lottie is doomed to heal the wounds I inflict. When we were at Mrs. Brayburn's, at Christmas, I thought Dr. Carewe cared for her, but I suppose I was mistaken. Now, if only Ernest would fall in love with her I should be quite happy."

"It is early days yet to think of that," said Mattie, playing with her watch-chain, and suddenly becoming very intent on the setting of one of her rings. "Apropos of Dr. Carewe, did Uncle Henry tell you of his intentions?"

"His intentions?" repeated Cecil hurriedly (Ernest and Lottie Tyrrell both forgotten), "no, what intentions?"

"It is very foolish of him," said Mattie, vehemently. "Uncle Henry is dreadfully cut up about it, and even some of the newspapers have said what a pity it was for such a distinguished man to throw himself away in such a manner."

"What is it? What is he going to do? You have not told me," Cecil said, breathlessly.

"He is going abroad immediately," said Mattie, in a tone of extreme dissatisfaction. "He has volunteered as surgeon in this dreadful Turko-Russian war, and he is to start almost directly for Turkey."

"Oh," said Cecil softly, and that was all.

CHAPTER XXXI.

A NEWSPAPER PARAGRAPH.

THE nine days' wonder of Cecil's broken engagement was long over, and several months had elapsed since that disastrous wedding day which had destroyed all Ernest's hopes, when we find Cecil and her uncle again in the house which Mr. Daton had prepared with so much pleasure for his nieces and of which now he and Cecil are the only occupants, save when Mattie and Edgar come up from Thorn Lee to spend a few days with them. Latterly these visits had been few and far between; indeed, within the last few weeks they had ceased altogether, for Mattie had presented her husband with a "son and heir," and great had been the rejoicings thereat.

Autumn has come again, following its elder brother Summer very quickly; the fire in the dining-room blazes away cheerily, waiting for the young mistress to come down and make tea—Cecil's daily duty—for Mr. Daton, like a sensible man, likes his tea hot, and fresh, and strong, and consequently eschews that beverage when made in the kitchen. The dining-room presents a very comfortable aspect, with its cheerful fire and daintily-appointed breakfast table. Mr. Daton's newspaper is lying ready to his hand, and a pile of letters lie beside his plate, while Cecil, too, has her share of correspondence.

It is very rarely that Mr. Daton's appearance precedes that of his niece, but on that particular morning he comes down first, and has dispatched the greater number of his letters when Cecil enters, rubbing her little hands and smiling as she makes her apologies.

"So sorry, dear uncle," she says, as she stoops and puts her lips softly on his forehead. "I don't know how it is that I'm so late this morning; it shall not happen again."

"It does not matter, dear child," replied her uncle fondly; "I hope I am not quite such a martinet. There is a letter here from Mr. Edgar; he is coming up by an early train and will be here to luncheon."

"Very well, answers Cecil, we shall be glad to see him. I want to see how he bears his new honors."

So saying, Cecil takes up one of her letters, opens it and begins to read; while Mr. Daton, having finished his correspondence, takes up the morning paper and turns to the foreign intelligence.

Eastern Europe is pretty peaceful just now—the dreadful atrocities, the heartrending descriptions of the doings in Turkey, have ceased, and the civilized world is tolerably tranquil *pro tem.*; but Mr. Daton takes a very unusual interest in Eastern Europe, and has done so all through the war, searching the newspaper columns for every scrap of news, and particularly desirous of seeing whether any mention is made of a certain physician, whose departure for the East had been commented upon, and loudly lamented, some months previously. Several times he has seen the name, and always in connection with some deed of mercy and charity, and healing, which had more real courage in it than any feat of "derringdo" which the special correspondent reported; and he and Cecil had read these paragraphs over and over, for although no word of his niece's love for Dr. Carewe had ever passed her lips, Mr. Daton knew that she loved him as well as she did herself.

The six months which have elapsed since we last saw Cecil Lester have made but slight change in her. Her health is completely re-established, for sorrow, thank Heaven! rarely kills, and the girl had struggled bravely with hers, which had not been the less keen because it was self-inflicted; and, although she would carry the wounds until her dying day, Cecil made no moan, and was generally cheerful.

People said that Miss Lester was as beautiful as ever; and although she had lost much of her brilliance, methinks they were not far wrong. She is always pale now, and the lustrous eyes have a look of dreamy sadness in their depths which was not there before; her manner is quieter, more subdued, and she *never flirts now*.

That last, perhaps, is the greatest change of all, and one which surprises many. She is always courteous and gentle, even if a little reserved, and not one of her many admirers can boast of having received any marks of her favor—not one of the many who have laid their hearts at her feet can reproach her with having encourged them in the smallest degree. Nevertheless, cold as she is, and proud as many deem her, Cecil is still very much admired, and she still retains her sovereignty—no one has been able to wrest it from her, for not one has equalled her in beauty and charm.

Many wondered why she did not marry; some said, sneeringly, that she was "waiting for a prince of the blood" at least, and that no other would find favor in her sight; and others, that she was too proud and cold to care for anyone. What would these have said, I wonder, if they knew how often and how tenderly Cecil's thoughts traveled away eastwards, to where Lawrence Carewe was doing his duty so nobly and so bravely? what would they have thought if they had known the many sleepless nights, when her pillows were watered by passionate tears, shed for "what might have been?" Would they have thought her proud and cold, I wonder, if they had known that—for the sake of one man who had given her scorn, who had rejected her proffered love with contumely—to save him one pang she would gladly have laid down her life?

"I have had a letter from little Lottie Tyrrell," says Cecil, smiling, as she begins to pour out tea; "she is delighted with Switzerland—fills four pages with a description of the Rigi and Mont Blanc, and then in two lines of a postscript, which, as usual, contains the most important part of a young lady's letter, tells me that Ernest joined their party at Grenoble and has been with them ever since. You see, uncle Henry, my prophecy will turn out true. Ernest was always fond of Lottie, and she will make a charming little wife for him."

Mr. Daton makes no answer; he is apparently absorbed in his newspaper, which he holds before his face in a manner which looks very much as if he were anxious to hide it from his niece; but the hand which holds it is very unsteady, and Cecil sees that it is trembling.

CHAPTER XXXII.

"Did you hear me, Uncle Henry?" Cecil says. "Why don't you answer? Don't you think it would be a very suitable match?"

"Yes, yes, my dear," answers Mr. Daton, hurriedly, putting down the paper, and desperately attacking the dish before him. "Can I give you some of this, Cecil?"

"No, thank you," she replies, slowly, seeing how his kind old face has grown pale and how his eyes avoid meeting hers. "Have you finished with the paper, Uncle? May I see it?"

There is a moment's silence, during which Mr. Daton looks over helplessly at his niece, and holds the paper tightly in his hand.

"May I see it?" she repeats gently. "Uncle, do not be afraid. I can bear it, whatever it be!"

She rises from her chair, and going over to his side, kneels down beside him, taking the paper gently from his shaking hands. He puts his arm around her in silence, and draws her closer to him, as if by his tenderness he wishes to soften the blow to her.

Cecil smiles, although her eyes are dim, and she turns her cheek confidingly against his shoulder for a moment; then she draws the paper nearer to her, and the eager eyes run rapidly over the columns in search of the name which is so dear to her. They do not seek it long; quickly the paragraph she is searching for is found. Cecil Lester looks at it in helpless silence for a moment, then she turns feebly to her uncle:

"Uncle Henry, read it to me!" she whispers, low. "I cannot—I cannot see it!"

Very low and tremulous is the old man's voice, as he reads. He loves her so dearly, and he knows what these tidings may be to her.

"'It is with the deepest regret'—so runs the paragraph—'that we announce the death of Dr. Lawrence Carewe, whose departure for the East we chronicled some months ago. This gentleman after rendering very great services during the late disastrous Turkish war, had started with a friend on a tour through the Principalities, and after having escaped scot-free through the perilous war campaign, has met a terrible death in the hill country on the other side of the Carpathian range on the borders of Moldavia.

Traveling through a dense forest district with his friend Captain Moray, late of the——Lancers, and their attendants. Dr. Carewe's party was attacked by the hill robbers who infest those parts, and were overpowered after a short and desperate resistance. Dr. Carewe and three of the band were left dead in the forest; the rest were taken prisoners, and but one escaped. This man, after suffering terrible hardships, arrived at the nearest town of Belgrade, where he at once laid the matter in the hands of the authorities, who sent a troop of soldiers to reconnoitre, but without success, and nothing was found but the unfortunate men who had been the prey of the vulture and the kite, and were beyond recognition. The unfortunate gentleman whose sad fate we deplore was in his thirty-fourth year, and had already attained no small degree of eminence in his profession. He was unmarried."

"It may not be true, my darling," said Mr. Daton, tenderly: and although his blue eyes were full of tears, he strove to speak cheerfully. "There may be some mistake.

Cecil shakes her head.

"I have no hope!" she said, in a hollow tone. "He is dead! Oh, Uncle Henry, do you think he knows *now* how much I loved him?"

"My poor, poor child!" said the kindly merchant, brokenly, tears running down his wrinkled cheeks. But Cecil's eyes are dry and burning, and have an expression of intolerable pain.

"It may not be true, my child," says Mr. Daton, tenderly. You know how often—how very often—

such things have happened before, when people who have been reported dead have returned after a time. For my part, I believe—something tells me—that Lawrence Carewe is not dead."

Cecil shakes her head again mournfully, but a shade of color steals into the pale lips as she listens, and a gleam of hope into her heart.

"Can you be patient until Edgar comes? continued Mr. Daton, gently. "You know he has considerable interest in the Foreign Office, and I am sure he will go there at once, and ascertain what ground there is for this assertion, and whether they can give us any hope."

"Uncle," says Cecil, suddenly lifting her eyes to his, "what do you think yourself? Ah! dear, do not try to deceive me. I can bear it better now than if I had hope which turned out to be groundless."

"My child," says Mr. Daton, fondly, "I do not seek to mislead you; I only tell you what I believe myself, and which I hope will prove true."

"Thank you," says Cecil, gently, as she rose from her knees and went back to her seat, ghastly pale still, but calm. She even made a pretence of eating something, to reassure her uncle, who watched her most anxiously; it was but a poor pretence after all, and very soon the forced composure failed her, and she sprang up shuddering from head to foot, and uttering a cry of agony which brought him to her side.

"Oh, uncle, think!" she cried, wildly, "Think what a terrible, awful death; left alone there, perhaps not dead at all! Perhaps after they were gone he awoke to consciousness and found himself alone there, beyond all appeal for help; all hope of assistance, powerless to drive away—oh, great Heaven! it is too terrible. I dare not think of it, or I shall go mad! Oh! what a terrible, lonely death! perhaps he lingered for hours, who can tell?" she went on in her anguish-stricken tones, "perhaps he died of starvation and thirst. Oh, Lawrence! oh, my darling! if it had been possible, how gladly would I have died for thee!"

And then, fortunately, tears come to her relief, and she clings convulsively to her uncle, sobbing passionate, hard sobs, which rend her slender frame and leave her exhausted to faintness.

By-and-by Edgar comes, his handsome, pleasant face very grave, for he, too, has read the account in the train, and he guessed that Cecil would feel it; although he does not know how passionately she had loved him, and loves him still.

As soon as he enters, Cecil springs forward to greet him, her white, haggard face, flashing eyes and parched lips striking him painfully as he takes the little trembling hands in his.

"You will come with us," she says, imploringly. "Edgar, do *you* think it is true?"

"Where do you want me to go, Cecil?" he asks.

"To the Foreign Office," she says, rapidly. "Uncle Henry thinks there is still a chance. Edgar, you will go with us? He cannot be dead!" she cries out, wringing her hands, passionately. "He was so strong—so strong! Oh, Edgar, he was your friend—you loved him. Tell me—have you any hope?" But Mr. Edgar turns away his head without replying. He dare not tell her that he has none, although he is quite willing to go to the Foreign Office and glean what information he can there.

When Cecil comes down ready, both men look at her anxiously, but she is quite calm, and during the drive her composure is perfect. Neither of the two men will quickly forget that half-hour's drive, nor the evident efforts which Cecil makes not to distress them by any emotion.

They will remember for many months how the white, quivering lips try to force a smile, and how little broken sentences escape her now and then; remarks on anything they pass, or on the weather—little questions, the answer to which she does not hear nor heed.

When they stop, both gentlemen get out, and Cecil is left alone; but they have some minutes to wait before they can see Edgar's friend, and her brother-in-law comes back to the carriage to ask Cecil if she will come in and wait.

"It is cold for you, Cecil; you had better come in," he says, persuasively, and Cecil obeys passively. It seems as if she had not strength to resist; and when the under-secretary comes into the room where they are waiting to see him, he does not recognize Cecil Lester, whom he has danced with more than once. When he does so, the smiling, suave manner, so perfectly courteous, changes into gravity, and he does not look at her again while Edgar tells him what they wish to know.

"I will inquire," he says, hesitatingly, and he leaves the room with a troubled face.

"He knows there is no hope," says Cecil, wearily. "He has gone away because he does not like to tell us."

"Perhaps not, dear child," Mr. Daton says, gently, and in a few moments the young man comes back.

"I fear that the sad announcement is but too well authenticated," he says, hurriedly. "There is no reason to doubt its truth. It is a very sad occurrence. We all regretted it greatly, our chief especially, as he was acquainted with Dr. Carewe. I am sorry, truly sorry," he adds, earnestly, "that I can give you no better news."

"Thank you," she says, calmly, but her voice has a hollow, far-away sound, which is strange and painful, and the embryo diplomatist is by no means sorry when the carriage has driven away, although the beautiful, miserable face haunts him still.

"Whoever thought Miss Lester had a heart?" he muses, as he settles himself in his comfortable elbow-seat and resumes the arduous (?) duties of an under-secretary. "I should have as soon expected the statue on the monument to shed tears. Poor girl! how awfully cut up she looked! I suppose she cared for Carewe. Whatever made him go out there? It would surely have been much wiser to have stayed at home, looked after his profession, and married Cecil Lester—if she cared for him."—To be continued.

THE EYE-OPENER.

From several parts of the country come complaints of lightning-rod swindlers, who love most to play their "little games" on our immigrant settlers who cannot understand English writing very well, but in the absence of these, the fellows "try their luck" with others also, in search of a green-horn. Their usual practice is to get the owner of a house or barn to sign a contract nominally for a specified sum, but they either leave a blank which they fill in afterwards with a higher amount, or they so confuse the victim that he signs for a higher sum than he intended; or in some cases they add forgery to their other rascalities and change the figures of the contract. In all cases they make over the note to some one else, generally a confederate, for collection, so as to make it appear that it is in the hands of an innocent party. If they can't get the intended dupe to sign for lightning rods, they are ever ready to swindle him in something else, by getting him to sign a contract for anything from curing a pig to loaning him money. What they are after is his signature, which they are sure to use to his disadvantage. Moral, don't sign anything which you don't *clearly* understand, nor for anybody whose honesty you are not perfectly sure of; and never sign any note or contract for a gadabout stranger.

The post office is doing good work in protecting people from swindlers by excluding from the mail all matter addressed to parties known or believed to be guilty of fraudulent practices. Below is a list of names of parties in this city to whom the Department refuses to pay money orders or deliver registered letters:

Allen, H. D. S.; Ballard, P., 260 Greenwich St.; Baxter & Co., 7 & 11 Wall St.; Bell, Jas., 133 Division St.; Benedict & Co., Bain, John C., *alias* Excelsior M'f'g Co., or The Sheffield Fire-arms Agency; Brooks, Charles D., 128 West St.; Burtnett, H. A.; Cateley, Alfred, *alias* The Family Sewing Machine Co., The Combination Sewing Machine Co. and The Standard Sewing Machine Co.; Clark, M., 50 Delancey St.; Clark & Co, *alias* The Silver Mining Co; Clemmens, M., 1681 First Avenue; Commerford, T. J. N.; Commonwealth Distribution Co. (This concern has a place in Louisville, Ky., also.) Creighton, W. C., *alias* B. H. Porter & Co.; Dayton, John, 1212 Broadway, *alias* R. Field & Co.; Dee, John, *alias* Arnould, Jas., 151 Eldridge St.; Duff, J., & Co., 42 Nassau St.; Duffee, Maurice, *alias* Bell, C. & Co., 1215 Broadway; Elias, Ellis, *alias* Russell & Co.; Emmerson, Jos., & Goss, 180 Broadway and 35 Fulton St.; Evarts, Barnes & Co.; Frenks, A., 151 Eldridge St., Foxwell, Chas, & Co.; George, Jas. W., & Co.

We shall continue this list next week and every week thereafter, besides exposing frauds in other parts of the country also. KEEP the lists and refer to them when you receive an alluring circular or see a tempting advertisement, and *keep your money at least until you see the end of our list of swindlers.*

BRIC-A-BRAC.

AN OLD RAT'S TALE.

He was a rat and she was a rat,
And down in one hole they did dwell
And both were as black as witch's cat
And they loved one an-oth-er well.
He had a tail and she had a tail,
Both long and curling and fine;
And each said, "Yours is the fin-est tail
In the world, ex-cept-ing mine."
He smelt the cheese, and she smelt the cheese,
And they both pro-nounced it good;
And both re-marked it would great-ly add
To the charms of their dai-ly food.
So he ven-tured out, and she ventured out,
And I saw them go with pain;
But what be-fell them I ne-ver can tell,
For they nev-er came back again.

"DE UDDER TICKET."

OLD Uncle Mose, of Galveston, was not noticed near the polls on election day, consequently a colored striker was sent to hunt him up. He was found sitting by the fire, groaning dismally, in his cabin.

"Uncle Mose, has yer voted ylt?" asked the colored rounder.

"No, chile, I wouldn't risk ketchin' a cold in my lungs foah all de money in de world."

"Here's a dollar to pay for your time."

The old man secured the subsidy, remarking, "If you is comin' de bulldoze on dis ole niggah, he weakens. Hev you fetched a kerridge for me?"

"Hit's waiting at the doah, Uncle Mose."

"Is yer gwine to bring me back after ise voted?"

"Bring you right back, Uncle Mose; hurry up, now."

"Gimme a dram foah I starts?"

"Here it is," said the emmissary, producing a flask. "Take a pull?"

He pulled, and asked:

"Gwine to gimme annudder pull when ise done voted?" and then he pulled again.

"Yes, take annudder pull right now, don't be afeared ob it. Dar's plenty moah whar it come from."

So the old man pulled again, and wanted to know:

"Hev yer got annudder dollar bill wid yer?"

"Look heah, ole man, you mus' 'low de campaign committee's made ob money. Here's yer udder dollar. Now jump. De polls is gwine to close."

"Lor, chile, you making out you is a statesman, heah! heah! heah! I'se been foolin' yer. I done voted de udder ticket only dis morning, heah! heah! heah!" and the old image settled down in front of the fire, and nearly chuckled his head off.

"GIVE ME RAGGLES."

A WELL-KNOWN lady artist resident in Rome, relates that while standing one day near the statue of the Apollo Belvidere, she suddenly became aware of the presence of a country-woman. The newcomer, a well-to-do looking American woman introduced herself as Mrs. Raggles, of ——, Missouri, and then asked:

"Is this the Apollo Belvidere?"

Miss H. testified to the identity of the work, and the tourist then said:

"Considered a great statue?"

The interrogated lady replied that it was generally thought to be one of the masterpieces of the world.

"Manly beauty, and all that sort of thing?' said the lady from the land of the setting sun.

"Yes," responded the now amazed artist. "It is said to be one of the noblest representations of the human frame."

"Well," exclaimed Mrs. Raggles, closing her Badeker, and with arms akimbo, taking a last and earnest look at the marble, "I've seen the Apollo Belvidere and I've seen Raggles, and give me Raggles."

For Women.

TED BY MISS RAY CLARK.

KEEPING THE HOLIDAYS.

It is the children's time o' year;
Their faces, radiant with delight,
Fill even the poorest homes with cheer,
And make the happiest still more bright;
The gravest eyes put on a smile,
To watch their pranks and merry ways,
And mark how glad the world is, while
With gifts and laughter, songs and plays,
The children keep the holidays.

But how shall we, whom years have taught
The bitter truths of toil and care,
Whose soberer grown-up hearts are not
Like theirs, as light as Summer air,—
We, who have learned that time beguiles,
That youth departs, that joy decays,
That fortune's frowns outlasts her smiles,
And life deceives and age betrays,
How shall we keep the holidays?

We cannot dance in cap and bells;
We cannot blind ourselves to truth—
For time, the oculist, dispels
The glamour from the eyes of youth;
We know life's cheats and mockery,
And hope's sweet lies and soft delays;
And ghosts which children do not see
Sit at our feasts and haunt our ways,
And help us keep our holidays.

But selfish grief is vain and weak;
Those souls are ever happiest
Which, through this devious journey, seek
Their bliss in making others blest,
If we but shed one helpful gleam
Along the world's bewildering ways,
And make one sad life brighter seem,
More warmly shall our home-fires blaze,
And happier be our holidays.

Ah! he whose tender thought gives heed
To poverty and wretchedness,
Who hears the cry of woe and need,
The plaint of hunger and distress,—
Whose heart with pure compassion burns
For those who walk in thorny ways,
Who dries the mourner's eyes, and turns
The orphans tears to songs of praise,
Most fitly keep the holidays.

BUSINESS FOR GIRLS.

ACCORDING to the recent census, it appears that there are nearly a third more females in our country than males; so, of course, there are not husbands enough to supply the demand. Under this state of affairs there is nothing left for the girls but to change their tactics; instead of spending their time and energies in fascinating the beaux, set themselves to work to earn their own livelihood, independent of the masculine gender. They can do it, too. Let them calmly and decidedly make up their minds that there is an independent work in life for them to do, and that they do not propose to throw themselves as martyrs into the matrimonial market to be disposed of to the highest bi[illegible].

The title of old maid is nothing terrible to bear; simply because now and then a single woman is meddling, tattling and fussy, it is no reason why others should be the same. If any man had made the mistake of marrying her in her younger days, she could probably have shown the same disposition as a wife that spoils her for a maid. Hundreds of women have lived happy, useful lives and died respected and deeply mourned by their circle of friends, who, for some reason, never married, and no one ever thought of ridiculing them because they had not the handle of Mrs. prefixed to their names.

It is all nonsense to be afraid of living a single life. In nine cases out of ten a woman is far happier single than if she had a wedding ring fitted on her finger. Custom is an arbitrary ruler, and because it is the custom for girls to marry, it has come to be a universal conclusion that they must be yoked by the matrimonial fetters just as soon as they are fairly graduated from school. It is not considered whether they are fitted to become wives, to assume the responsibilities of housekeepers; it is just to get married. No wonder that so many sad mistakes occur; not strange that families are broken up, or that two-thirds of the married people get divorces, or wish they could. It is the inevitable result of injudicious matches.

Let a young lady seriously consider all the ins and outings of her coming life, and if she is convinced that she will be just as happy, and as comfortable, to rely upon herself, for future maintenance; then let her choose some vocation that she can follow, and carve out her own fortune.

Many departments are now open for girls, and their services are recognized as equal to men; new paths of employment are continually opening, for hand and brain work; just such employment as girls can do precisely as well as men and they ought to command equal pay. All girls cannot feel able to go out, and carve their way in the bustling world, but for such there is more genial employment at home.

Small fruits will grow and yield as well under ladies care as if a man hoed and pruned them. They will bring in an equal remuneration. Garden vegetables, where one is near market pay well for raising; and the work is not laborious. The care of bees, is another occupation peculiarly adapted to engage the attention of ladies; and since a new hive has been invented that meets the necessities and comforts, of both the industrious worker, and Apiarist, ladies can manage them as well as a man. They can turn their labors into a source of profit; receiving a healthy recreation, and securing an amount of pleasure that no other occupation could give.

If girls have a good comfortable home, it is far better to abide there, if they can find anything to employ their time and energies, than it is to go among strangers and fight their way. As long as they have a mother, to love them; it is well to keep by her, for in no place can purer happiness be found; after she is gone, there will be room enough to buffet the storms of life in the wide world.

A girl can be independent if she chooses, and earn a comfortable living in many ways, and it is not the worst fortune in life, to be born a girl; not half as bad as it is to be married to a man that you can neither respect nor love, and who makes you a perfect slave, to pander to his comfort, and humor his caprices. Think well before you make your choice of business. GRANDMOTHER.

CONCERNING SCRAPS OF SILK AND VELVET.—HOW TO UTILIZE THEM.

MARY WAGER-FISHER.

"I WANT you to send me pieces—mere scraps will do—of your silk frocks. I am making the loviest Japanese silk quilt that ever you saw," wrote Amelia to me a little less than a year ago. I sent her the "Scraps" and ridiculed her for her folly in "piecing" a silk quilt. It seemed such endless business as I thought of the numerous silk quilts I had begun, hardly ever one finished—with hundreds of tiny pieces cut with great exactness, laid smoothly together "over and over." Assuredly, any woman who valued her time must be a fanatic to undertake a task like that.

Not long after, who should make her appearance one fine morning, before breakfast, but Amelia, looking as bright, after a ride of fifteen hundred miles as the morning. One of the first things she did, after her trunk was carried to her room, was to bring me some blocks of her "Japanese" quilt, exclaiming confidently, as she laid them out on the library table: "There! isn't that perfectly beautiful?" I looked, admired and speedily confessed that it was the only sensible method I had ever seen for using up scraps of silk, ribbon and velvet. I was so "taken" with the work, that I very soon began a quilt myself; a long and rather narrow affair, to throw over one when lying on the sofa. I bethought me of a cast-off frock of checked silk that would be just the thing to line it.

To begin a quilt of this sort, you must first decide upon the size of the block that will suit you to work upon, and of which a certain number will make a cover the size you require. It is a good way to prepare the lining first, you can take its dimensions with a tape measure and arrange the size of the blocks. From soft, worn, muslin, cut as many squares or pieces the size of the blocks as you will want of blocks. Cover each block of muslin with one thickness of white, sheet cotton. The blocks are then ready for the silk. Now gather together from all parts of the house, every scrap of silk and velvet that you do not need to use for other purposes; old ribbons, neckties, velvet from old vests, coats and bonnets; all these things will contain in some part a bit that is clean and bright and that will give color to the quilt. Smooth every piece out with a warm iron and put in a large box or basket. In arranging the pieces on the layer of cotton, it will rarely be necessary to cut them, unless they are so large as to cover more than a quarter of a block. You can begin any where on the block to arrange your pieces; the corner is a good place, as you often find a piece of silk in your basket with a right-angled corner that will fit the corner of the block.

But wherever you begin and whatever be the shape of the piece of silk or velvet that you first lay on the cotton, your next selection should be a piece that will fit along one side of it and harmonize with it as to color. Contrast every positive color—red, blue, yellow, green, etc., as well as white, with black, or some dark shade. The arrangement as to color, so as to insure a bright effect in the block, however, must be your own, and your first block will probably *not* be your *best* one. The arrangement of the silk pieces, of different sizes and shapes, may be as "pell mell" as you please. The requisites are, to distribute your colors well and to have your pieces overlap each other enough to admit of being turned under at the edge and sewed down on the adjoining piece. After you have your block covered with the arranged pieces, pin or baste the pieces to the block to hold them in place. You can prepare as many blocks as you like for the sewing, but it is better to finish two or three blocks at first, so as to see how they look, and so as to correct any mistakes in arrangement which you may have made. To hem, "fell" or embroider the pieces down to the block, sewing silk of various shades is required; a box of waste silk such as the shop-keepers sell for twenty-five cents, and weighing an ounce, is convenient to select from, as it often contains six or eight shades of sewing silk. An ounce of embroidery silk in bright colors adds to the beauty of the quilt, for where you have a large piece of plain silk to put on the block, its sameness can be brightened up by crossing it with the embroidery silk in herring bone, "cat" stitch, or any of the "Kensington" stitches. You can ornament it still further by embroidering

figures on it, giving it a brocaded appearance, but this only when you wish to make a very elaborate affair. Silk, velvet, or ribbons with colored edges—nearly all black silk has a colored selvedge—contributes to a better effect. The smaller your pieces are, the prettier will be your quilt, but it is best to use your pieces just as you find them, so there will be no waste, and the chance shapes they are in will produce quite as gay and "Japanese" an effect as any you could cut to order. Of course, when your blocks are done, your quilt is wadded and quilted. You have but to sew the blocks together and fasten the lining to the seams. The quilt may be simply bound around, or a narrow ruffle of "pinked" silk may be sewed in between the cover and lining to finish the edge. This ruffle should be of various colored strips of silk to match the cover.

Scraps of silk may be used in this same way for making covers for sofa pillows, cushions for upholstering chairs and stools, or for ornamenting the border of a curtain for a door. It is good economy to preserve pieces of silk. When once the work is begun, progress is very rapid, as it forms very fascinating employment. A cover of this sort is very nice to spread over an invalid; it is light and warm, and the bright and curious appearance it presents is entertaining and amusing. I see no reason why pieces of worsted and even calico could not be similarly worked up. If one has more time than money, or has little girls who need exercise with the needle and training as to arrangement and color. It is more economical than to cut the pieces into any specified shape; while the sewing of the pieces forms also the quilting, and that is a great item.

DOMESTIC SERVICE.

An impartial observer must often be struck while hearing the frequent complaints made now-a-days against servants, that "that spirit of fair play" so characteristic of Englishmen, is a little lost sight of in their case.

Surely all servants are not bad! There must be some good, bad and indifferent, as there are good, bad and indifferent mistresses.

In the choice of her servants a housekeeper must not be entirely guided by her instinct and the impression she receives at first sight of the person she wishes to engage. A pleasant voice and cheerful face are generally an indication of an obliging disposition.

How can a young mistress be expected to train, or at least direct her servants, when she has herself but a superficial knowledge of housekeeping and servants' work? There is no denying that servants will take every advantage of the laxity of household rems.

It is really past understanding why mothers, who have their children's future happiness so much at heart, should so mistake what is for their real good, and allow them to grow up in ignorance of their most serious duties in life. After leaving school a young girl's time ought to be given up, not as it usually is, in keeping up her "accomplishments," which ought to become from that time but a secondary object—but in acquiring a perfect knowledge of housekeeping, so that she may become in deed, as well as in word, a "true helpmeet."

To resume, then. The best servants are those who have been trained in a large establishment, under an orderly and methodical housekeeper, who is herself responsible for the proper working of the house. This will show, therefore, that if the mistress of an ordinary household is desirous of having good servants, she must be her own housekeeper on a smaller scale. The amount of housework for each servant varies according to their number, and also greatly on the style in which the household lives. In a household of small means a "general servant," which literally means everything useful, is usually employed. The amount of her work depends, of course, upon the kind of situation she occupies; if she be methodical in her habits, does everything in its proper time, keeps everything to its proper use, and puts everything in its proper place, she will greatly lessen her daily labor.

In the household in which there is more than one servant, the cook, if she has much cooking to do, cannot help with the housework; but she has generally to clean the kitchen, scullery, and all downstairs offices, as also the doorsteps, hall, and passages; she is also expected to make her own bed and clean her bedroom.

The housemaid has the care of the sitting-rooms, bedrooms, staircase, and passage; she also washes the breakfast and tea things, cleans the crystal and plate, and answers the door, and waits at table. She should be provided with a closet on the bedroom landing, having hot and cold water taps, hooks for hanging her brooms, etc.; also a number of drawers, in which to keep her dusters, gloves, etc.

The under-nurse has the care of the nurseries, lights the fire, cleans the grates, sweeps and dusts the rooms, makes the beds, has charge of the table, and assists in washing and dressing the children, and helps in the mending.

To discharge her various duties properly should be the aim of every conscientious servant: indeed, it would be but reasonable, if the relations between mistress and servant were based on the mutual accommodation principle, seeing they can not very well do without each other; and a good servant is not often willing to leave a situation where she is well treated, even when tempted by higher wages elsewhere. Therefore, when in the possession of good servants, a mistress will do well to study how to keep them.—Correspondent.

FEMALE FARMING EXTRAORDINARY.

As a case of extraordinary female farming, I send the following and ask can any town, county or state, in the United States beat or equal it? In this township—McCamish—we have a lady, who this season, with the assistance of her little girl alone, has broken the ground, harrowed, planted, and cultivated three times, sixty-five acres of corn—plowed the ground, harrowed twice, and drilled, thirty acres of flax—done all the work of preparing the ground and putting in six acres of millet—harvested, with dropper, eight acres of wheat—plowed, prepared, and sowed the wheat stubble to buckwheat, has plowed the ground, harrowed three times and drilled, forty-five acres of fall wheat, which looks exceedingly well, without a skip, balk or bobble in the drilling—broken ten acres of prairie sod for next springs sowing to flax—put up, 14x14 hills, two hundred neatly built and securely bound shocks of corn-fodder—kept a dairy of ten cows, an apiary of twenty stands of bees, done all of her own housework for a family of three, and kept her house always presentable and in order. She weighs only 98 pounds, and presents a frail and delicate appearance. During the time she has also broken to work and ride, four colts, and written three serials which have been bought, paid for, published and praised by a respectable journal. Her husband—well, he does the dirty work on the farm, clerks at election occasionally, every ten years helps to enumerate the U. S. census, and writes poetry under the sweet sounding *nom de plume* of "Edgerton."

These people are not growing rapidly rich, for unfortunately such is not the reward of farm labor; but they own a good little farm, free from encumbrance, and can look the human race squarely in the face with the happy consciousness "we don't owe you" W. F., Jr.

N. B. It is proper to state that all the above farm work was done on three-horse and other riding implements, except the corn cutting.

Edgerton, Kan. Dec. 7, '80. W. F. Jr.

[The above is a little startling. We are assured the statements are true.—Eds.

CONFEDERATE EXPEDIENTS.

Any one having read a letter headed "How Comfort may be had and the Fashions Followed," and another "Dress Under Difficulties," which was published in a Richmond paper will remember, no doubt, the contrast to have struck them in an almost ludicrous way, as to what is now considered a necessarily decent appearance in society, and what was, during the late war, regarded as an elegant costume. I doubt, however, if the costly fabrics of to-day are worn with half the satisfaction, that the home spun costumes afforded the ladies of the confederacy when the individual taste of the wearer was alone consulted, and they vied with one another in ingenuity of invention.

Some of the ladies plaited their own hats of split oat-straw and made them up with trimmings of straw, really displaying an artistic taste of which they might well be proud. Others developed a turn for manufacturing gaiters and slippers from scraps of black cloth, that was truly wonderful. Some made caps for their sons and brothers of rabbit skins; while the boys busied themselves during the day making candles for them to pursue their various occupations at night. The light given forth by these candles has no doubt injured many eyes, but at that time they were considered luxuries. They were made of beeswax and resin melted together, with a slack-twisted cotton wick drawn through it several times, and wound into a ball of which one end was drawn up and lighted.

A lady of high position at the North, who was living at the South during the war, developed great ingenuity in utilizing the material at hand. She originated the plan of using persimmon seed for buttons; for this idea we gave her great credit as they made quite a pretty finish to a neat calico dress.

Serviceable mats for the table were plaited from soft strips of white corn shucks.

Old scraps of black silk were utilized by cutting them into small squares, picking them up fine and mixing with cotton, which was spun, twisted, and knit into soft and comfortable socks for the gentlemen. Eulalie.

Truth is mighty and has prevailed. See its triumph in Hop Bitters.

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

ONE WEEK FROM MRS. CLAY'S JOURNAL.

ANNIE L. JACK.

Wednesday.—A day in the city! It does one good once in a while to visit the busy thoroughfares and see the bustle and struggle among the citizens for their daily bread, or the wealth they covet. The faces we meet have a preoccupied air, and are often deeply lined as if with care and anxiety. Business is the chief end of man and woman, too, there. You go into a store and they measure you by the length of your purse, or the richness of your dress. How soon these clerks learn to know from whom to expect a purchase! although they are sometimes mistaken, and find the most money belongs to those whose appearance is plainest. I came home thinking of these things and many others to add to our contentment. What a sure, safe way of living is this! The luxuries of the land are ours for the growing, and we have no fear of want that the loss of a situation will cause to the middle classes of a city. We are all the time engaged in the production of articles that every one must buy. Flour and potatoes, vegetables of all sorts, fruit, grain, and cattle, with butter and cheese, are staples that will always command a market, even when people cannot afford new clothes or furniture. Let us be thankful. Then we have constantly around us what is of great value but cannot be found in city streets,—the fresh pure air that greets us as soon as the cars leave those smoky environs.

I think the greatest drawback to country life where there is a growing family, is the isolation. We read of the great singers, lecturers, and other prominent stars who visit the large towns, and in our quiet homes envy the citizen who with all these choice advantages within reach, is often too tired or too careless to attend them. Our provincial towns or villages are too small to attract anything but a circus, or third-rate singers that only fill us with disgust by giving us only the dry husks of what our souls crave, and so we plod on with this unfulfilled desire in our unsatisfied hearts. I have been thinking it would be a good plan to return in the Winter the visits our city friends pay us in Summer. I suppose it is the experience of most of us that as soon as the "Dog Days" come, city cousins arrive as if by a law of nature. They praise our cream, our fruit, our trees and fields, and accept the full benefit of our unwearying attentions. So I shall think it over, and another season try and avail myself of their invitations to "come and see us—do." But I know from past experience what such things are to many a woman who cannot leave home for a night to attend to any of these concerts or lectures, and who feels that this loss deprives country life of half its worth when the long winter evenings come on.

If it will be any help to such I will give the simple experience of one village in which a few of the scattered population determined to have some method of improvement and enjoyment among themselves. The one minister of the place was a young man of thoughtful temperament, whose heart was devoted to his work. With the aid of one or two who possessed advantages in regard to books and magazines, a literary circle was started, where the literature of the day was discussed, lessons given in elocution, and readers appointed to give chosen selections—interspersed with music, vocal and instrumental. The result was that in that village, where the young people had hitherto amused themselves with card playing and small talk, a radical change took place, and all spare thoughts were centred on preparing for the next meeting, or talking over the merits of the last. This can be done in any place where a few are agreed. These thoughts come to mind after a visit to the city, and at no other time does the glow of one's own fireside seem so bright, or home so dear.

TRYING LARD.

Several years ago, we were very glad to call in the assistance of a near and obliging neighbor to help about the "butchering," or, more particularly, about taking off the lard, and trying it out. We were in the habit of soaking it for two or three days, according to the old fashion of our great-grandmother's day. But Mrs. B.—— was an English woman, and had learned something in the way of trying out lard, that at least was new to us; and I will give it for the benefit of others, as it is in the season of butchering. She was very careful not to have the entrails opened, and thus the fat was kept perfectly clean. If by chance an accident happened, the opening was immediately tied with a bit of twine, all "muss" cleared away as quickly as possible, and any particles of fat that had become soiled, were put in a dish to be washed and tried by themselves. The rest was put into a kettle and set upon the stove over a slow fire. Not one drop of water or a pinch of salt was allowed to come in contact with the fat. As soon as it began to fry, it was stirred from the bottom, set into the stove, and allowed to cook as briskly as possible, being occasionally stirred to keep from burning; when done, the lard was drained and squeezed from the scraps, poured into a jar, and when cold covered with a plate or paper, and set away. "This," she said, "will be just as sweet and dry a year from now as it is to-day, if you do not happen to use it all up." We have always followed her fashion of trying lard, and none has ever become rancid, or strong.

Mrs. B.——also showed us how to cure hams, by a plan which we think is far superior to the old way of putting them down in pickle. The hams, shoulders and chops were laid upon a board either in the cellar or some cool room, when the hogs were first cut up; a quarter of saltpeter, and half a pound of brown sugar should be mixed well together, and rubbed thoroughly around the bones; then rub good salt over the meat and let them lay there for two or three weeks, going over them the third day with the sugar and saltpetre preparation, and rubbing on more salt, for they will drain some. If the work has been thoroughly done, they will need no other care than to be turned over occasionally till they are ready for smoking, after which they may be wrapped up and hung away in some cool, dark place, till wanted for use. The meat will be sweet and tender, retaining much more of its natural juices than when the old process of pickling for a month and soaking for another month is the rule. May Maple

DOMESTIC RECIPES.

Vinegar.

Where cider is not obtainable, very good vinegar may be made of molasses and rain water—one gallon of molasses to eleven of the water. Put in some "mother," if to be had. If not, boil *very soft*, a cup of white beans and use instead. Keep in a warm place with the bung open. It will make in a few weeks.

Mother's Johnny-Cake.

One quart of buttermilk, one egg, three tablespoonfuls of butter or drippings, one cupful of sweet apples chopped fine, a teaspoonful of soda, and a little salt. Meal to make of the proper consistency.

Apple-Butter Without Cider.

Stew the apples with a little water till tender, then pass through a sieve and add molasses at the rate of a pint to three pints of the fruit. Return to the fire until thick and smooth, stirring constantly to prevent burning. When nearly done season with nutmeg and cinnamon to taste.

Colorado Pie.

One cup of water, one half-cup of vinegar, one cup of sugar, five tablespoons of flour wet up with a part of the water, a piece of butter the size of a hickory nut. Flavor with nutmeg. May be put in a basin over the fire till it thickens, or be turned at once into the pie. Bake with top crust.

Pork Cake.

One pound of fat salt pork chopped till it resembles lard; one pound of raisins seeded and chopped, one cupful of boiling water poured over the chopped pork, two cups of sugar, one cup of molasses, one teaspoonful of soda, one-half ounce each of nutmeg and cloves, one ounce of cinnamon. Stir in flour till *quite stiff*, and bake slowly.

To Heal an Obstinate Sore.

Apply raw turnip, grated or scraped, changing it as often as it becomes partially dry. This is an excellent remedy.

Mrs. A. E. S.

To Corn Pork.

To eighty pounds of pork (hams, shoulders or sides) take one quart of fine salt and two ounces of saltpeter. Mix with New Orleans molasses to a thin paste. Rub the pork well on the flesh side and on the hock.

Let lie twenty-four hours with drainage, in single layer. Then rub on fine salt all over, as much as will adhere. Let lie two weeks, and then hang up in smoke-house for smoking, or paint twice with liquid smoke.

The above recipe I regard, after several years' use as unequaled. It is convenient, it is a saving of time and labor between the killing and hanging. *It never fails.*

Amos Stouffer.

QUESTIONS ANSWERED.

Yellow Hair, Bronzing.

No. 1, Can gray hair be kept from turning yellow? Will it do to wash it or oil it? The yellow tint does not look well with silver-white hair. No. 2. Can the bronze when worn off from lamps be renewed? Please give directions and obligo, S. N.

Ans.—No. 1, We cannot tell you. If any of our readers have had any experience with gray hair turning yellow, we wish they would please reply. No. 2. Bronzing is generally effected by the action of some substance which combines with and changes the nature of the metal. Not knowing the metal you wish to bronze, we cannot give positive directions. Try the following: wet the metal, which should be free from oil, with a solution of five drops nitric acid in a wine glass of water. When dry, impart to it a gradual and equable heat by which the surface will be darkened in proportion to the heat applied. If this does not prove satisfactory, please state the name of the metal.

Gilding Furniture.

Will some of our friends please give C. W. Wilcox directions for gilding furniture.

Marble Cake.

Will you be so kind as to publish the recipe for marble cake as given in the Rural dated Jan. 20, 1876 or 1877, I have forgotten which? Alfred Wells.

Ans.—"*Light part*—one and one-half cup of white sugar, one-half cup of butter, one-half cup of sweet milk, whites of four eggs, two and one-half cups of flour, one-half teaspoonful of soda and one of cream-of-tartar. Beat the butter and sugar together, mix the cream-of-tartar with the flour and dissolve the soda in the milk. *Dark part*—One cup of brown sugar, one-half cup of molasses, one-half cup of butter, one-half cup of sour milk, yelks of four eggs, two and a half cups of browned flour, one-half teaspoonful of soda, one-half teaspoonful each of ground cloves and cinnamon. When both are prepared, put in the cakepan alternate layers of each, or put them in spots on each other, making what is called leopard cake, until both are used."

Ice water is perfectly harmless and more refreshing with a little Hop Bitters in each draught.

News of the Week.

HOME NEWS.

MONDAY, Jan. 3, 1880.

W. H. HAWKET, M. D., of Helena, Montana, for two years Latin and Greek instructor at Rugby Academy, near Philadelphia, has been tendered the position of private tutor to President-elect Garfield's two oldest sons.....Seven boys, victims of the recent factory fire at Buffalo, N. Y., were buried in one grave, the pall bearers being 28 factory boys.....The Treasury Department has made the transfer of $3,999,500 in gold bullion from the Assay Office in New York to the Philadelphia Mint for coinage into eagles and half eagles. After this transfer there will still remain in the New York Assay Office about $63,000,000 in gold bullion, more than enough to keep the Philadelphia mint employed for six months in coining gold exclusively.....H. D. Cunningham, editor of the Troy (N. Y.) Telegram, has been arrested for criminally libelling Mayor Murphy, of that city, by publishing the statement that the Mayor on Monday attended a dog fight, and owned one of the contestants.....Snow attained to the depth of 2½ feet at The Dalles last week, 3 feet at the Cascades, 10 inches at Walla Walla and Celilo, and 8 inches at Blalocks, Oregon.....Hotels at The Dalles are crowded.

Mayor Adams' foundery and machine shop, at Marshall, Mich., were destroyed by fire on the 28th Loss, $15,000; insured for $4000.....D. W. Halstead's warehouse and B. Jones' meat market at Fort Dodge, Iowa, were burned on the 28th. Loss, $10,000; insurance, $5000 .. ....The President has definitely decided to renew the appointment of Secretary Ramsey as Acting Secretary of the Navy from time to time until the 4th of March..... .. The Ontario Association of Congregational Ministers, at Fairport, N. Y., has cut off from fellowship Rev. Myron Adams, of Plymouth Church, Rochester, for denying the doctrine of endless punishment.....Arthur Langloss, ten years old, ran away from the farm of Patrick Lawler, Manhattan, Ind., because of ill treatment, slept in an open field, had his feet frost-bitten, and yesterday at Chicago both feet were amputated..... Gangs of horse thieves and burglars are operating in the Hudson River Valley and the back country on either shore. Several valuable animals were stolen at New Paltz and other points. Three stores were broken into in Rondout on the 27th In one a safe was removed to the sidewalk to be loaded on a wagon, but the burglars were frightened off without accomplishing their object..... George McGerk was murdered on the 28th by his insane brother, Taylor McGerk, at McGerk's Station, on the Union Pacific Railroad, Moniteau Co., Mo. The homicide had just returned from an insane asylum, at Socorro, New Mexico.

Colonel D. Loder, A. A. G., has started a new military paper at Trenton, called The Jersey Blue, in the interest of National Guardsmen and Comrades of the Grand Army..... Having been tossed about by a succession of screeching gales, Captain O'Neill has just brought into port from Barrow, the ship G. W. Wolff. On the 25th of November the Wolff passed a Norwegian bark with her three topmasts gone by the board, the foreyard with one studding sail on it, all the boats gone, and part of the bulwarks on both sides washed away. The name of the bark was long and could not be deciphered. At the time a gale was blowing and the sea was washing over the deserted ship fore and aft. No signs of life were visible on the tempest-tossed craft..... A few days since an east-bound emigrant train on the Union Pacific Railroad parted in two near Lodge Pole Station, Nebraska, and on the portions striking together again, eight cars were wrecked and five passengers were hurt, but none fatally. .....Ira Fullerton, a young farmer of Roxanna township, Eaton county, Mich., lately surrendered himself to officers, saying he had been assaulted by Gilbert Dutcher, a neighbor, when he disemboweled him with an axe in self-defence.

The icemen of Maine sold 1,000,000 tons of ice last year, and expect to harvest 1,500,000 tons this season. They are already at work on the Penobscot and the Kennebec. It is said that it costs to cut ice on these rivers from 14 to 22 cents a ton, 50 cents to load it on vessels, and about $1.50 to freight it to market.....Eight Philadelphians have died during the year who left property valued at over half a million dollars.....The Ponca chiefs left Washington Dec. 29th, for Carlisle, Pa., to visit the Ponca children at the Indian Industrial School, and will thence proceed directly to their reservation in the Indian Territory..... A special from Fond du Lac, Wis., says: "An elderly woman named Tiffler died here under peculiar circumstances. She was a sufferer from pneumonia for some years, and a warm flat-iron was ordered to be put on her chest. Her husband, a habitual drunkard, applied a heavy iron, which was so hot that it burned through the cavity of her chest, and she died in the greatest agony.

The population of the State of Nebraska, according to the schedules returned to the Census Office, is 452,432. Of this number 249,275 are males and 203,157 females; 355,042 are native and 97,390 foreign-born; 444,805 are white and 2,627 are colored, "Indians not taxed"—that is, Indians in tribal relations under the care of the Government—are not included in the above.....The health of Mrs. W. T. Sherman is quite precarious, and she will not probably be in Washington society this Winter.....The production of whisky in the Cincinnati district in 1880 reached nearly 15,000,000 gallons, on which the government collected a revenue of $12,300,000.....

A new electric signal was placed along the track of the New York, Lake Erie and Western Railroad, 300 or 400 yards from the Jersey City depot, a few days ago.....The Pullman Car Company has an order for a private coach for a Philadelphia millionaire, to cost $30,000. It will be very handsomely appointed and named the "William Penn."....The boot shop of Daddleford & Clark, at Holliston, Mass., was burned on Thursday night. W. O. Hosmer, bootmaker, in the same building, and J. Stewart & Son, sustained small losses.....A fire at Jackson, Mich., recently destroyed the Marion House, a two-story frame building, with four stores on the first floor, and the adjoining brick block, containing the Jackson City Bank and four stores. The books of the bank were saved. Loss, $60,000.....The steamer Plough Boy, en route from Pine Bluff with a cargo of 400 bales of cotton consigned to New Orleans merchants, sank at Pendleton's Landing, fifteen miles below Pine Bluff, Ark., on Thursday evening. The boat was valued at $6000, and is thought to be a total loss.....Mr. Robillard, recently unseated in the Quebec Parliament because of undue influence exerted in his favor by the priests at the general election, has been again elected from Berthier county.....The Pennsylvania Railroad Company has paid to City Solicitor West, $10,626 88, being the amount of the judgment rendered against them by the referee, Joseph B. Townsend, Esq., for the Almshouse land taken some twenty years ago. This money was paid by the City Solicitor to City Treasurer Martin, and thus this long-vexed matter is at last at an end.....Abe Rothschild, tried at Jefferson Texas, for murdering his mistress, has been acquitted.....The fine residence of J. H. Kedzie, at Evanston, Ill., was burned Dec. 31. Loss, $20,000; insured.....H. C. Rogers, farmer, living near Huntsville, Texas, was on Thursday fatally stabbed by one Pickering, who escaped.

The receipts from customs for December will amount to nearly $13,000,000 and from internal revenue to nearly $12,000,000.....J. C. C. Whaley, editor of the Clinton Democrat, and Representative-elect, died at his residence in Lock Haven, Pa., Friday evening.....From time immemorial the Chinese language has found expression on paper in thousands of distinct symbols. Recently an alphabet has been invented, consisting of thirty-three characters, by which all the sounds of the Chinese language can be expressed..... Epes Sargent, who was editor of the Boston Transcript from 1844 to 1853, died in Boston Friday night, aged 67 years. In early life he was connected with the Boston Atlas, and was the author of the "Life of Henry Clay," and also of several well-known plays, and was associated with Park Benjamin in editing the World in New York. In later years he has devoted much labor to works on Spiritualism. During the last two years he edited the "Cyclopædia of British and American Poetry." At different periods of his career he has written several works of fiction and poetry.....There now remain $6,201,000 6s of 1880 (now due) unredeemed, of which amount the Treasury holds $1,083,000 as security for national bank circulation.

Ex-Rev. E. D. Winslow, the Boston forger, now living in Buenos Ayres with a second wife, has offered his Boston wife $15,000 if she will procure a divorce.....An Iowa judge, although 68 years of age, and considered a pretty well educated man, has entered a college in Boston as a student..... Vennor, the weather prophet, used to be a workman in an axe factory at Ballston, N. Y..... The proposition to divide Texas into several States is revived. There is also a movement to cut Missouri into two States.....One of our bicycling Doctors of Divinity is planning a run, with his son, through Scotland, England and Normandy, next Summer.....Hon. E. B. Washburne has been selected to write the article on "Illinois" for the "Encyclopædia Britannica," and Hon. James F. Wilson that upon "Iowa."....Governor-elect Porter, of Indiana, will be married in New York, on the 5th of January, to Miss Stone..... A liquor dealer in Norwich, Conn., on being prosecuted for selling liquor illegally, said to the prosecuting agent: "You did not send your officers to my place any too quick. It is a miserable business. You came just in time to save me. I am obliged to you."....The Judge Advocate-General has been directed to prefer charges and specifications for the trial of Cadet Whittaker. The court-martial will probably meet in New York city. It is said the President and Secretary of War are both of the opinion that it will be better to have the trial at some other place than West Point, where the influences are adverse to Whittaker.

At Newark, N. J., Edward Kissam, colored, beat his wife to death Christmas day with a club, and afterward put the corpse in bed and slept beside it all night. The couple had been drinking freely with friends, and, it is supposed, the murder was committed during a quarrel. Kissam was arrested. He denies his guilt.....At Hempstead, L. I., Sidney Hendrickson, a prominent farmer, who has been feeding live stock on the refuse of New York hotels and boarding-houses, and selling meat to unscrupulous butchers, pleaded guilty and was fined. The case excited great interest. A number of Hendrickson's cattle were lately seized by the authorities and killed.....Mrs. Mary Hardy is lecturing around the country in regard to young women, and she tells mothers to beware of the young man who drives a fast horse.....Mrs. Jessie Grant has left a most agreeable impression in Washington. She is a slender, willowy blonde, young and pretty, with high, clear-cut features, a pleasing voice, and winning manners.....Rev. James Hartnett preached a sermon at Davidville, Ark., on the duty of paying debts promptly. "So much for sentiment," he said, finally, "and the hard fact is that this church owes me five hundred dollars, and I shall never occupy this pulpit again until it is paid."

FOREIGN NEWS.

In Ireland the trial of the leaders of the Land League for conspiracy against the good order of the island—though nominally against the government—has begun. There is evidently a determination on part of the government to secure a conviction, although there is little display of the vindictive bitterness that has hitherto always marked political trials in the "Islands of Saints." The defendants appear resolved to make of the trial an occasion of proving to the world the gross abuses and intolerable grievances which have led to their action and the formation of the League. To this end they intend to summon oppressed tenant farmers and others from all parts of the island, to the number of 1,000, so as to obtain their sworn testimony of the hardships to which they and their class have been subjected. Prominent statesmen, such as John Bright and Gladstone himself, will, it is said, be subpœned to testify with regard to speeches favorable to Ireland, which they have delivered. The object will be to obtain, under oath, their real opinions of the Irish Question, as it is thought that they really believe the tenants were grievously oppressed. Meanwhile military preparations have been made so that a number of "flying columns" are ready to start at a moment's notice through the island in the event of an outbreak in any part of it. It is noticeable that among all the troops now in the country there is not a single Irish regiment. The Land Leaguers are still holding mass meetings all over the country, which are numerously attended except in Protestant Ulster. Even there many of the tenant farmers are joining the League, though the rest of the Orange population are bitterly opposed to it. The system of "Boycotting" is spreading, and is now applied to storekeepers, lawyers and to all who are obnoxious to the League. At the approaching meeting of Parliament the Government intend to introduce at the same time measures of coercion and relief.

[La Fayette Daily Journal.]

Anxious to Rise.

There's plenty of room upstairs, as Daniel Webster said to the young lawyer anxious to rise, but despondent of his chance to do so; but no one need injure himself either in climbing the stairs of fame or those of his own house or business place. The following is to the point: Mr. John A. Hutchinson, Supt. Downer's Kerosene Oil Works, Boston, Mass., writes: "Mr. Patton, one of our foremen, in walking up stairs last week sprained his leg badly. I gave him a bottle of St. Jacobs Oil to try. He used it and an almost instantaneous cure was effected."

AGRICULTURAL NEWS.

No official statistics of crops are collected in Russia, so that a great deal of uncertainty always prevails about the results of the harvest until the crops are actually marketed. Speculators seem this year to have taken advantage of this uncertainty, and grossly exaggerated the partial failure of the harvest in some districts; and it must be acknowledged that all official and other information from different parts of the empire also conveyed a gloomy view of the outlook. This was still further darkened by the almost entire cessation of exports of grain in the late Fall and early Winter. Later on, however, reports of the wheat crop became far more favorable, and exports began to resume their old-time magnitude. On Dec. the 9th, the following amount of wheat was afloat from Russian ports to the United Kingdom. From Azow, 608,000 bushels; from Odessa, 240,000; from Nicholaieff, 272,000, total, 1,120,000. At the same date the quantity on passage thither from the American Atlantic ports was 2,433,000 bushels, so that at the beginning of December Russia was contributing to the United Kindom nearly half as much wheat as all the Atlantic ports of the North American Continent. This doubtless has been the chief cause of the present depression in prices of wheat here.

The visible supply of grain, comprising the stocks in granary at the principal points of accumulation at lake and seaboard ports, and on rail from Western lake and river ports, and frozen in on New York canals, is:

	1880. Dec. 25. bush.	1880. Dec. 18. bush.	1879. Dec. 27. bush.	1878. Dec. 28. bush.
Wheat	30,007,418	29,709,288	28,634,366	18,283,701
Corn	16,921,123	16,465,295	10,175,216	8,525,819
Oats	3,859,694	3,783,061	2,795,105	2,700,310
Barley	3,183,241	3,057,731	4,529,297	5,248,452
Rye	873,360	940,916	1,091,333	1,732,955
Total	54,846,836	53,956,291	47,225,317	36,481,237

It will thus be seen that of late a great deal of grain has been thrown upon the market. Until a few weeks ago the visible supply was considerably greater last year than this, whereas now the case is reversed.

The tea crop of India this year is estimated at 700,000,000 pounds, nearly double the yield of 1878. Ten years ago it was only 14,000,000 pounds..... .....Mr. Vennor predicts the following for the month of January, 1881: "As will have been seen from the forecast of December, I anticipate that New Year's callers will have heavy sleighing this year from Montreal to Washington, D. C., and that a cold snap during the first quarter of this month will preserve it for that period. I expect blockades of snow in the United States on the 7th and 8th of January, and rainy days during the month will be exceedingly few. The second quarter will open with heavy snow-falls and terminate in a cold snap. The middle of the month will bring snow-falls which will terminate in milder weather toward the end of the third quarter. This thaw, which will be interrupted by a brief cold spell, will extend from about the 18th of the month into February. The record of this month will show it will have been a severe one, and the general conditions of the weather will probably remind us of what are called 'real old-fashioned Winters.'".... ....It is stated that the Government Signal Service, through its multitude of stations has carefully tested Vennor's weather forecasts, and found that they are no more correct than good guesses. The country is so extensive that whatever kind of weather may be predicted in a general way is pretty sure to occur in one part or another of the Union.

THE receipts of cattle in Buffalo have increased from 388,057 in 1870 to 789,854 in 1880. The shipments over the Canadian roads have entirely recovered since the repeal of the prohibitory order. The total receipts in Buffalo of all kinds of animals, except horses, show a marked increase..... .....A telegram from Charleston, S. C., on Dec. 27, says:—Mr. Le Duc, Commissioner of Agriculture, is here, and has completed arrangements for the establishment of an experimental tea farm. The location selected is twenty miles from Charleston and two miles from Summerville, on the line of the South Carolina Railroad.....A cablegram from England on Dec. 29 says:—Official returns show that the foot-and-mouth disease is seriously spreading amongst the cattle in all the large counties of England. There are 5,754 cases of the disease reported in Norfolk and 2,736 in London... ....Ed. Richardson, the "cotton king" of America, is a member of the New Orleans firm of Richardson & May, cotton factors, and is said to be worth $15,000,000. He owns 10 or 12 plantations, and makes 15,000 or 20,000 bales a year. He is also a partner of Richardson & Oliver, who run the Mississippi Mills at Wesson, Miss., employing a capital of $600,000 and 800 hands, and running 400 looms and 18,000 spindles. The mills turn out both woolen and cotton goods, using up 18 and 20 bales of cotton and 3,500 pounds of wool daily, but so great is the demand for the goods in all the principal cities of the country that a Brush electric light and two sets of hands are employed to keep the mills running day and night. There is not a grog-shop in Wesson.

Twenty Years a Sufferer.

DR. R. V. PIERCE:

Dear Sir—Twenty years ago I was shipwrecked on the Atlantic Ocean, and the cold and exposure caused a large abscess to form on each leg, which kept continually discharging. After spending hundreds of dollars, with no benefit, I was persuaded to try your Golden Medical Discovery, and now, in less than three months after taking the first bottle, I am thankful to say I am completely cured, and for the first time in ten years can put my left heel to the ground.

I am, sir, yours respectfully,
WILLIAM RYDER,
87 Jefferson Street, Buffalo, N. Y.

LYDIA E. PINKHAM'S VEGETABLE COMPOUND has rapidly made its way to favor among druggists, who have observed its effects on the health of their customers, Send to Mrs. Lydia E. Pinkham, 233 Western Avenue, Lynn, Mass., for pamphlets.

GEORGE ELIOT'S ROMOLA.

A TIMELY interest is given, by the death of the author, to the new edition of her masterpiece, "Romola," just issued by the American Book Exchange, New York. It shows her work at its best and strongest, and at the same time gives the reader the opportunity to acquire a lasting familiarity with the scenes and society of mediæval Italy. It is one of the few really great historical novels of the world. It is issued in handy and beautiful form, extra cloth binding, simple but rare elegance and taste in design, and like the other issues of the "Literary Revolution" its cost is almost nominal, viz., 35 cents. It is one of a series intended to form a library of classic fiction, which will include one representative and characteristic work of each of the great authors who have won lasting fame in the realm of fiction. Life is too short and too full of work to permit the reading of *all* that is beautiful and valuable in these creations of the imagination, but even very busy people can find time to read *one* book by each of the score of authors who have won immortal fame and place in the affections of the people. Not to be acquainted with them is to be ignorant of much that is most important and most interesting in the history of nations and of men. Not to possess them is to be deprived of most fruitful and profitable sources of enjoyment. Among those issued or nearly ready are: Scott's "Ivanhoe," Bulwer's "Pompeii," Irving's "Knickerbocker," Cooper's "Mohicans," "Tom Brown at Rugby," "Adventures of Don Quixote" and "Uarda, a Romance of Ancient Egypt." Full catalogue of standard publications will be sent on request, by the American Book Exchange, Tribune Building, New York.

AN EXCELLENT PREMIUM.—Those of our agents who are in want of a good cook stove should examine into the merits of the one we offer as a premium for this year. It has an oven 19x20 inches, and has a full set of trimmings as follows: 1 wash boiler, 1 coffee boiler, 1 steamer and cover, 1 pot cover, 1 iron or tin tea-kettle, 1 set (4) bake pans, 1 joint pipe, 1 pot, 1 kettle, 2 skillets or spiders, 1 iron heater, 2 cake griddles—all securely packed and delivered F. O. B. at any steamboat or at any depot in St. Louis. This stove can be used with either hard or soft coal. We give this valuable premium for 44 subscribers. Circulars giving full description of it will be furnished to those who desire them, by addressing the manufacturers, the Excelsior Manufacturing Co., St. Louis, Mo.

All your own fault if you remain sick when you can get Hop Bitters that never fail.

To Housekeepers.—The attention of heads of families is respectfuly invited to the superior quality of BURNETT'S FLAVORING EXTRACTS. They are entirely free from the poisonous oils and acids which enter into the composition of many of the factitious fruits flavors now in the market. They are highly concentrated, have all the freshness and delicacy of the fruits from which they are prepared, and are less expensive.

The Markets.

SPECIAL FROM THE CHIEF CENTRES.

Until Saturday, Jan. 2.

Boston.— POTATOES—There is no change. A moderate trade at 45c. for Chenangoes, 55@60c. for Prollifics, 60@65c. for Northern Rose and choice eastern, including Houlton stock, sell for 65@70c. Native red onions sell at $3.50, and yellow at $4@4.25 ℔ bush. The market is firm for good apples at $1.50 ℔ bbl., and some fancy lots sell up to $1.75. Cranberries—Market remains dull at $4@5 for country and $5@6.50 for Cape. BUTTER—Freshly made Northern and Western Creameries sell at 30@33c. for choice, and summer made at 27@29c. Choice lots of fall New York and Vermont dairy butter sell at 26@28c. Choice freshly made Western or Northern dairy butter, that is all right in color and flavor, is in fair demand at 24@27c.; freshly made ladle packed sells at 22@24c., and summer made ladle at 15@18c as to quality. CHEESE—Northern factory, fine, 12½@13c. per lb.; Western factory, fine, 12½c; fair to good, 11@12c per lb; common, 8@10c per lb. HAY AND STRAW—Northern and Eastern prime, $23@24 per ton; Northern and Eastern medium, $20@22; Swale, $13@14c; Straw—rye, $28@25 per ton; oat, $13@14.

Chicago.—Wheat unsettled; No. 2 red Winter, 94c; No. 2 Chicago Spring, 96½c. cash; 96½c, January; 97½c bid, February; sales at 95@97½c, February. Corn dull and weak: 36½c, cash; 36½c, January; 37½, February; 41½c bid, May; 41½c. June. Oats unsettled; 30c, cash; 30½c. January; 30½c, February; 35c asked, May. Rye firm at 83c. Barley firm but not quotably higher at $1.07. PORK—Active, firm, and higher; new, $12.60, cash. $12.52½@12.55, January; $12 72½@12.75, February; $12 90@12 93½, March. Lard unsettled, but generally higher; $8.45@8.47½, January; $8.60@8.62½ February; $8.72½@8.75, March. Bulk meats stronger; shoulders, $4.15; short rib, $5.65; short clear, $6.90. BUTTER—Choice to fancy creamery 31@32c per lb.; fair to good do. 28@30c; fine to fancy dairy, 24@26c; good to choice dairy, 21@23c; medium to fair dairy, in shipping lots, 16@18c; ladle packed, good to choice, 17@18c; fair to the best packing stock 12½@14c; grease butter, 8@10c. fair to choice roll butter sells at 15@17c. CHEESE—Good to fine cheddar creams at 11@12c per lb, and do flat skins, at 7@8c, while the poorer lots have to be heavily shaded, and the refuse will not sell at all. WOOL—There was about the usual inquiry for this season of the year on mail-order account, and prices were steady as previously gived. For assorted lots from store we quote Eastern Iowa, Wisconsin and Illinois wools as follows: Tub-washed, bright, 46@47c per lb; do dingy and coarse, 41@43c; fleece-washed medium, 43@45c; do fine, 39@40c; do coarse, 35@38c; unwashed medium, 32@31c; do coarse, 25@27c; do fine bright, 26@28c; do heavy, 18@25c. Bucks' fleece, 16@18c. Consignments from Western Iowa, Nebraska and Kansas sell about 2@5c per lb. less than this range and burry and poor conditioned lots at 3@10c less. New Mexico wool (unassorted) is quoted at 22@25c per lb, for medium to fine; coarse to medium, 18@22c, and black at 19@22c.

Cincinnati.—WHEAT scarce and firm; No. 2 Red Winter, $1.03. CORN quiet; No. 2 Mixed, 42½@43c. OATS weak; No. 2 Mixed, 35@38c. RYE strong; No. 2, 95½@96c. Barley strong; No. 2 Fall, 95c@97c. PORK firm at $13 50. Lard strong at $8 45@$8 50. Bulk-meats quiet but firm; Shoulders 4½c; Clear Rib, 6¾c. Bacon quiet but firm; Clear Rib, 7¾c. BUTTER dull and nominal; choice Western Reserve, 22@23c; choice Central Ohio, 18@20c. Hogs firm; common, $3 90@4 30; light, $4 35@4 60; packing, $4 60@4 90; butchers', $4 90@5. HAY—Common sells at $14@15, prime do. at $16@16 50 ℔ ton, and prairie hay at $11@12 per ton, in bales on arrival. Wheat and rye straw are firm at $9, and Oats straw firm at $10. HIDES—There is little demand, and prices are fully ½c ℔ lb lower for green and wet salted Hides. Green Hides bring 7@8c, green salted 8½@9c, dry salted 13@14c, and dry flint 15@17c ℔ lb. Sheep pelts sell at $1@1 60 for prime to choice wool, and 25@50c for sheared. Damaged hides one-quarter to one-third less.

St. Louis, Mo.—WHEAT: trading light; No. 2 Red Fall, 96½c.@97½c. cash; 96½c.@97½c., January; $1.01 bid, February; $1.01½@1.03½, March; $1.05@$1.06, May; No. 3 do., 94½c.; No. 4 do., 87½c. bid. CORN market slow; 37@37½c., cash; 37½@37½c., December; 37½@38¾c., January; 40c. April; 40¾@41½c., May. OATS dull; 29½c., cash; 30c.; January; 31½c. February. RYE dull; 52c. bid. HOGS active; light $4 20@4 40; mixed packing $4 30@4 60; butchers' to fancy $4 65@4 80. CATTLE—firm with a good demand; exports, $5.25@5.75; good to choice shipping, $4.75@5.25; fair to good $4 40@4.75; light, $4@4.30; good butchers' steers $3.50@4.25; good to choice cows $3@4; good to choice heifers $3.25@4.25; fair to good colorado steers $4.75@4 25. SHEEP strong, scarce and wanted; fair to choice, $3.50@5; extra heavy, $5.25@5.50.

PRODUCE AND PROVISIONS.

NEW YORK, Friday, Dec. 31, 1880.

There has been no wholesale movement during holiday week that has kept quotations beyond a nominal character. Cold weather and a snow storm have hardened prices for some items that depend upon daily delivery, but these are few. We annex some:—

BEANS AND PEAS.—Beans are selling only for local use and with heavy receipts and accumulating stocks prices favor buyers. Exporting grades have only small outlet: the 750 pkgs for the week do not tell upon the supply to any extent. Peas are dull at $1.65@1.70 for Wisconsin green and $3 for 2-bush. bag B. C.

Marrow beans prime $1.85@1.87, do. other $1.75@1.80, medium prime $1.70@1.72, do. other $1.60@1.75, pea $1.60@1.80, white kidney $1.85@2.05, red do. prime $1.70@1.75, do. other $1.55@1.65, black or turtle soup $1.60; lima $4.50@5.

BEESWAX.—Small sales at 23@24 for Western and Southern.

BUTTER.—Market has had a full fortnight's dullness. The current impression among dealers is that Jan. will open with easier rates all around. Prices are off something for even the light trade now moving. The most confidence is in fine grade western, as the relative prices compared with State, has already given it much of its usual steady call.

Creamery, Western choice 28@33½c; State 24@30c.; poor 20@23c.; State dairies, 20@25c.; firkins, 17@23c.; pails and half tubs, fair to prime 24@27c.; poor, 18@20c.; Welsh tubs, fall, 25@27c.; other 17@22c.; Western imitation creamery, 24@26c.; dairy, good to extra, 22@25c; other 16@20c; factory, fair to best, 14@20c.; other 13@13½c. rolls 19@21c.

COTTON—The market has ruled weak and moderately active. Latest prices are for

December at 11.83@11.85c.; January at 11.86c.; February at 12.06@12.07c.; March at 12.25c.; April at 12.40c.; May at 12.52@12.53c.; June at 12.62@12.64c.; July at 12.70@12.73c.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted.

Strict good ordinary	9 7-16	Middling	11 3-16

Receipts for the week, 32,166 bales. Exports do. 9,475 do.

CHEESE.—Export demand is moderately active only this week and the home trade light, with prices not showing important change. Latest prices are for State factory, fancy, at 13@13½c.; do. good and prime, 12¾@12¾c.; do. fair to good, at 11¾@12¾c.; do. h'f skimmed, 8¾@10c.; Wisconsin factory, fine, 12½@12¾c; do. good to prime, 11¾@12½c.; do. fair to good, 10¾@11¾c.; Ohio factory, fine, 12½@12¾c.; do. good to prime, 11¾@12½c.; do. flat, fair to good, 10@11½c; do. poor to fair, 7@10c.

DRIED FRUITS.—Trade has been slack this week, confined to small lots, with prices not showing important change. Quotations are for

Evaporated apples at 8¼@9¼c. for the better qualities; sliced apples at 5@6½c. for good to choice North Carolina; 3½@4¼c. for Va. apples, 4@4½c. for Tenn. do; 4½@5½c. for State do; 3½@5¼c. for western Ohio and Mich. Peaches at 8@12c. for evaporated peeled; 16c. for unpeeled do.; N. C. peeled at 20@21c.; for the better qualities, unpeeled peaches at 6¼@7½c. for halves and 6¾@7c. for quarters. Plums at 15@16c. Blackberries at 8c. Cherries at 18c. Raspberries at 25c. Whortleberries at 12@12½c.

EGGS.—Receipts for the week, 2654 bbls.; do last week, 3549do. Since the light weather the market shows a decided advance, which supported by the additional wants for holiday cooking. Limed are bringing remarkably good figures.

The annexed high prices are not regarded as settled, as part of the advance may be ascribed to an excited trade.

Near points 28@33, State and Pa. 32@35, Western, 32@35, Southern 32@35, Canadian, 31@32, stored fresh 28@30, State limed, 28@29, Western and Canadian 27@28.

FLOUR.—There is a more confident temper to the market, especially toward the close, with increasing demand.

Latest prices are: $3.00@3.75 for very inferior to very fancy superfine State and Western; $4.00@4.40 for poor to choice extra State and Western, odd lots and lines; $4.40@4 65 for choice to fancy do.; Inferior to good white wheat, trade and family extras, $4 25@5.10; good to choice do. at $5.10@5.85; (very choice up to $6.25;) red and amber winter wheat inferior to choice trade and family, at $4.25@5.85; round hoop Ohio, $4.25@4 75; and trade and family brands of do at $4.80@6.25, the latter for fancy; St. Louis $4.40@5.25 for inferior to good extra; $5.25@6.25 for good to choice, Minnesota clear, inferior to very choice at $4.25@6.00. Minnesota "straight," poor to fancy, at $5 25@7.00, and patent inferior to fancy at $5.75@8.00; city mill extra at $5.20@5.45 for ordinary to very choice for the West Indies; do. for England, $4.20@4.40 for poor to very choice spring wheat, and $4.75@5.50 for winter wheat product; do. trade and family extras, $5.65@6.75; do. for South America, $5.55@5.75; the latter for fancy; No. 2 at $2 85@3.50 for inferior to fancy.

CORN MEAL.—Sales at $3.35 for Brandywine.

FRESH FRUITS.—Cold weather checks the sale of all fruits, and with some doubt as to the condition of stock prices easier to sell.

Baldwins ℔ bbl. $1 75@1 87; Greenings, $1.62@1.75; Spitzenbergs, $1.75@2; Lady apples $1@6. Cranberries in bbls. Capes fancy $7.50@8; other, $4@7; N. J. in boxes $1.50@2.25, the latter for selected. Florida oranges have had a poor season thus far; prices low for original pkgs, ranging $3.50@3.25; Boston pears nominal at $4@6; Catawba grapes $4@5. In nuts there has been good demand; market now quiet. Peanuts, hand-picked Va. 4½@5, other, 3½@4¼. Hickory nuts ℔ bush. of 50 lbs., $1.50@1.75. Black walnuts 60@75. Pecans 9@10c.

FURS AND SKINS.—Some speculation is showing, but there is not activity enough yet to make a precise price scale.

GRAIN.—The whole market has been more or less affected by the severe weather of the past week. In wheat particularly, as it may effect the winter crop, and all articles influenced by the prospective temporary diminution of receipts as shown by the higher prices.

Wheat is active and close strong on a fair export demand. Latest prices are for

No. 1 white at $1.13¾@1.14¾, do December at $1.14, do, January at $1.14@1.14¼, do. February at 1.16⅝, do. March at $1.17¾@1.18, do. May at $1.17¾@1.18; do steamer at $1.12, No. 2 white at $1.12¾@1.12¾; ungraded white at $1.10; mixed winter at $1.14¾; No. 1 red at $1.24@1.25; No. 2 red at $1.16@1.16¾; do. December at $1.16¾@1.16¾, do January option at $1.16@1.16¾; do. February at $1.18@1.19¾; do. March at $1.20¾@1.21¾, do. May at $1.21¾@1.21¾, No. 3 red in lots at $1.14@1.14¾, ungraded red at $1 06@1.21; ungraded Spring at $1.12

Corn is fairly active and firm in price: latest prices are for

New York No. 2 at 57c, do. December at 56¾c., do. January at 56¾@57, do. February at 57¾@57½, do. March at 57¾@57¾, do. May at 55½ bid and 56 asked; new crop No. 2 at 54¾@56¾c; ungraded mixed Western at 52¾@57, No. 3 at 52¾@53; No. 2 white at 57; steamer yellow at 53¾@54.

Oats have realized an advance; latest prices are for

No. 1 white 47½; New York No. 2 white at 46; No. 3 white at 43½; New York No. 1 at 44½; New York No. 2 at 44@44¼, do. January at 43¾@43½; do. February at 45@45½, No. 3 at 43@43½, ungraded white Western at 43¾@45¾, ungraded mixed Western at 42½@44¾, No. 2 Chicago quoted at 44.

HAY AND STRAW.—The severe storm has limited receipts and prices are doing a little better.

Selected retail State hay $1.20@1.30 per 100 lbs; other grades of timothy at $1.15@1.20 do, grades for railway and shipping wants at $1.05@1.10, clover mixed at $1.00@1.05, clover clear at 95c.@$1, salt hay at 65@70c. Straw—long rye: $1.15@1.20, short rye, oat, wheat and barley 85@90.

HONEY.—The market is lower and fails to revive; country dwood lots are beginning to be pressed for sale. White clover, single, 16@17; larger pkgs. 14@16; buckwheat 11@12; extracted, as to color, 6@10.

HOPS.—Trade has been very moderate the past week, exporters indifferent and brewers doing little; prices are without change. Quotations are for

	Cents per lb.
New Yorks, crop 1880, prime and choice	22 @23
Do. medium	19 @20
New Yorks, crop 1880, low to fair	16 @18
Eastern, crop 1880	18 @22
Wisconsin, crop 1880	18 @22
Yearlings, crop 1879, choice	14 @20
Olds, all growths	4 @12
Bavarians	30 @35
Bohemians	35 @40
Pacific coast, new	20 @24

PROVISIONS.—Hog products have been tending stronger and have a fair range.

Mess pork quoted at $13 for old on the spot in jobbts, round lots of new are about $13.50. Bacon at 7.20 for long clear, and 7.50 for short clear. Lard—Western steam at 8.95 for spot lots, 8.95@8.97½ for January, 9.07½ for February, 9.15@9.17½ for March. Stearine at 9@9¼. Tallow at 6@6¼. Beef hams at $17@17.50. Beef, extra India mess quoted at $19@20 for city; $9.50 for extra mess, $8.50 for plain mess, and $13@13.25 for family mess.

POULTRY AND GAME.—Light supplies of dressed poultry have sent up prices for very prime; but with the advance trade naturally slackens after buyers have been so long used to easy figures. Shipping roads are said to be in bad order and arrivals are expected to run light for a number of days.

Turkeys range 14@16, chickens 11@15, poor lots 7@9, chickens and fowls western mixed 6@9¼, fowls, good to prime 9@11, poor 6@8. Ducks, choice 12@14; other 9@11. Geese, 8@12. Squabs, white ℔ doz. $2.50@2.75, dark $1.25@1.50. Live poultry is in small supply and prices are temporarily good. Chickens 11@12, fowls, 9@10c; roosters, 5@7, Ducks, choice, 65@80, other 50@60. Geese, extra, $1.75@2; other $1.25@1.50.

Venison winds up at 6@9 the latter for saddles. No legal sale for it after Dec. 31. Birds have had a good demand and as the weather diminishes supplies prices are firm.

Canvas back $1.25@1.75, red heads, 50@75; mallard 50, teal, 30@40, common 20@25, quail prime trapped ℔ doz $1.87@2, poor $1@1.50, partridges, 37@75, the latter for State. Grouse prime $1.12@1.20, drawn 90@$1 Hares, 25@30. Rabbits, 15@20.

SEED.—Clover is steady at 8@9¼ for fair to strictly prime, to 9¾ for extra choice. Timothy is inactive at $2.75@2.85.

VEGETABLES.—The weather is risky for the potato trade and prices are not above steady.

Potatoes, E. Rose Eastern double heads $2@2.25, State, $1.75@2; do. in bulk $1.75@1.87; prolific do. $1.50@1.75; Burbank do. $1.50@1.75; do in d. h. $1.75@1 87 peachblow do. $2@2.25; snowflake $1.75@2; peerless State $1.50@1.75; N. J. $1.37@1.50. Sweet Del. $2.50@2.75. Onions, white, $5@5.50; yellow, $3.25; red, $3.00@3.25; Chester, $3.00@3.25; marrow squash, 40@50; Hubbard, 75c.@$1; beets, 75c.@$1; carrots, $1.25@1.50; R. turnips, 50@75c.; white, do. 50@75; cabbage, ℔ 100, $3@5; red, do. $4@6; celery ℔ dozen, $1.00@1.50; cauliflower, ℔ bbl. $4@7.

WOOL.—Has been very quiet this week, on account of the holidays and is essentially in price as quoted last week.

LIVE STOCK MARKETS

NEW YORK, Friday Dec. 31, 1880.

BEEVES.—Receipts for the week 9,575 head; do last week 11,215 do. Light receipts and good butchering weather have kept the market brisk all this week with an advance in the under good grades since Wednesday. Such dry cows, heifers, oxen and stags that are pushed upon the market at this season sold at 3½@4½c. live weight; some bulls sold at 3¼@4¼. Poor to fair steers ranged at 8@10 to dress 55@56 lbs.; good to extra 10½@12¾ Average price of beef cattle for 1880, 9¾c., against 9c. strong in 1878.

COWS AND CALVES.—There is no positive market. An inquiry for fine milkers would be apt to be sent to the country without depending upon current receipts.

SHEEP AND LAMBS.—Receipts for week, 22,138 head; do last week, 23,181 do. Market firm with moderate supplies. Sheep ranged $5.25@6.60 per 100 lbs.; lambs $7 75@7.37½ do.

SWINE.—Receipts for the week, 22,490 head; do. last week, 32,470 do. Weather favorable for packing and the market not well supplied.

Live hogs, corn, $5.45@5.55 per 100, country dressed pork 6@8, light to heavy city dressed State 6@7¾, city dressed Western 6½@6¾. Western dressed 6@6¾. Pork tenderloins 10½.

VEAL CALVES.—Live calves are scarce and high. Best N. J. quick at 8, prime State and N. J. 7½@7¾, fair to good 6½@7, poor 5½@6, Mt. Holly, 5@8, heavy to light buttermilk, 4@5, grassers, 2½@2¾, hog-dressed calves scarce with blocked roads: prime 10½@11, fair to prime 8½@10¼, very common 4½@7.

Comparative receipts live stock:—

KIDNEY-WORT
The Only Remedy
That Acts at the Same Time on
The Liver, The Bowels and The Kidneys
This combined action gives it wonderful power to cure all diseases.
Why Are We Sick?
Because we allow these great organs to become clogged or torpid, and poisonous humors are therefore forced into the blood that should be expelled naturally.
KIDNEY-WORT WILL CURE
Biliousness, Piles, Constipation, Kidney Complaints and Diseases, Weaknesses and Nervous Disorders.
by causing free action of these organs and restoring their power to throw off disease.
Why Suffer Bilious pains and aches?
Why tormented with Piles, Constipation?
Why frightened over disordered Kidneys?
Why endure nervous or sick headaches?
Why have sleepless nights?
Use KIDNEY-WORT *and rejoice in health. It is a dry, vegetable compound and* One package will make six qts of Medicine. *Get it of your Druggist, he will order it for you. Price,* $1.00.
WELLS, RICHARDSON & CO., Proprietors, Burlington, Vt.
(Will send post paid.)

Liquid KIDNEY-WORT
In response to the urgent requests of great numbers of people who prefer to purchase a Kidney-Wort already prepared, the proprietors of this celebrated remedy now prepare it in liquid form as well as dry. It is very concentrated, is put up in large bottles, and is equally efficient as that put up dry in tin cans. It saves the necessity of preparing, is always ready, and is more easily taken by most people. Price, $1 per bottle.
LIQUID AND DRY SOLD BY DRUGGISTS.
WELLS, RICHARDSON & CO., Prop'rs, Burlington, Vt.

Reading for the Young.

THE HIRED SQUIRREL.

A LION to the squirrel said:
"Work faithfully for me,
And when your task is done, my friend,
Rewarded you shall be
With barrelful of finest nuts fresh from
My own nut tree."
"My lion king," the squirrel said, "to this
I do agree."

The squirrel toiled both day and night
Quite faithful to his hire;
So hungry and so faint, sometimes,
He thought he must expire.
But still he kept his courage up, and tugged
With might and main.
"How nice the nuts will taste," he thought,
"When I my barrel gain."

At last, when he was nearly dead,
And thin, and old and gray,
Quoth lion: "There's no more hard work
You're fit to do. I'll pay."
A barrelful of nuts he gave—ripe, rich,
And big, but oh!
The squirrel's tears ran down his cheeks:
He'd lost his teeth, you know.

FARMING FOR BOYS AND GIRLS.—NO. 8.

HENRY STEWART.

Draining.

PLANTS cannot live without water; but neither can they live in an excess of water. When the soil is in a right condition of moisture plants and crops thrive. When the soil is too much filled with water the plants become sickly, the leaves turn yellow and drop from the stems, because they are drowned. They are drowned, in fact, just as much as any animal that needs air to breathe is drowned and dies when plunged into the water; for plants need air as well as animals, and if the roots of a plant are covered up with water they can get no air, because the water drives the air out of the soil, and being heavier than the air, takes its place.

To test the presence of water in the soil, one may dig a small hole, as shown at A, figure 21; if the water rises in the hole to within a foot of the surface, as shown by the lines in the open space, one may be sure that the water stands at the same hight all through the soil. This is evident to every person, young or old; and the fact depends upon a law of hydrostatics, which is that branch of science which relates to the pressure and movements of water and other liquids. This law is, that liquids when at rest always preserve an even, level surface. This is shown more plainly by the illustration B, figure 21, of a bent pipe, in which, when

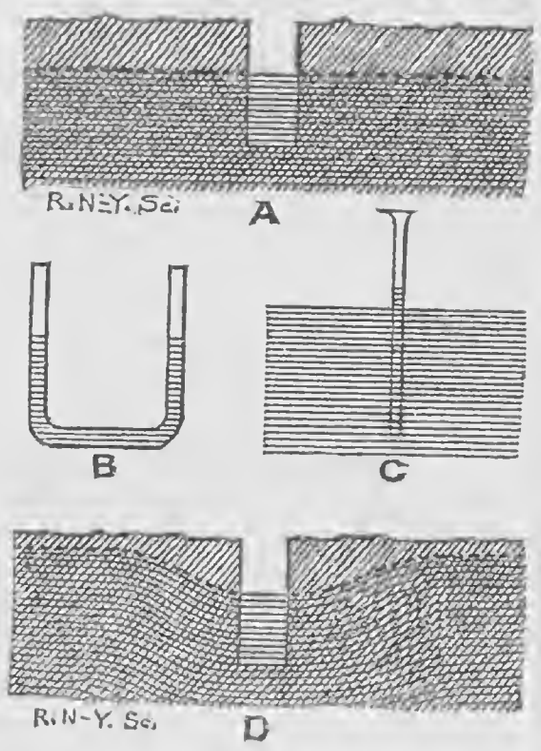

FIG. 21.

water is poured into one part of it, the water rises in the other part to precisely the same level.

It is on this law that the action and presence of springs depend; for a spring bursting out of the ground, or the water rising in a well, is simply the effort of the escaping water to rise to the level of its source, which may be at a distance. So, when the hole is dug in the soil, the hight to which the water rises in it is exactly the same as that to which the water lies in the surrounding soil. This line is called the water-table, which means in other words, the water surface below the soil, and this water-table is represented at A, figure 21, by the dotted line above the darker shading. The darker shading represents the wet soil and the lighter shading the dry soil. If a crop should be planted in a soil filled with water to this extent, the roots will descend until they reach the water, when they will stop growing, and as they stop, the plants stop, because the roots are the mouths of the plants, so to speak, and when they stop the gathering of food the plants starve and grow no more. Indeed, the facts are even worse than this, for the following reason: There is another law of hydrostatics, which is, that water will rise above its general level in narrow tubes, as shown at C. This is called capillary attraction, because the narrow tubes may be likened to hairs. The word is derived from the Latin *capillus*, a hair, and *capillaris*, belonging to a hair.

The same action takes place in sand or loose soil because the spaces between the grains of sand act precisely as small tubes and so the water rises in these spaces. A sponge or a piece of loaf sugar sucks up water in the same way. Thus the water rises higher in the soil than in the hole and may even reach very near the surface at a short distance from the hole; as seen at B, where the water table is seen to be lowered considerably by the hole dug in the soil.

This water in the soil is removed by drainage and this process is one of the most important in the art of cultivating the soil. It has made pleasant, healthful and fruitful fields, of offensive, unwholesome and useless swamps and marshes; it has doubled and trebled the yield of thousands of fields, it has enriched the farmers who have applied it to their lands, and it has been the means of producing food for thousands of industrious workers who without it would have lacked the means to live.

There is another injurious effect which is produced by water in the soil which should be mentioned. Where water exists, air cannot go. Let us then consider for a moment the condition of soil that is filled with water and that of one which is free from it at the opening of Spring. The snow has disappeared; the beams of the sun cheer the glad soil; the warm breath of Spring comes from the South and blows upon the earth; but the soil filled with water to the surface, or very nearly, receives no warmth, the sun's heat is lost and wasted upon it, for no heat can penetrate the dense mass of sodden earth and no warm air can enter its pores. It remains cold, and no evidence of life springs from it. But the soil which is drained has parted with its water; this has sunk down into the drains or the under soil and has flowed away. As the water sinks down the warm air rushes in to take its place; the sun beams upon the soil and its heat goes down into and warms it; the roots of the plants are awakened from their winters sleep; they drink in the warm air and absorb the heat of the sun. With a suddenness unknown in other climates and countries than ours, vegetation bursts into life with a bound, and we exclaim as we look around, amazed at the surprising change, "Summer is come!" Yes, Summer to the industrious skillful farmer who may bring out his plow and turn over his drained fields; but it is still Winter to the farmer who has neglected to avail himself of all the benefits which drainage of his fields would have conferred upon him, for his plow must still remain idle and he must lose all the advantages which are derived from early planting and a warm dry soil, because his fields are too wet to be plowed and so cold that the seed would rot in them.

CHRISTMAS AWAY UP NORTH.

TO THE HORTICULTURAL CLUB:—I often read in the RURAL letters from the nephews and nieces. I am an auntie and very fond of all little nephews and nieces. I am sure that you will be glad to get a letter from an auntie who has spent several winters far north, on one of the most dreary, ice-bound shores of America. I went there to teach school, and the first time I saw the rough-looking, big boys of whom I was to take charge, my heart failed me. Most of them were half-breed: that is, one of the parents being Indians. But love works wonders; I soon won their regard, and found my work of teaching them a great pleasure.

My school-children informed me that it was customary to give the teacher a "fling" they call it, on their birthday. I inquired and found that they usually had a dance with cakes and rum, and every one who came to the dance paid a shilling in money or goods, all of which was given to the teacher. I told them that I had a dear friend whose birthday I wished they would join me in celebrating. They listened with the greatest attention while I told them how rich this friend was, and that He loved little children, and would be so glad to have them keep his birthday. I said, "Every one of you can bring him a gift, which will please that dear friend much. That is your love."

Then I said, "I suppose, children, you know all about Christ-mas?" "Oh, yes!" they replied, "is that the fellow you are speaking of? Why, when he went away from the coast he was very poor. And do you know him? He knows us very well. Many a funny story he told us." It was my turn to be astonished. Was it possible that these children had never heard anything about that most beautiful day—Christ-mas?"

It was just eight days to that honored birthday, and my scholars joined me heartily in making preparations to celebrate it. The boys were busy every evening cutting evergreens for us to make into wreaths and to festoon round the school-room. The girls and I made cakes, and I was the lucky possessor of a barrel of apples.

It was 10 o'clock the night before Chrismas Eve before I found time to go to the woods to get that tree which you all know about, but which was a mystery to the children of this ice-bound coast. Off we started at 10 o'clock, teacher, boys and girls, to the number of twenty-five. It was cold, but the moon was very bright. Only those who have been in the far North in Winter have seen the moon shine in all its glory, and the aurora-borealis adding its light making the scene magnificent beyond description. We had toboggins with dogs attached to them, and snow-shoes for the bush. We brought home a goodly tree, and also a quantity of mountain-ash berries to deck the evergreens with.

By seven o'clock Christmas Eve all was ready, the tree being loaded with rosy apples and presents, for every one of my scholars had an apple and a present. The tree was lighted with bits of tallow candles stuck on every branch. I had invited the parents, so the school-house was crowded. All were filled with admiration, and while I told them of the wonderful love of Him whose birthday we were celebrating, and what that Christ had done for us all, that rough crowd kept a solemn silence. I asked the children if they had "prepared a gift for that best of Friends." One of my scholars answered, "You told us He wanted our love." I said, "Yes; will you give Him your best love?" And they all pledged their love and obedience to Him who had come into this world to die for them. And that night I lay awake, thinking with grief of how many of my little nephews and nieces, who know all about that much-to-be-honored Friend, and yet have never brought Him such a gift. But I must conclude my story. We sang hymns and played games until midnight. I remained on the coast several years, and was rejoiced to see my Christmas tree bear much good fruit.

AUNTIE C. E. T.

Arthabaskaville, P. Q.

LETTERS FROM THE COUSINS.

UNCLE MARK AND RURAL COUSINS:—I will now report my success and failures with the seed sent me from the RURAL. The okra didn't come up at all. I was sorry, but fortunately had plenty without it. The Surprise muskmelon did not do well; I didn't get one good one. They were all faulty. I suppose the soil did not suit them. The portulacas were wonderfully beautiful; every morning there would be a perfect boquet of bright colors. I have saved a great many seeds from them. I only had two or three plants of phlox to bloom, but we have a very large bunch in the garden, which is very beautiful. I only had one plant of Double China pink. The mignonette were very sweet, but just as soon as they bloomed they all died, until I only had one plant living, when one morning I found it covered with something looking like red spiders. I poured some warm soap-suds on it, which killed the insects. I am going to try to better prepare for my flowers next year. I think Bertha Estella would be a pretty double name for Mary Walker's little sister. Stella would be a pretty single name.

LOUDIE S.

Griffin, Ga.

DEAR UNCLE MARK:—I have thought for some time that I would write to you, to see if you would let me join your club. I am a farmer's daughter and have a garden of my own to cultivate and I would be pleased to receive some seeds. I have many pets, three cats, Frank, Tilly and Pearl; a large black dog named Rover, and a canary bird named Charley. Rover can jump through a hoop as nicely as a circus performer. We have a great many flowers in the summer. At the town fair here this fall our flowers took the second premium, we mean to get the first premium next year. Your affectionate niece,

Sullivan Co., N. Y. MARY E. CARRIER.

DEAR UNCLE MARK:—I have often thought I would ask you to let me become a member of the Horticultural Club. I am seven years old, I go to school most of the time. I have a garden in which I raise flowers. I hope you will send me some seeds. I do not grow many kinds but they are generally very nice. Yours,

Beaver Co., Pa. BESSIE MCCLOUD.

DEAR UNCLE MARK:—My father takes the RURAL and we like it very well. I would like to join your club if you would take me. My mother has promised me a piece of ground to plant with flowers, and I hope you will not forget me when you distribute your seeds. Your nephew, J. G. LANG.

Dutchess Co., N. Y.

Sabbath Reading.

THE PARABLE OF THE TALENTS.

IN the parable of the talents, we are taught what is the accountability of men, however their circumstances or condition of life may differ. "The kingdom of heaven," said the Savior, "is as a man traveling into a far country, who called his own servants, and delivered unto them his goods. And unto one he gave five talents, to another two, and to another one."

The condition, then, here represented is that of steward, and the principle to be maintained is that all men are responsible to God. They have received from Him certain trusts, to be employed according to his will, and with a view to his glory, and for the right keeping of which they shall one day render account: it may be with grief, it may be with gladness. It is required of a steward that he be found faithful: faithful to his master by whom the great trust has been committed to him and faithful to his fellow-servants, for whose benefit he was put in trust.

What, then, are some of these talents or trusts for which we are held accountable? First, God has endued us with our natural powers. These are high trusts, for which we shall be reckened with, according to our means and opportunities of employing them, according as their strength or feebleness may be. There are some with faculties of a high order; master-spirits, who by their powers of reasoning, or force of eloquence, can sway the masses either for good or evil. Upon such as these there rests a heavy responsibility. "To whom much is given, of him shall much be required."

There is, again, the responsibility arising out of our position in life, and the influence it gives; our worldly circumstances, our education, our opportunities of usefulness. Above all, there is the responsibility arising out of the dispensation under which we live, in gospel times and with gospel privileges. Numerous, indeed, are the gifts bestowed upon all, and the graces bestowed upon some, but ever upon the stewardship, and this, whether we regard our natural life or our religious privileges. Think of our services and sacraments ordained by Christ himself; the written word and a living ministry. "warning every man," says the apostle, "and teaching every man, that we may present every man perfect in Christ Jesus."

How should not this urge us to the right improvement of our several trusts, the wise employment of the talents which God may have given us, knowing that to abuse, or not rightly to use them, will constitute a crime for which we have to give, a reckoning. And yet, as with the servants in the parable, some traded more or less diligently and gained other talents, while some hid theirs in a napkin and gained nothing; so among the professed followers of Christ some are diligent and improve their opportunities, others are slothful, negligent, and do nothing for their absent Lord.

You see, then, what it is that constitutes our stewardship, and in what our responsibility consists. Not ministers and teachers only, but we all are stewards when we consider our natural faculties; we are stewards when we consider our social advantages, our domestic blessings, and religious privileges, and are accountable to God for all.

We have now to notice the special qualities which are required in the condition of a steward and they are two, fidelity and wisdom. "Who," said the Savior, "is that faithful and wise steward, whom his lord shall make ruler over his household?" The practical question is, How are these qualities to be realized?

Well, to be faithful as a steward in things of this world one must ascertain what are the duties of his calling. To do right in any office it is necessary that we have a correct knowledge of our work, the object and scope of it. It is absurd for a man to undertake a work of which he knows little or nothing.

Now, if this be true in earthly callings, how much more in things spiritual. It therefore becomes a first duty of the Christian to know what is the will of God, that we may know what our duty is: and secondly, we should ask of God that He would give us guidance, grace and wisdom, that we may do in a way and in a spirit well-pleasing in His sight.

Again, as good stewards we must bring to His service such feelings of attachment to our Master and such love for His work as will show that we are worthy depositories of the trust confided to us. And many are the considerations why we should cherish such feelings. From infancy He has crowned us with mercies and loving kindnesses. He has sent His Son, His only begotten Son, to redeem us from sin and its consequences; and has opened to us the prospect of a glorious immortality beyond the grave.

Further, as good stewards we must not only know what is our duty; we must do it. A mere knowledge of the Master's will, or a mere profession of attachment to His person, however ardent, will not do. Something more is needed; there must be diligent working. Christianity is not merely a creed, it is a power; not a system of belief, but a habit of work. This it is which marks a knowledge that is practical, a genuine faith. There can be no real faith in the heart where there is no fruit brought forth in the life. "I must be about my Father's business," said Christ; "I must do the work of Him that sent Me." Let this be our resolve: "I must be about my Father's business," "I must do the work of Him that sent me."

No one ever designed injury to another but at the same time he did a much greater to himself.—Bishop Butler.

No sense in having sickness in the family if you will use Hop Bitters in time. Ask those who know.

PERSONAL ITEMS.

Mr. and Mrs. Jefferson Davis will go to Europe.

Lord Beaconsfield's "Endymion" is said to have paid him about fifty cents a word.

Mrs. Jessie Fremont has organized classes in history among the grown-up sons and daughters of the poor settlers in Arizona.

Mr. James C. Flood, of San Francisco, is said to have had transactions to the amount of $300,000,000 in the stock exchange during the last five years.

The sale of season tickets for the Bernhardt engagement closed at Chicago aggregated $7,000. This is the heaviest sale of the kind ever made there.

The President has ordered a court-martial to convene at West Point, on January 18, for the trial of Cadet Whittaker, the court having been ordered at the request of the accused.

Brig.-Gen. Randolph B. Marcy, Inspector-General, and Col. John G. Barnard, of the Corps of Engineers, were recently placed on the retired list by the President, their retirement to date from Jan. 2.

Mr. A. S. Logan, a lineal descendant of the celebrated Indian chief of the Six Nations of that name, so well known to juvenile orators, has been appointed by Secretary Schurz to a position in the Interior Department.

The remains of Lieutenant Irving, of Sir John Franklin's Arctic Expedition, brought to New York by Lieutenant Schwatka, and which arrived at Glasgow on the 25th instant, on the steamer Circassian, are to be buried at Edinburgh.

General Robert Toombs and Senator Brown were on the point of fighting a duel a few years ago. The challenge was sent and accepted, but fortunately the affair was compromised. It is said that Mr. Brown practiced savagely in anticipation of the sanguinary event.

Rev. Dr. E. H. Chapin, the leading and most celebrated Universalist clergyman in the country, died at New York City, on the 29th, aged sixty-six years. The funeral services were very imposing; Dr. Colyer, Dr. Armitage and Rev. Henry Ward Beecher making eulogistic addresses.

Hon. A. L. Akerman, died at his home in Cartersville, Ga., on the 21st inst., after a week's sickness from inflammatory rheumatism. He was born in New Hampshire and, after graduating at Dartmouth College, went to Georgia and practiced law. He was a Unionist during the war, took part in the Reconstruction Convention of 1867, and in 1870 was appointed Attorney General of the United States by President Grant. He was succeeded by Mr. Williams.

[Chicago Tribune.]

Thomas O. Thompson, Esq., the Mayor's Secretary, who, some few days ago slipped on a banana peel and sprained his knee, writes that St. Jacob's Oil "acted like a charm."

Humorous.

"THERE'S no place like home," repeated Mr. Henpeck, looking at a motto, and he heartily added: "I am glad there isn't."

No matter how poor people are, nearly every one can afford to keep a pair of horses—one for clothes and the other for wood.

"MARY JANE, have you given the gold fish fresh water?" "No, ma'am; what's the use? They haven't drank up what's in there, yet."

WHEN a dead man's property is put under the hammer, it is the sale of effects, but when a man gets sea-sick, it's the effect of a sale.—Baltimore Every Saturday.

"SCIENCE enumerates 588 specimens of organic forms in the air we breathe. Just think of it! Every time you draw in a breath a whole zoological garden slips down your windpipe.

"GIVE Me My Heart," is the title of a poem sent in by "Penelope." Certainly; we will send it by return mail. If any more of your anatomy is missing notify us by telegraph.—N. Y. Graphic.

AN exchange says that "up in New Hampshire you can, for $2.50, purchase a barrel of cider with a yellow dog thrown in." Yes, but hang it, who wants a barrel of cider into which a yellow dog has been thrown?—Boston Post.

SHE asked the clerk if he was positive—thoroughly convinced—the eggs were fresh. "Oh, yes," said the young philosopher, "I know they are. Why, the farmer said none of his hens were more than a year old." She bought a basketful on the spot.

A Chance for Health

Is afforded those fast sinking into a condition of hopeless debility. The means are at hand. In the form of a genial medicinal cordial, Hostetter's Stomach Bitters embodies the combined qualities of a blood fertilizer and depurent, a tonic and an alterative. While it promotes digestion and assimilation, and stimulates appetite, has the further effect of purifying the life current and strengthening the nervous system. As the blood grows richer and purer by its use, they who resort to this sterling medicinal agent, acquire not only vigor but bodily substance. A healthful change in the secretions is effected by it, and that sure and rapid physical decay which a chronic obstruction of the functions of the system produce is arrested. The prime causes of disease being removed, health is speedily renovated and vigor restored.

"SPARE THE ROD, AND SPOIL THE CHILD."

The Literary Revolution

"Peace hath her victories, no less renowned than war." This is acknowledged to be the most successful revolution of the century. Is it not also the most important? It brings knowledge and culture within reach of all who aspire to them. Books supply the most permanent and fruitful sources of enjoyment. Whose will may now possess them. The list of publications already comprises nearly 175 volumes of standard works, and the number is being increased with unprecedented rapidity. You can get full descriptive catalogue and an illustrated pamphlet telling how books are made, and describing the setting of type by steam, free on application, and you can get the books themselves from the leading bookseller in every town. The comments of Press and People are most noteworthy. "The day of cheap and good books is once more with us, and the American Book Exchange merits the praise for it."—*Episcopal Register*, Philadelphia. "We can only repeat our hearty commendation."—*Traveller*, Boston. "Is doing wonders in book-making. We pronounce them the best books for the money that ever came to our notice."—*Watchman*, Boston. "Has some rich relative left you a colossal fortune which you are spending in publishing books for the people at nominal prices? If so, I admire your taste. But wont the old-line publishers be glad when it is gone?"—queries a facetious but appreciative correspondent. "At these rates every man may, and every man should, have a library." *Alliance*, Chicago. "Your common people than the Peabody Fund," writes a Southern educator. "The American Book Exchange is doing a very remarkable work." *Journal*, Boston. "Other publishers may sneer at them, but so long as the Exchange publishes a book at one-tenth the cost at which it is offered elsewhere, sneers cannot hurt them."—*Courier-Journal*, Louisville. "Any body can afford to own a cyclopædia now."—*Press*, Ellenville, N. Y. "Cheap beyond all precedent in book-making." *Capital*, Columbus, O.

Type-Setting Is Marching On! By Steam.

Amazing Offer!

Chambers's Encyclopædia.

Ten years ago this great work could not be had for less than $50.00. The Literary Revolution gives you a verbatim reprint of the last London edition in 15 elegant and handy cloth bound volumes, small but clear type, for $7.50. In this style it is now complete and being delivered to purchasers—in immense quantities, of course. The same work is also being issued in large type, under the title of the "Library of Universal Knowledge," in 15 large octavo volumes, the price in cloth binding being $15.00, and in half Russia, gilt top, $22.50. To this edition an able corps of American editors are adding about 15,000 topics not treated in the original Chambers's, thus more thoroughly adapting it to the wants of American readers, and making it the largest Encyclopædia ever published in this country—about 10 per cent larger than Appleton's (price, $20.00), and 20 per cent larger than Johnson's (price, $50.00). In adaptation to the wants of general readers Chambers's has always ranked at the very front. Now thoroughly revised, it is several years the latest in the field. You can want nothing better. Of this large type edition the first seven volumes are ready January 10, 1881, and the remaining volumes will follow about two each month, till the work is completed. Notwithstanding that our prices are low beyond example, it is our custom to give special inducements to those whose orders are soonest received. Accordingly, the price for the 15 volumes in cloth, orders with cash to be received by us on January 1, is only $11.00, and for the half Russia, gilt top, $16.50. The price of the edition in cloth will be advanced two cents every day (Sundays included) after January 1, and the price of the half Russia, gilt top, three cents every day, till the full price of $15.00 and $22.50 is reached. You will therefore readily see the wisdom of sending your order promptly when you have read this. The volumes now ready will be sent to you at once, and the remainder as issued, or as you may direct. As above stated, the books may also be ordered of the leading bookseller in every town. Liberal terms are allowed to clubs. Descriptive catalogue sent free on request. Remit by bank draft, money order, registered letter, or by express. Fractions of one dollar may be sent in postage stamps. Address

Only $7.50. Large Type. American. 2 Cents Lost Every Day That You Delay.

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME.

VOL. XL. No. 3. WHOLE No. 1616. | NEW YORK, JAN. 15, 1881. | PRICE FIVE CENTS. $2.00 PER YEAR.

[Entered according to Act of Congress, in the year 1881, by the Rural New-Yorker, in the office of the Librarian of Congress at Washington.]

Pomological.

THE MRS. BRETT PEACH.

MR. RICKETTS left at this office several peaches of a new variety which he calls Mrs. Brett. They were of beautiful appearance. Mr. Downing favors us with the following description:—

A chance seedling in the garden of Mrs. Maria Brett, Newburgh, N. Y. Tree vigorous and an abundant bearer; flowers small. Glands globose. Fruit large, roundish; suture small, but distinct, extending a little beyond the apex, which is a small point; skin whitish, shaded over half the surface with light and dark red, brownish red where fully exposed; flesh white—red at the stone—juicy, melting, sweet, slightly vinous, rich and of very good quality, separates freely from the stone. Ripens the middle of September.

CHARLES DOWNING

[The engraving is an exact reproduction of one of those left at the office by Mr. Ricketts.—EDS.

NOTICES OF PEACHES.

WITH NOTES TAKEN AT MATURITY.

T. T. LYON.

YELLOW RARERIPE is a name applied by different persons to several distinct sorts. For this reason it behooves the planter to purchase with great care, if he would be sure of the genuine sort, which, according to Downing, has globose glands and small flowers, and ripens very nearly with Early Crawford. A peach somewhat grown here under this name is creamy-yellow, with scarce a trace of red, and ripens at least two weeks after Early Crawford. It is hardly "good."

Another is of medium size, oblong or oval (instead of round), rich yellow flesh, firm, fibrous, but melting in texture, with mild vinous flavor. A good market variety. Neither of the above will sustain the character given in Downing's description of the genuine variety.

RICHMOND, which originated some years since with the late E. Ware Sylvester, of Lyons, N. Y., was at first supposed to be a comparatively late variety; but several years' fruitage determines that, while it is an improvement upon Early Crawford so far as beauty of color is concerned, it commences to ripen while the other is yet in season, only continuing slightly longer. The tree, in nursery, is less vigorous than many others, although, in orchard, it bears a favorable comparison. In the Lake Shore region it is growing in popularity, and seems likely soon to become a leading market variety, since its chief competitor,

EARLY CRAWFORD, is open to the charge of comparative unproductiveness, although it is probably even yet more extensively planted than any other single variety. This is certainly the case within the limit of my direct observation. This result is, however, probably due in part to the circumstance that in our Western markets almost all yellow peaches of that season pass as Early Crawfords.

FOSTER, when first disseminated, was also expected to extend the season of the Early Crawford; but, so far, it has proved more nearly identical in season than Richmond, while it has not, even yet, succeeded in acquiring precedence of that old favorite in any important particular, save possibly that of richer or higher coloring. Its status cannot yet be said to be fully determined, especially as a market variety.

HONEST JOHN is one of those fickle titles which seem, in obedience to some unaccountable fatality, to fasten themselves first upon one variety and then upon another. Fixing itself first upon Serrate Early York, and afterwards upon Large Early York, it has since become a pseudonym of a yellow peach somewhat known in Western New York; and thence, either with that, or, very probably, in connection with several varieties of yellow peaches, it seems to have been transmitted to Western Michigan, where, as yet, little has been done to detect these fallacies and identify the estrays. The sooner such parasitical names can be arrested and banished from the arena of civilized pomology the better for all concerned.

COOPER'S MAMMOTH is also a floating name, for which no person or variety seems to be held responsible. I received and planted trees under this name more than forty years ago, which on fruiting proved to be Early Crawford. I have often since seen the name, even in the catalogues of very pretentious nurseries; but it seems never yet to have become attached to any variety which it was fairly entitled to represent. In Western Michigan I find it given to a large, showy, serrate, yellow peach, which a planter here found in his collection, simply for the reason that he was unable to identify it with any known variety.

PEACHES ON THE EASTERN SHORE OF MARYLAND.

J. W. KERR.

AFTER reading the articles of Mr. T. T. Lyon, of Michigan, on peaches, I think the influence of soil and climate on certain varieties asserts itself as a matter deserving intelligent consideration by commercial planters in all sections. A peach that is of value anywhere else, is, as a rule, not likely to lose any merit when introduced to the genial influences that notably give perfect development to all that tends toward quality in that fruit, here on the "Peach Peninsula." But we find that the "rule" works differently when some of the varieties that are excellent here, are taken elsewhere. For instance, Bilyeu's Late (or Comet, as it is sometimes called) introduced here several years ago by a Mr. Bilyeu, and which is a fine very late peach—resembling "Old Mixon Free" in size and color—is almost totally worthless in some sections farther South. The same is the case with several other varieties that are very good here.

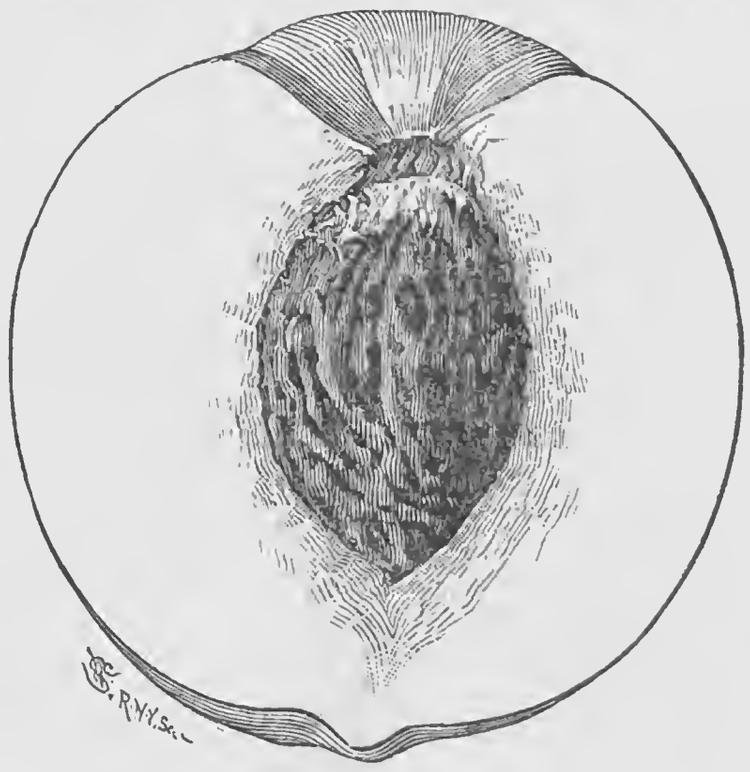
The Early Tillotson succeeds well enough here, but the more intelligent market growers incline to the belief that serrated leaves are an infallible indication of inherent weakness or debility, and, guarding well the vigor and healthfulness of their orchards, leave the serrated varieties out. My own observation and experience in that relation compel me to indorse the practice. The identity of the Alexander and Amsden, referred to by Mr. Lyon, is no less marked here than in Michigan, and, in fact, the similarity existing among all the quite early kinds, is such as to prompt an indorsement of the views of a Pennsylvania pomologist as expressed in a private letter a few weeks back, viz.: "When you have Alexander you have all." "Troth's Early," says Mr. Lyon, "is desirable only as a prolific early market peach, and is hardly good enough even for that purpose." Here there are few varieties more popular than the Troth; in fact, it leads all other white-fleshed sorts; its strong points of excellence being productiveness, freedom from rot, good color, shipping qualities equal to the best, and, with good culture, the quality is good, and the fruit always commands remunerative prices in market.

Mountain Rose has superseded the Early York on this Peninsula; and properly too, as it is in all respects superior to the best of the Early Yorks. In turn, however, the Mountain Rose is likely to be eclipsed for market purposes by Harris's Early, which is much larger, though not as prolific; but size has a telling effect in market. The feeling and tendency among peach growers here for the last three years, have been the same as described by Mr. Lyon as prevailing in Michigan, viz.; the commercial growers have been confining their planting largely to the yellow-fleshed varieties. Crawford's Early, Mary's Choice, Reeves's Favorite, Crawford's Late, Beer's Smock, Garey's Hold On, and Salway comprise the bulk of every selection, with variations in accord with the individual circumstances of the planter.

The action of the canners has been mainly instrumental in creating the demand for yellow-fleshed peaches. As is plain to everybody, a yellow-fleshed peach, when canned, carries a deliciousness in its appearance far surpassing in attractiveness the white-fleshed kinds; and, indeed, well ripened Mary's Choice (*i. e.* when the fruit is just ready to merge into the soft stage), when nicely canned, are superior in a large degree to any white-fleshed peach that it has been my good fortune to test. Prince's Excelsior is another yellow peach that is very fine for canning, retaining, to a large extent, all the superior flavor it has when freshly picked from the tree.

At the present time another demand is springing up very rapidly, that bids fair to divide popularity between yellow fleshed and white-fleshed peaches. This is the evaporating or drying industry. In this the requirement is the opposite of that in the canning business, to insure the largest remuneration; as the whiter and more delicate in appearance the evaporated fruit, the higher its rank in market. Hence, those who are now planting with a view to drying, want mainly such kinds as Troth, Old Mixon Free, Moore's Favorite, Mountain Rose, Stump-the-World, Silver Medal, etc. This industry will secure to the peach grower advantages which he has not enjoyed heretofore, as he was compelled to sell his fruit when ripe, whether the price was high or low, or otherwise allow large quantities to rot in the orchard. Now, when the prices in market rule too low to afford compensation for his trouble, he can dispose of his fruit to better advantage either by drying it himself, or having it dried on shares by other parties; so that the growing of peaches is likely to be continued with increased zeal for years to come.

Caroline Co., Md.



THE MRS. BRETT PEACH.—From Life.—Fig. 23.

The Vineyard.

THE PARENTAGE OF THE GRAPE OF THE FUTURE.

EDITOR OF THE RURAL:—Please explain which you mean—Vitis æstivalis, or V. cordifolia, when you say in the RURAL for '80 on page 707, "It would seem that we have the least to hope for from seedlings of, or crosses with, the Frost or Summer Grape." If you mean V. cordifolia, then you may be right, but hybridists would not like to dispense with even this class, and we generally esteem V. æstivalis the most promising of all our classes.

D. S. MARVIN.

[We meant what we said, viz., that we have least to hope for from seedlings of, or crosses with, *either* the Frost Grape (V. cordifolia) *or* the Summer Grape (V. æstivalis). EDS.]

PROF. HUSMANN takes Mr. Marvin's view. He says that he is inclined to believe that only the Summer and Frost Grapes will give us the true wine grapes of the country and that, if we can increase their size somewhat, they will also be the best table grapes.

NEWBURGH, Dec. 22, '80.

ED. RURAL:—In reply to your note I do not know of any seedling from Vitis æstivalis of any worth, of my own knowledge.

CHAS DOWNING.

Vitis Æstivalis.

It is to this class we look for our best wine grapes, of which Herbemont, Cynthiana, Cunningham and Norton's Virginia are the most prominent old sorts. By crossing these with Labrusca and other classes there is no doubt that grand results may be obtained, and a few have already been produced that yield a most delightful dry wine. Prominent among these I would mention No. 331 raised by Mr. Ricketts. It is Æstivalis crossed with Labrusca, partaking more of the former than of the latter; color, black; berry, medium; pulp, soft, tender and juicy. In 1878 its must stood 105 saccharine matter or sugar contained in the expressed juice, and 7.50-100 per mill. acid. I have seen the wine from this grape frequently sampled while standing in bottles allowed to remain partly filled, and at the same time it was perfectly clear and brilliant, retaining all its flavor and bouquet. When the grape is pressed immediately after crushing, it produces a pale, amber wine of fine flavor, and although the samples of which I speak are but two years old, they are quite soft and mellow. Mr. Ricketts has other promising seedlings of various Æstivalis crosses, which may prove valuable for wine. I hope some day not very far distant, to send you samples of some of my

seedlings of this class, one in particular, a cross between Bacchus and Herbemont, to which I look with much interest. I am making collections of various sorts of wild Æstivalis for the purpose of further experiment, and will inform you of the result, if anything of interest presents itself,

Fishkill, N. Y. J. G. BURROW.

Field Crops.

THE WHITE ELEPHANT POTATO.

THE RURAL has on several occasions expressed doubts about the reputed parentage of new varieties of potatoes, and has assigned therefor very convincing reasons. My own observations go to confirm what the RURAL has said in this regard. Twenty years ago it was not uncommon to see balls on the potato vines, particularly on those of late kinds, but within a period of ten years past I do not remember having seen a single ball. Although some kinds flower plentifully, yet no fruit is produced, and this arises either from some defect in the organs of the flowers or, as I am more than inclined to suspect, from a change in our climate, which has resulted from the opening out of the country. The potato cannot resist the intense heat of our Summers, and as a consequence the vines are scalded and the flowers drop off prematurely. It is now a rare thing to see the vines decay in a natural way, while at the same time large crops of the tubers are raised. For this reason it is best to make the intervals between the rows closer than we have been in the habit of doing—say two feet—and to plant either very early in the Spring, so that the tubers shall be pretty well matured before the hot weather comes on, or else late in Summer—say July 1st—so that they shall catch the cool weather of Autumn. I speak here, of course, of very early varieties. The Peachblow is the only late variety which seems able to pass our Summer unscathed.

I am inclined to believe that most of our new varieties of potatoes originate from what are called sports. What a sport is precisely, or what causes it nobody seems to know. We only know that it is a departure in one or more particulars from its original—in color, in shape, or in time of ripening. I cannot believe that potatoes, any more than other vegetables, can be crossed in any way except through the flowers, and therefore I am of opinion that a sport is an offshoot of a variety which has not entirely assumed a fixed characteristic.

Two years ago I noticed among my Beauty of Hebron vines a hill which was two or three weeks later than any other. On digging it I found the tubers much longer, larger and rougher than the Hebron, but of about the same color. I saved six of the largest, and from these I raised this year two bushels. I have just received specimens of the "White Elephant," said to be produced from a seed-ball of the Garnet Chili, fertilized with pollen from the White Peachblow. This potato and the one which I have been raising are, beyond question, the same. The White Elephant might more properly be called the Late Hebron. I thought this was the case when I saw the illustration of the White Elephant in the Fair Number of the RURAL. I am now convinced of it. I saved also two potatoes from a sport of Bliss's Improved Peachblow. This was growing by the side of a hill of Snowflakes, and at first I supposed, as the potatoes were very smooth and white, that the Peachblow and the Snowflake had crossed in some way; but, on planting the two potatoes and observing the vines, I saw they differed in no particular from the Peachblow family. The tubers of this crop are smoother and more uniform in shape than Bliss's Improved, and are white with small specks of red. HUGH L. WYSOR.

Pulaski Co., Va.

Heavy Manitoba Roots.

To show the fertility of the soil to English farmers, a consignment of roots grown in Manitoba the past season, was shipped thence. The Mammoth Long Red Mangel Wurzels weighed 75 lbs. each; the Giant Long Yellows, 65 pounds each; and the Prize Yellow Globes, 60 pounds each. The most surprising thing about these is, that they were very symmetrical in form, and of *fine quality*, without any of the coarseness usually found in roots of large size. We have occasionally grown in our own grounds here in the State of New York, roots varying from 15 to 20 pounds each; but they were so poor in quality and coarse in fiber that our stock would reject them unless very hungry. There is no doubt that more nutriment existed in the roots we grew of one-third to one-half the above weights, which our animals of all kinds devoured with avidity, either raw or cooked. England having a moister and cooler Summer climate than ours, can grow large roots of a better quality; they frequently get good ones of 20 to 35 pounds. H.

WHAT IS THE BEST VARIETY OF WHEAT?—Prof. Tracy, of the Missouri Agricultural College, has been engaged for several years in testing the comparative yields of different varieties of wheat. He has carefully tested over one hundred sorts, and not being satisfied with the results of these tests alone, desires to learn what the yields have been in other portions of the country. Parties engaged in wheat growing will confer a favor by sending him a postal card giving the names and varieties grown in the neighborhood, and the yield of each. These reports will be published in connection with Prof. Tracy's report, and a copy sent to all who render assistance in gathering the information desired. The question of what is the best variety of wheat for general cultivation is one of the very greatest importance to all, and it is one that the RURAL is hard at work to solve; it is hoped, therefore, that every farmer who reads this will forward a statement of the crops in his immediate locality.

Address: S. M. TRACY, Agricultural College, Columbia, Mo.

Farm Economy.

THE YEAR'S RESULTS IN SORGHUM SUGAR MAKING.

So far as concerns the past year's experience with Northern sugar-cane, the season has generally been of an unfavorable character, nevertheless there has been a decided progress. Better results than heretofore have been obtained by most new beginners, although some have made signal failures. I have generally dissuaded people without experience from going headlong into the business. I have been strenuously urging the necessity of experts' skill to make the production of sorghum sugar profitable, and I must still repeat that without such skill the business is seldom likely to turn out satisfactory; for in an extensive tour of observation I have always found that failures were the results of ignorance, either in the construction of apparatus or the process of converting the juice into sugar. It is true some sections have very nearly failed to get a crop of cane; but, strange to say, this crop has an astonishing vegetative recuperative power. In Kansas, for instance, where the drought had cut down all crops to the first of August, the rains that fell that month revived the cane, and a fair crop was produced, although it was not of as good a quality as it would have been under more favorable conditions of weather.

A few essential points have been settled this season. The first of these is, that the bagasse, or crushed cane from the mill, properly handled, will furnish ample fuel for grinding the cane by steam as well as for evaporating the juice. Furnaces for this purpose differ only slightly in construction from those for other sorts of fuel, and are only a few dollars more expensive. The second point settled has regard to the method of securing the cane from frost and prolonging the season of work. This is effected by culture of the crop, binding it into bundles and shocking the cane, with leaves and tufts on as soon as the seed is generally ripe. In this condition, with the tops tied, it has been standing in the interior of Kansas since the 10th of October until the present time (Dec. 14), and is now being worked into sugar, with good results. I have always favored the shocking of cane with the butts upon the ground. This is nature's position for it, and the standing of the freshly cut ends of the severed canes on the soil will prevent the action of the atmosphere that produces fermentation. The benefit of cutting as soon as ripe is shown by the fact that, if this is not done, new branches start directly from the upper joints of the cane, which may greatly impair the quality of the juice.

Another point gained this season is the development of a new variety of cane possessing greater sugar-making properties than the Early Orange, and for it the Mississippi Valley Cane Growers' Association is entitled to the credit; for it was in response to its call that a farmer in the extreme western part of Missouri sent on a single tuft of remarkable appearance, and from this has sprung the new variety which has returned some of the most remarkable results, not only in the quality of sugar, but also in the growth of cane per acre. It is somewhat later than the Early Amber, but still it ripened its seeds in Nebraska and in some places in Minnesota, while in Texas it matured in 65 days, besides being very large and rich in sugar.

Another very valuable feature in the manufacture of sorghum sugar, which is sure to be extensively established in the near future, is the value of the forage of the crop, for in all the reports received by the above Association, the seed ranks high in nutritive value. Moreover, the skimmings from the sugar works will be found more valuable when fed to hogs or cattle than the same number of gallons of milk. I. A. HEDGES.

Pres. M. V. C. G. A., St. Louis, Mo.

"Banking-Up" Houses—Ventilation of Cellars.

Mary Wager-Fisher asks (page 838) "Cannot much of the "banking-up" of the country house be advantageously made permanent?" My answer is that all "banking-up" can be advantageously dispensed with. Build your cellar walls of stone, well laid in cement, taking care that none of the stones reach through the wall; put in double windows, tightly fitted, and you will have a cellar frost-proof. The amount of time consumed in ten years in "banking-up" would build a good wall. Banking up the house is always a disagreeable and often a filthy job, discoloring the house, littering the yard, etc., and it is wholly unnecessary.

The best way to ventilate the cellar is to build the chimney from the cellar bottom, leaving a hole at the base for the escape of the bad air, and from which the soot can also be taken. Where the chimneys are already built, a ventilator running from the cellar to the chimney can be cheaply arranged. Fresh air can be admitted by the windows; or, better still, ventilators can be placed in the cellar walls. These can be opened, closed, or partially closed, as the weather varies. Plenty of light is most convenient, and promotes cleanliness. A dark cellar is almost sure to be a dirty one, and *vice versa*. NELSON RITTER.

Onondaga Co., N. Y.

Advantage of Caring for Implements.

In 1870 I purchased from R. H. Allen & Co., N. Y., a farm wagon, with hay rack; also two dumping carts all complete with iron axles and steel tires, all of the best quality. I have had them in constant use ever since, and to-day they are almost as good as new, their wheels and tires are the original ones. When not in use I keep them clean, under cover, using for that purpose the lower part of my corn crib, open on all sides, the wheels resting on planks instead of the ground. As soon as harvesting is finished and the Winter has set in, they are thoroughly cleaned, wood-work and all, and after any cracks are properly filled with putty, they get a substantial coat of paint, generally metallic, and are then ready for another year. The expenses for repairs have been trifling indeed. I do the same with plows, mowing machines and other implements and have used the most of them for many years at trifling expense for repairs, and they are in excellent condition.

Passaic Co., N. J. Wm. F. HEINS.

Apple Crates.

Crates are better and more convenient for storing apples in the cellar than barrels, because they are more easily handled, and they also admit of a free circulation of air. They may be made to hold a bushel or a bushel and a half, and they are cheaply made, too. The ends alone should be made of a whole board, (and a place should be cut out in each end to put the hand in to carry the crate by); the bottom and sides are formed by nailing on narrow strips about an inch or an inch and a half apart. If a farmer has not a supply of crates, now is a good time to make them and have them ready for next year's use. F. H. D.

Horticultural.

RURALISMS.

IN "going up and down through the earth" on the railroad and otherwise, I have been making the Winter aspect of deciduous trees a study, not, however, for the first time by any means, but I have been looking at them now in reference to the spray that adorns them after they have dropped their green garniture over their feet, as it were, to protect them from the Winter's cold. There are certain kinds and degrees of beauty in the aspect of the trees and woods in Winter, which cannot fail to interest and delight the true artist; and he who, be he artist or not, passes the trees by in Winter without a thought of their beauty or expression, deprives himself of a real pleasure. Day after day I have looked at the trees to determine, if I could, which of them all stood pre-eminent for the grandeur of its form and the beauty of its spray, and I finally decided that this pre-eminence belongs to the American Elm (Ulmus Americana). There is no time of its life, Winter or Summer, in which it is not a beautiful tree, but in Winter it is especially so. Take an old and full-grown tree, such as may be found on the college grounds at Fordham, or at New Haven, or occasionally on a lawn, or on the outskirts of the woods and elsewhere within a hundred miles or so of New York, and the Elm is a great lofty tree of marked gracefulness and grandeur. Its largest limbs have become curved or pendulous at the top, and are finely furnished with a light, feathery spray, purple-tinted, which naturally suggests the name of Fountain Elm. Take a young tree, from ten to fifteen feet high, and its feathery spray suggests a beautiful combination of plumes. Anywhere from five to eighty feet in hight, this urn-like tree is the most beautiful of all deciduous trees in its Winter dress. It is, beyond all peradventure, the best tree for planting on roads and avenues, and deserves a conspicuous place on all lawns where it can have room to develop its grand proportions, and is especially adapted to planting in public parks along the drives where shade is needed. One never knows all about a tree (for ornamental purposes at least) till he has studied it in the undress of Winter.

This little paragraph is intended for the lady readers of the RURAL who delight to grow plants in rooms. Orchids are plants that they seldom or never indulge in. They are supposed to be difficult to grow and to require a good deal of skillful care and attention, and a house built specially for them, and this is mainly true in regard to many of them, if the best results are to be attained; but it is not true of all of them. There is one terrestrial orchid which I do not hesitate to recommend to any lady accustomed to growing plants in rooms. I refer to Cypripedium insigne. It is generally supposed to need a warm greenhouse, or even a hot-house, but it is really a half-hardy plant, and does very well indeed in an ordinary sitting-room. An eastern or western window will suit it now, for while in flower it does not need sunshine, but a clear light. It should be regularly watered, but not saturated, till it has done flowering, and should never be allowed to dry up, though it needs less water after it has made its new growth. The flowers will remain good for at least six weeks, and sometimes longer. It is hardly a good time to buy this plant in Winter, unless one can be found growing in a cool greenhouse, as the sudden change to the air of a sitting-room does not always agree with the plant; still, it is worth while to buy a small plant in bud and run the risk. Of all who have tried it on my recommendation, only one has been unsuccessful. I can show a plant now with 39 flowers and buds on it, which has been growing for weeks in a night temperature ranging from 32 deg. to 45 deg. Fahr., and it looks as fresh as a daisy. Still the low temperature is to be avoided, as I find the flower stalks are not thrown sufficiently above the foliage, and this was an experiment.

Many readers of the RURAL may know the Libonia floribunda. It is one of the best of winter-flowering plants for the sitting-room, being in flower from the early part of November till the following Spring. A variety or seedling of this, named Libonia Penrhosiensis, is in most respects a great improvement upon it, and a plant worthy of a place even in a small collection; and I do not recommend a plant for room culture until I have thoroughly tested it in a room. L. floribunda produces one and two tubular flowers in the axils of the leaves, and seems to be almost covered with flowers when at its best; but the new plant, L. Penrhosiensis, produces from four to six flowers in the axil, with more red and less yellow in the color. It has darker foliage, and makes a denser growth, and what is important, the foliage is now persistent. It comes into flower a little earlier, and when the plants are quite small. It should be placed near the light, and abundantly watered; otherwise the foliage will drop, especially from L. floribunda. This is a plant that will please the ladies. I have no room for full description and culture in this column.

Last Winter the florists began to force pretty largely the Paris or Michaelmas Daisy (Chrysanthemum frutescens), for floral decoration, including especially the decoration of ladies' corsages. I noticed that some florists, not yet being provided with plants of the Paris Daisy, had recourse to the common Ox eye Daisy, (Leucanthemum vulgare) and many people do not yet know the difference. There is a yellow variety of the Paris Daisy, recently introduced, which is said to be finer than the white. I rather like this growing taste for flowers as Nature made them. This taste once established, the florist might find among our natives many a pretty plant that would "force" and suit his purpose. But it remains to be seen whether this Daisy "boom" is not mere fashion, and not a real cropping out of taste for nature's simple forms. I hope it may prove to be the latter. HORTICOLA.

ASPARAGUS PLUMOSUS.

THIS is an exceedingly handsome evergreen species, a slender, shrubby climber, indigenous to the Cape of Good Hope, Kaffirland and Natal. It was introduced to garden cultivation in Europe some five or six years ago, received a first-class certificate from the Royal Horticultural Society of London April 22, 1879,

and has but quite recently made its appearance in America. Festoon "strings" of it have an airy gracefulness unapproachable by fern or smilax, and its elegant sprayey branchlets have a lightness and brightness in bouquets and other floral work, that even Adiantum cuneatum var. gracillimum cannot equal. It is a greenhouse plant of easy culture, and, like most South African plants, would rather grow in Winter than in Summer. Ordinary light, rich soil, good drainage, plenty of water when in active growth, with a lesser supply in Summer, and a light, airy place in the greenhouse, seem to be favorable conditions for its growth. Like nearly all the other ornamental species of the asparagus, in a cut state its sprays preserve their freshness as long as smilax and longer than most ferns.

Besides the above, there are a great many species of ornamental asparagus. We have them here in the way of far-reaching, thorny climbers; shrubby, branchy roots; evergreen, arching plumes, and small, bright-green, densely-tufted, herbaceous kinds, all available for cut-flower work, lasting long in beauty after being cut; but some species are handsomer than others. WILLIAM FALCONER.

ASPARAGUS PLUMOSUS.

THE most prominent characteristic of the asparagus genus is the finely-divided, hair-like foliage, and no approach to it is to be found in any other class of plants, except the Horsetails—Equisetums. It is usual to speak of these hair-like divisions as leaves, but, though they serve the purpose of true leaves, they are only flattened branchlets, termed cladodes. The true leaves consist of grayish or brown triangular scales at the point of origin of the branches, and tufts of cladodes, which are sometimes transformed into spines.

A few of the species of ornamental asparagus are hardy, but the larger part of them require to be grown under glass, being natives of the tropics. The hardy ones, and a limited number of the tender ones, are deciduous, with erect, self-supporting stems, but by far the greater portion have slender, climbing, perennial stems, with spreading branches, some of which make elegant conservatory climbers. Their culture is very simple, their requirements being a light, rich soil, with plenty of root accommodation, an abundance of light and air, and a temperature of from 50° to 60°. They are increased by division or seeds.

The foliage of Asparagus plumosus is exquisitely fine and quite rivals in grace some of the hair-ferns. Unlike our garden asparagus, its stems have a flat, frond-like appearance. As it grows older its stems become scandent, but its lateral branches retain all the elegance of the juvenile state. There is probably no more useful plant known for associating with cut flowers, as it retains its freshness several days. It is a native of Natal.

ASPARAGUS PLUMOSUS.—FIG. 24.

Dairy Husbandry.

THE DAIRY COW—NO. 21.

HENRY STEWART.

Churning.

THE temperature of the cream and the velocity of the churn are very important elements in the process of churning. There seems to be a certain amount of agitation needed to produce the butter at a normal temperature, which I place at 60 degrees; and this requisite agitation is effected by making 60 revolutions or strokes of the churn for 20 to 30 minutes. The effect upon the cream of this amount of agitation and aeration seems to be precisely that which is required to produce the best quality of butter from cream that has undergone the necessary amount of ripening. This ripening process is effected by keeping the cream for 48 hours, on the average; that is to say, if the cream has been 72 hours, or three days, in collecting, or there have been three skimmings, its condition will be equivalent to that of cream of one skimming which has been kept 48 hours. The cream should have been gathered from milk that has been set no longer than 36 hours. If cream in a small dairy cannot be churned twice a week, being kept only three days, it should be kept at a lower temperature, not exceeding 45 degrees, until 24 hours before churning, when it should be raised to a temperature of 60 degrees for a whole day and night before it is put in the churn. As this point is very important, it may be well to repeat the rule in this case, viz.: Cream should be skimmed after the milk has been set 36 hours; it should be kept 48 hours before churning, at a temperature of 55 to 60 degrees; it should go into the churn at 60 degrees; it should be churned at least 20 minutes, and not more than 30, the churn moving about 60 strokes or turns in the minute.

This rule is subject to such changes only as will equalize the effect; for instance, if the temperature is lower than 55 to 60 degrees, the cream may be kept longer; if the cream is churned at a higher temperature than 60 degrees, the churn may be moved more slowly; and if the cream is colder, the motion may be more rapid. When there is cream enough for a daily churning of six pounds only, it is better to churn daily, and for this reason, viz., when the conditions are always the same the butter will always be of the same quality. There are two good qualifications for a dairyman—one is to be able to make good butter; the other is to make good butter always, and to have no variation in the quality at any time or season. There is a French proverb to the effect that when one excuses, he accuses himself. This is true of the dairyman or woman; and if he or she ever needs to excuse the inferior quality of the butter, there has been some fault committed.

When the butter appears in the churn in small grains or pellets the churning should stop. One can very soon learn to recognize the sound made by the churn when butter has come; yet it is well to have some other guide, and this is easily secured by fitting a piece of plate-glass in the cover of the churn. When the butter has come the glass will become very nearly clear, and the small fragments of butter may be seen upon it. Over-churning has the effect of injuring the texture of the butter and changing the waxy, almost crystalline appearance into a soft, greasy one. When the butter is in the best condition after churning, it appears as a mass of small granules loosely adhering together, but which easily fall apart when floated in cold water. These granules are no larger than the capsules of beet seed, and many of them are not more than half or a quarter as large, and when some cold water is poured into the churn to harden them, they are kept separate and do not adhere in a mass.

Butter of this form is better made in the rectangular or other dashless churns than in those with dashers, because the granules are not crushed, pressed, or rubbed, when there is no dasher used. The great advantage of this form of butter is that it can be completely freed from buttermilk, and can be washed, salted and packed into pails or tubs, or made into cakes, without any working. When the buttermilk is drawn off, a small hand strainer should be used to catch any of the small fragments that may run off with the milk. After the milk is run off, cold water is put into the churn until the butter floats; the churn is slightly moved to bring the water into contact with all the butter, and the water is drawn off. This is repeated until the water comes off perfectly clear, when the butter is ready for salting. This may be done in the rotary churn without removing the butter, as the butter and salt may be thoroughly mixed by giving a few turns to the churn. When other churns are used, the butter is lifted out with the ladle—it should never be touched by hand—into the bowl or butter-worker and mixed with the salt in the usual manner.

Sheep Husbandry.

SHALL WE BREED DOGS OR SHEEP?

SCARCELY a week passes but the papers have an account of some dog killing many sheep and maiming many others. Every year there is scarcely a sheep keeper who does not suffer more or less loss caused by dogs. The greatest damage is due, not to the number killed right-away or so maimed that they die afterwards, but to the terrible scare received by the other portion of the flock, from which they never fully recover.

Recently I passed through Connecticut and other portions of New England and saw thousands of acres only good for pasture and better adapted to sheep than to any other stock. When, however, I asked my companion how many sheep were kept, he commenced by telling how many were kept years ago, but said that lately the dogs were so bad it did not pay to keep sheep, and there were scarcely any. Those thousands of acres of rough pasture lands would keep many thousand sheep and produce vast quantities of the very best and most healthful kind of meat, and many, many thousand pounds of the very finest wool, thus adding largely to our national wealth, and going far toward making farming profitable in the older States with their hilly lands; but now they are rendered worthless, and, worse, are allowed to grow many noxious weeds, the seeds of which are scattered broadcast over the adjoining fields, all because we persist in growing and allowing others to grow a lot of entirely worthless curs.

The experience of New England is not very different from that of all the older-settled portions of our country; many townships to-day can count more dogs than sheep. How strange it is that a people so very intelligent and money-making as we claim to be, should think more of dogs than of sheep, and be willing to sacrifice the latter for the former.

In our towns the authorities are very careful—and justly so—to pass laws restraining cattle, hogs, or even geese from running at large, and employ an officer to enforce such laws, and yet the streets are infested with hundreds of vicious, worthless dogs, barking at every passer-by, and often making such streets dangerous to smaller children. Every town is a pest to the surrounding country by reason of the large number of dogs that run abroad from it, making it impossible to keep any sheep within miles of its outskirts. Now what shall we do? Shall we calmly submit to the existence of this great nuisance? Shall we go on importing annually millions and millions of dollars' worth of inferior foreign wools and let our hills and rough lands lie waste? Or shall we arouse the people and exterminate the dogs? I am aware that we now have laws designed to protect the sheep raiser, but in this county—and I presume it is so in every other—the dog fund (so called) is so grossly deficient that there are now more claims against it than can be paid in ten years, if not another sheep should be killed in that time—and yet the dogs are multiplying greatly each year.

I think this a question of great importance, and that it should be much oftener discussed in the public press. Public attention should be fixed upon it, and our law-makers should be urged to protect the farmers by the passage of some very stringent laws; such laws, as shall fully protect the sheep owner from, and remunerate him for, all damage by the ravages of dogs.

I am willing to concede that the dog is man's friend and companion in boyhood, and that we become attached to him, and, everything else that can be honestly claimed in his favor; but when it comes to a question of *no dogs* or *no sheep*, I must place myself on the side of the sheep, and if necessary insist on the extermination of the *last dog*. J. S. WOODWARD.

To Prevent Sheep Getting over Stone Walls.

A great many men who have farms excellently adapted for keeping sheep, are deterred from doing so on account of their farms being fenced with stone walls, and sheep will soon learn to get over any ordinary stone fence. The cheapest and at the same time the most effectual device for preventing this is one gotten up by a neighbor of mine. It consists in setting posts against the wall, boring a hole through these about sixteen inches above the top of the wall and running a No. 11 wire through the holes. This should be stretched very tight. If the first end is well fastened, this may be done with a crowbar for a long way, using the bar for a lever. The posts need not be nearer to each other than four to six rods, if the top of the wall is straight; if it is not, they should be somewhat nearer. This he has found to be perfectly satisfactory, so much so that a neighbor's big dog tried to get over it to the sheep once or twice, and went away perfectly disgusted. A much neater and more durable plan, costing but little more, would be to insert small iron posts into the cap-stones at proper distances and bend the posts so that the wire will hang directly over the face of the wall on the side on which the sheep run. Either of these methods costs so little that the profits of a small flock of sheep would more than pay the expense in one season. W. E. M.

Wallsville, Pa.

The Poultry Yard.

THE BREED FOR BROILERS.

L. S. HARDIN.

THIS is a subject that may be treated theoretically or practically. The authorities generally take the former view of it. The whole burden of their song is quality of flesh. To obtain this they choose the breeds that make the tenderest and most juicy grown fowls, and propose crosses between them, such as a Dorking cock on a La Fleche hen, thus combining all the tender qualities of these two tender breeds. Then what is the practical result? You obtain a chicken so extremely tender that it is the next thing to impossible to raise it at all. Along with the crossing of these tender breeds, they advocate feeding on milk oat-meal, and custard, until they reduce the flesh of the broiler to the tender consistency of underdone mush.

The fact is, one of the hard points in making first-class broilers is to get a sort of flesh not only tender, but sufficiently firm to furnish a relish. Then, again, it is useless to advocate a certain cross of which one must hatch out a hundred to raise a dozen. The practical poultry breeder, the one who hopes to make a profit on his fowls—and he is the one in whom we feel the deepest interest—wants a bird that will not only satisfy the purchaser, but return a fair profit to the breeder.

To get at the gist of this subject, we must, first, consider what are the hardest points to overcome in raising broilers, and then master or avoid them. First, then, in order to receive the highest price, one must bring the largest yield of stock into the market in early Spring. When hens alone are depended on for the necessary incubation, procuring the chicks at the right time will be the main difficulty, for

It is their very scarcity that makes the high prices for broilers at this early season. To overcome this difficulty the only remedy lies in a good incubator. I say "good," for there are numerous poor incubators on the market, and a good one can get as many chicks out of 100 eggs as a poor one will out of 500. Keeping the point of profit strictly in view, we must keep an eye on the eggs. At this season of the year eggs are scarce and high. It requires a great deal of time and trouble to get enough of them to keep a large incubator running. Then when they are got, if they are from ill-assorted fowls, only about one-third of them will hatch, and of those that do hatch a large percentage will die before they are ready for market. These weak points make a serious inroad on the profits, which may be avoided by raising eggs yourself, and from fowls so mated that weakness of the chick may be avoided. In accomplishing this end the first object to be attained is that of constitution in the parent fowls, and by this I do not mean large, strong hens and cocks, but those sorts that produce chicks capable of weathering rough usage. It is a peculiarity of many breeds, such as Dorking and Spanish, that while they are as hardy as most breeds after they become fully grown, yet as young chicks they are unusually delicate and hard to raise. Chicks from these breeds are, therefore, manifestly unfit for broilers, no matter how excellent the flesh might be after they have once reached the age of broilers. To make money we must have quantity as well as quality. The flesh of a young broiler is naturally so tender that I do not think breed of much moment in this respect. The quality of flesh in so young a bird is much more dependent upon the quality and adaptability of the food consumed than on the breed from which it has sprung. With proper feeding we may, therefore, safely abandon the breeds of fine flesh and choose our breeding stock from those alone that have other and more desirable qualities.

I believe, take it by and large, the common dung-hill fowl is hardier than any other breed when young. Born and nurtured for generations among the vicissitudes of farm life, having to-day a feast, with all the doting care and lavish abundance of some boyish fancier; to-morrow forgotten, totally neglected, and thrown unexpectedly on their own resources, they invariably rise above the occasion and the poultry fence; force their way through the thickets of environing hedges, and forage with a soldierly instinct on the fields alike of friend and foe. This self-reliance is so bred into our native stock that its good qualities crop out at an early age in the chick, making it enterprising, self-reliant and hardy. Here, then, we have constitution—a good foundation for stock.

The flesh of a white chicken always looks better than that of a black one, owing to the black pin-feathers that cannot be removed. I would, therefore, choose strong, healthy, light-colored, native pullets. To these points, one should add in the offspring size and quick growth, while detracting as little as possible from the rugged constitution the native hen gives the chick. I would also keep the color of the cock white, and with all these points in view my choice falls upon the Light Brahma—not the long-legged, fluffy-feathered, ostrich-like strains that are so popular at the poultry shows, but "disqualified" birds; those that stay near enough to earth to keep out of the realms of fancy and the show pen; strong, short-legged, stocky birds, with plenty of white on the body and prominent breast-bones. They can have pea-comb and striped hackle or not, just as they choose. I would put one of these cocks with five or six hens in flocks of not over thirty. The pullets should be not over three years old to be profitable layers. The cocks should be young enough to be vigorous, so that all the eggs may be properly fertilized. Without having, thus far, been able to determine the matter experimentally, it is my opinion that if one tread fertilizes three eggs, then if the hen receives no more, the first egg will hatch a vigorous chick; the next, if skillfully handled, will produce a weak chick; and the third chick will die in the shell when more or less formed. My experience thus far points to such conclusions. With the above management one will secure quick-growing, healthy chicks, and thus the battle is half won. The Asiatic blood from the Brahma causes the chicks to feather slowly, and while they have the objectionable and slovenly feathers on the legs, they have not those long wing feathers that cause the little chicks to droop around and finally die. I have found it highly beneficial in such cases to cut the feathers off and thus relieve the little things of the awkward feeling that seems to trouble them.

In raising stock to replenish the breeding hens I would procure eggs from farmers, and pay only moderate prices for disqualified cocks of pure blood, getting them from those near enough to allow of my personal examination of the birds before purchasing them, if possible. The quickest-growing of the pullets may be reserved for the breeding pens, but let every cock go to market. It is a waste of time and labor to work with a half-bred male bird. Then anything like in-breeding will raise the mischief with our fundamental principle—good constitution. Every element of weakness should be religiously eliminated, and for this reason cocks from circumscribed walks should be rejected. They should have a firm, elastic step, free from the slightest tendency to leg weakness; for this trouble, if inherited, will surely crop out in chicks that are forced in small pens with rich and abundant food.

WOMEN SHOULD RAISE POULTRY.

THE raising of poultry may be called a domestic art pertaining immediately to the occupation of a woman. A hen to a man is a fearfully fretful creature. Most men cannot stand the noise and especially the unceasing motion and nervous restlessness of their own children, much less the perverse love of mischief in a cunning old hen. Some one tells an amusing story of a man trying to drive a sitting hen back to her nest. After two or three ineffectual attempts he makes up his mind that she shall go in—and what a time they have of it! Over the porch, under the house and into the garden she goes; old shoes, bits of wood and tin cans follow her at every turn, while he yells and she cackles until he gives out exhausted, wipes his saturated face, puts on his coat and goes down town to his legitimate business of quarreling over "trades" and bossing the clerks. Now, see how easily his wife handles that hen. She approaches the hen gently, calling her and offering a little feed; as soon as the hen understands there are no more missiles to be feared she quiets down and with a few gentle wavings of the lady's skirts and a "Shoo, biddy!" the hen quietly walks to her nest. And thus it is all through the business of raising chickens. Woman's gentle, watchful care is of particular value in raising the little creatures that are so tender and frail. A motherly affection for them suggests methods for their protection or cures for their ailments, that never would cross a man's mind. Raising poultry is generally believed not to be profitable; neither would raising babies be profitable if men had to do it. There is no earthly reason why any woman of fair executive ability should not make money—and plenty of it—if she would only go at the undertaking in a business like way. The greatest branch of profit is in Spring chickens, just where her domestic powers would come best into play.

The Apiarian.

"DO BEES PUNCTURE GRAPES?"

Under the above caption a correspondent in a late number of the RURAL states that he has "noticed that bees made a puncture in the berry, and afterwards the wasp finished it by eating everything inside "except the skin and seeds."

Now, it so happens that the honey bee could not well make a "puncture," except with its sting, and I am sure that if this observer had really seen a bee puncturing grapes with its sting, he would have noted that fact and given it some prominence.

The correspondent further states that his grapes had not been molested for three years before this last season, but he thinks that now that the bees have had their "first taste they will, perhaps, next year come in swarms," when few grapes will be left, etc.

I desire to call attention to these statements as illustrating how easily one may be mistaken as to what he may have seen of the work of so small a thing as a bee, if he does not observe closely and take due account of certain well known facts.

There are many people who, having seen bees at work upon their grapes, have naturally inferred that they were the sole cause of all the mischief done, and a few, therefore, considering them a pest, have undertaken to poison them, a proceeding of doubtful justification even if it could be clearly shown that they do sometimes attack and destroy sound grapes.

The past season the bees worked upon my grapes when I took occasion to examine their work very closely to see if they made use of their mandibles to gnaw into the sound grapes, but no such use of them was detected. Their tongues were, however, used freely in licking up the juices of the ruptured fruit. They would run over and about the clusters as if in search of some opening, nor would they relax their activity until an unsound grape was found, when immediately the tongue was presented for use. I doubt very much if they ever make use of their mandibles in the act of gathering any kind of sweets.

It is well known that the cat-bird, blue-jay and brown-thrush are very destructive to grapes, and since they often live several years,—unlike the honey bee, whose life is only for a few months at best—they may profit from previous experience. It might be well, therefore, for persons complaining of their grapes being "punctured," to keep a sharp look-out for birds.

The rupturing of my grapes the past season may be readily and truly, as I believe, attributed to the continued very warm weather, frequent rains, and very damp atmosphere while the grapes were ripening, and afterwards. These were conditions favorable to a rapid growth of vegetation and to an active absorption of fluids both from the earth and air. Too rapid a growth of the grapes, or a superabundance of their juices occurring before or after ripening, was the direct cause of their rupturing.

I had also an early apple tree that was loaded with small but mild-flavored apples. They ripened about the middle of August, and the weather being as above described for several weeks, they nearly all cracked open, when the tree became full of bees and wasps every day as long as the apples lasted.

It is therefore apparent that bees will work upon unsound grapes and apples, but the very interesting question whether they ever injure or destroy sound, ripe fruit of any kind, does not, as yet, appear to be established by any decisive evidence. G. L. T.

New Philadelphia, Ohio.

BASSWOOD FOR HONEY.

PROMINENT bee-keepers both in the Eastern and Western States are advocating the cultivation of the Basswood (Tilia Americana) for the purpose of increasing the sources whence the honey bee may obtain honey of the first class. The Basswood is quite common in our forests, and is hardy, bearing transplanting remarkably well. Set out near the farmer's home, this stately tree, with its flower clusters fragrant with rich odors, becomes a source of pleasure as well as profit, and the busy bee, ever on the lookout for the sweet, "nectareous juice" will amply repay the farmer for his trouble, with increased honey stores.

The honey gathered from this source is equal to that obtained from white clover, being white in color and of a rich flavor; indeed, it may be said to have no superior. The Basswood blossoms soon after the white clover begins to fail, so the period during which the best honey may be made is extended very much. The greatest yield of nectar from this tree is from about the middle of July onward for two or three weeks. In vicinities where it abounds, swarms issuing as late as July 15, have been known to fill their hives. The tree yields profusely, the flowers seeming, indeed, to be dripping with "liquid sweetness."

An eminent apiarist, by taking advantage of circumstances, in moving a number of colonies to higher ground where the Basswood trees did not blossom for two weeks after those in the valley had failed, secured, during 40 days after the first blossoming of the Basswood, 10,000 pounds of surplus honey from an original colony of 100 swarms. He, also, has seen 25 pounds gathered in one day by a single swarm. Hence, experience shows that the general planting of these trees near apiaries, would have a strong tendency to increase the supplies of honey, and that, too, of the very richest and most delicious quality, and wherever the Basswood can be grown with success, I would recommend its culture, as making a worthy addition to our many excellent honey-producing plants and trees. J. W. D.

The Swine-Herd.

BREEDERS.

COL. F. D. CURTIS.

BREEDING for fancy and breeding for profit are different standards. In the one case, the eye is to be pleased, while in the other, taste may be sacrificed for utility. The fancy breeder generally does not consider expense, provided his notions are gratified, and these notions are so varied that any practical standard would be useless; but, *per contra*, the more practical a standard may be which contains a margin for profit, the more valuable it will be. Every breed has its advocates and every breed has its value. In making choice of breeds, the breeder should be governed by the circumstances which surround him. Locality is an important consideration. Another, more so, is the use which he intends to make of the pork when fitted for market. A large hog will convert more corn into pork than a small one, and on this account at points remote from market when corn is cheap, the former is an auxiliary which may be used to change a corn crib into a smaller compass and reduce the cost of freight. A large hog does not sell the best in market. The small and chunky hogs which make up several breeds are too fat, or rather lack lean meat, to be desirable either to cut up fresh, or to pickle.

For general purposes a medium-sized hog will be found the most profitable. Hogs of this sort will mature soon enough, and are fitted for the stall or the barrel. Such hogs may be had by crossing with all of the different breeds, and a proper selection of breeders. Coarse and fine hogs bred together, will usually produce those of medium size, but this is not an invariable rule; for in the same litters may be found pigs with the forms and characteristics of both parents. A sow with a long body and good bone is the best mother, and, if crossed with a male of fine bone and more compact form, the offspring will be found to be as nearly perfect for profitable feeding as pigs can be reared. This is a general law and applies to all breeds or to animals of no special breed. To get this class of pigs does not require a special strain of blood, but special strains of blood possess certain well-defined characteristics which will make such crosses more valuable, or less valuable, as the case may be.

In hot climates a cross of natives upon hairless breeds would not be judicious, or in cold climates either; as the characteristics of no hair, or scanty hair, would surely mark some of the progeny. Where hams and bacon are wanted crosses should be made upon the breeds which carry the most lean meat. A female which will make a good breeder will show the qualities when quite young. There will be length and depth of body, with well-developed udders, and these running the full length of the body. The hair should be soft and the skin pliable. The softer and brighter the hair, and the more elastic the skin, the better will be the capacity of the animal for producing milk. A female of the above description will be sure to produce large and healthy pigs, and take good care of them, if nature's laws are not violated in her case. A sow with a roomy body always bears young much larger than one more compact, and this fact is of much importance in giving the young ones a good start, which it often takes those not so fortunately bred two or three weeks to attain. They can never equal them, either in growth or size.

Some people argue that a small sow eats less than a large one. This may be true, but she also produces less. There is but little difference in the wintering cost of a mature hog on account of the size. It is not equal to the difference in the productive value. An old sow, or one matured, is much to be preferred to a young one, as the cost of keep is no more; that is to say, a mature hog may be kept as cheaply as a growing one, for the reason that the matured one does not require such substantial food, if it needs as much, which is doubtful. A breeding sow fully grown will usually have double the number of pigs a young one will produce, and they will be double the size. Breeding sows should never be fat, nor do they want to be fed to make their full growth. This condition should be left until fattening time. To be in good heart, and lean enough to be active is the proper condition.

Industrial Societies.

MEETING OF THE CONN. BOARD OF AGRICULTURE.

[Rural Special Report.]

PROF. W. O. ATWATER of Middleton spoke on the

Rational Side of Farm Life and Practice.

He began by giving a bit of history of a rural district in New England, where of quite a number of promising lads nearly all had deserted the old homes and left the farms and gone into other occupations greatly to the detriment of their old town and their old homes. This was only one out of thousands of instances showing how New England has been depleted. Now, what can be done to stay this course of depletion? Evidently we need something which will better satisfy the aspirations of Conn. farm boys and girls. The old treadmill course does not satisfy their cravings. We need schools, county schools, and high schools, that will *fit*, and not *unfit* their pupils for the pleasures and duties of farm life. Natural laws need to be studied and scientific investigations made whereby new interest will be given to the farm. Further accurate experiments need to be carried on whereby the farmer may know how to attain the best results with the means used and capital invested. Farming should be an occupation requiring the *intellect* as well as the *hands*. The farmer should be able to avail himself of the ablest researches and best appliances to secure the highest results. Any one who has $100,000, which he wishes to do the most good with, might devote it to some school of agriculture and experiment where the grandest results might be realized for the good of the tillers of the soil.

A very valuable paper was given by Sec. T. S. Gold, of the Conn. Board of Agriculture, on

Farmers' Clubs.

These were said to be of wide adaptation, from the county farmers' club, as in New Haven Connty, to the little district club in the school district. In connection with some is an agricnltural exhibition; others are merely for discussion of farm topics. Their organization is simple. The farmers' club in West Cornwall was mentioned as an instance. This club was organized many years ago, and has had meetings once in two weeks in Winter, adjourning over in Summer, and has had the following plan: Usually it has met at farm houses, all being invited, males and females, the gentlemen meeting in one room and ladies in another. The former discnss the question of the evening, while the ladies have a social time. At 9 P. M. the whole unite in eating apples and nuts (no more is allowed), and then the company adjourn to the next time and place. This club has had a successful exlstence for more than a generation. The farmers' club of Woodstock, Conn. was also instanced as one of the most useful of our clubs. It has a hall, library, cabinet of curiosities, a microscope and, thanks to Dr. Geo. A. Bowen, the club has been a grand success. Mr. Gold thought that no organization accomplished as much so cheaply as farmers' clubs.

Dr. Cressy spoke in the evening on "Facts and Fallacies in Veterinary Science."

On the 2nd day of the convention at 10.30 A. M., Prof. Beal spoke on

Our Schools of Agriculture.

He gave an account of the course of study at the Michigan Agricultural College, and more particularly of that in his own department—Agricultural Botany. His one great distinctive idea was that in the study of the natural sciences we should be close students of nature rather than memorize a text book. To this end he has had his students investigate nature in the vegetable kingdom to the utmost of their opportunities.

One mode mentioned was this; the class are each to take a branch of a tree and give it close study; at class exercise each is called on to state what he has discovered in his study of the branch until the subject has been well considered. So likewise in regard to fruits. Comparisons like the following are made: what is the difference between the Scotch Pine and Austrian Pine; the Black Spruce and Norway Spruce; the Butternut and the Black Walnut. At the Michigan Agricultural College students are employed at eight cents per hour for labor. About one in 15 makes a good foreman. Scholars are employed in the barn, as well as in agriculture and horticulture; also on the drive-ways, hot-beds and in the wild garden, experiments, etc.

In the literary colleges about one to three per cent. become farmers; from 212 graduates of the Michigan Agricultural College 86 have become farmers; 13 are professors in agricultural Colleges, while others are occupying other positions of influence in society. Altogether 1,300 students have taken a complete or partial course of study there, and of these most are farmers. The professors of the college do considerable work at Farmers' Institutes; of these about six are held during the year. Each of these is attended by from 600 to 1,000 listeners. Prof. Beal spoke of the educational work among farmers as advanced by farmers' clubs. These he thought good, but among Michigan farmers, Granges have done far more. Farmers' clubs there are few in number; Granges are found by the hundred. The Professor is himself a Granger. Many members of farmers' clubs look upon the Grange as a secret society; but there is no doubt it has done very much to help the farmer.

Dr. Sturtevant gave a lecture on

Thoughts on Agricultural Education.

He strongly urged the advisability of a good, thorough, practical and scientific education for the farmer. In the common school there should be object lessons or teaching from nature. He thought the prime object of the farmer should be to make money and better his condition. Education should enable him to improve his own condition and that of his family. The speaker thought that some ideas in vogue as to the desirability that agricultural colleges should be paying institutions pecuniarily, were false notions. A paying college farm shows a lack of instruction.

In the evening Professor S. W. Johnson spoke on

Systematic Agricultural Education,

as adapted to the American farmer. His lecture treated the subject grandly and was one of his best efforts. The idea that anything would suffice for the farmer was thoroughly refuted. The farmer should have a thorough systematic education. We should have the ground-work laid in the lower schools; then the superstructure built up in higher schools or in those of a middle grade, and then in those still higher. The speaker also gave an account of the foreign schools of agriculture as compared with ours, showing how much less we are doing for the higher education of the farmer than we should do, or than others are doing.

On Friday the 17th Mr. Gold, the Secretary, read an interesting paper on Agricultural Societies by Prof. Brewer of the Sheffield Scientific School.

Connecticut has probably in proportion to her population as many agricultural organizations as any State in the Union, and some of her farms are yielding a product which would have astonished the grandfathers. One thousand three hundred barrels of onions have been raised from a single farm besides potatoes, corn, grapes, strawberries, pears, hay, etc., amounting, in all, to from $6,000 to $8,000 per annum. On another farm a modest little dairy-house turns out annually 8,000 pounds of gilt-edged butter whose value is $2,500. On another the poultry house, *from eggs alone*, at common prices brings in the snug little sum of $250. These are only instances of what many farms may do, and will do in the near future. In the product of orchards and small fruits a wonderful advance has taken place, and the most encouraging thing of all for Connecticut farmers is that the best markets in the world are close at hand.

A most valuable and highly interesting paper was read by J. M. Hubbard, of Middletown on

Self-Education as a Necessity for the Farmer.

The leading idea was that while the schools may do much, the individual man must do still more. He held that the farmer must read, think and investigate. He didn't believe in having a job of manual labor for every rainy day, but he thought the farmer should take such times for reading and study. Mr. Hubbard is a plain, practical farmer, a good farmer, a good citizen and a man capable of filling any position the State has to offer. The time has come when we need not feel that the legal profession must fill all the higher positions. Conn. has just called one of her best mechanics and business men to the gubernatorial chair. We have plowmen who would adorn the same place with dignity and honor. We must honor the profession of agriculture with skill and intelligence and it will surely honor us.

J. B Olcott, of the Hartford Courant, read an admirable paper in the evening of the last day on the

Agricultural Press.

It was listened to by a full house and frequently applauded. Among all the educating influences of the day he considered none should be more heartily sustained and encouraged than the agricultural press. Mr. Olcott made some very humorous illustrations and brought a most interesting course to an appropriate end.

Scientific and Useful.

THE POWER OF WOOD-LAND TO HOLD WATER.

PROFESSOR F. H. STORER.

With the view of gaining more precise knowledge than we now possess of the well-known capacity of wood-land to absorb and retain water, Riegler, in Germany, has studied the comparative absorptive power of various kinds of leaves and mosses, by subjecting weighed quantities of each of them to the test of experiment. Cylindrical tin vessels, provided with sieve bottoms, were charged to the depth of three inches with the materials, such as rakings from a beech-wood, rakings from a fir-wood, bog-moss, etc.—all taken in the air-dried condition and pressed moderately firmly into the cylinders. Measured quantities of water were poured, in a fine stream, upon the materials day after day, and the amounts which trickled through each of the layers were caught and measured. The results of some of these trials are given in the following tables. It should be said that 500 parts of water, representing a rainfall of four-tenths of an inch, were poured upon the materials every day, in each instance.

RAKINGS FROM A BEECH WOOD.

	Water absorbed.	Water that trickled through.
1st day	99.7	400.3
2nd day	114.4	385.6
3rd day	165.2	334.8
4th day	146.1	353.9
5th day	97.0	403.0
6th day	25.6	474.4
7th day	34.6	465.4
8th day	12.4	487.6

RAKINGS FROM A FIR WOOD.

	Water absorbed.	Water that trickled through.
1st day	58.7	441-3
2nd day	54.9	445.1
3rd day	59.6	440.4
4th day	50.6	4 9.4
5th day	46.5	453 5
6th day	10.6	489 4
7th day	4.0	496.0
8th day	0.4	499.6

BOG-MOSS (SPHAGNUM).

	Water absorbed.	Water that trickled through.
1st day	284 0	216.0
2nd d y	394.4	105.6
3rd day	444.1	55 9
4th day	215.6	284.4
5th day	124.1	375.9
6th day	90.6	409.4
7th day	13.3	486 7
8th day	6.5	493.5

It appears that of the first day's sprinkling the beech litter absorbed about 20 per cent., the fir litter about 12 per cent., and the moss nearly 57 per cent.; or, calling the sprinkling equal to a rainfall of one inch, eight-tenths of it ran through the beech litter, nearly nine-tenths through the fir litter, and but little more than four-tenths through the moss. On the second day the absorptions were respectively 23, 11, and 79 per cent. In these experiments care was taken that the water should fall gently upon the litter. Other trials had shown, as was to be expected, that when the water fell somewhat forcibly upon the materials a larger proportion of it ran through, particularly through the layer of dry moss.

The figures above given enforce the lesson that the absorptive power of moss and wood-litter is by no means at its best when the materials have once become thoroughly dry. In order to attain the most effective absorption the moss, etc., must already be somewhat damp. One reason why this is so is that a quantity of air clings to the dry materials and hinders the water from immediately coming into thorough and complete contact with them. In case the leaves, or what not, press upon one another rather closely, or if the material swells up when moistened, the impaction hinders the water from flowing away, and so helps to retain it. Applying these facts to ordinary experience, it appears that many a woodland must absorb a smaller proportion of the rain which falls upon it after long-continued hot, dry weather than of that which falls when the litter is somewhat moist.

The Naturalist.

THAT WOODPECKER.

T. H. HOSKINS, M. D.

Gen. Noble's head is "level" when he calls upon the writers for the Rural to give its readers facts and not guesses. (And right here is a good place to thank the General for giving us, in the Rural of May 1, 1880, the facts about the Vergennes Grape, which promises to be a valuable addition to our list of choice fruits.) Regarding the woodpecker, commonly called "sap sucker," and which is noted everywhere as producing symmetrical circles of holes in the bark, not only of apple trees but of birches, poplars, firs, pines, cherries and several other species, both evergreen and deciduous, I will state a few facts observed by myself and others. Firstly, he is not the "bluggy"-headed kind. He is the "yellow-bellied," and is not strictly a *wood*-pecker, but a *bark*-pecker. He never digs insects out of rotten trees, and couldn't if he tried, because he hasn't got the right kind of tongue for the trade. The true woodpeckers which we hear "tapping the hollow oak tree," have tongues barbed at the end, which they thrust into the holes they make with their bills, and therewith draw out the insects, somewhat as a corkscrew draws out a cork. I know of no species of woodpecker which takes out worms from living trees. The locust and the aspen poplar are badly injured and often killed by boring grubs, as well as the apple and the peach, but if these grubs are sought for or extracted by any bird whatever. I have not in a somewhat long life surrounded by orchard and shade trees in whose preservation I have been deeply interested, yet discovered the fact.

The so-called "sap-sucker" pecks holes in the bark of living trees only. These holes are made around the trunk or a large branch. They are about a quarter of an inch in diameter, and the same or a little greater distance apart, and the rows, one under another to the number of six or more, are about one inch apart. The holes never extend into the wood, and are excavated laterally, so that the cavity is widest at the bottom. The great number of species of trees, both evergreen and deciduous, upon which these attacks are made, renders it highly improbable that the bird is after an insect or worm of any kind. We know of no insect that deposits or inserts eggs in so many species or in such circles and ranks as are represented by the "sap-sucker's" holes, nor do we ever note ravages such as worms hatched from eggs so deposited might be expected to make. On the contrary, this bird invariably attacks what appears to be perfectly sound and healthy bark. Great injury is inflicted by these attacks, both upon orchard and forest trees. The White Birch is frequently killed, and an apple tree badly pecked, ceases to bear for several years.

What the purpose of this bird, in making these excavations in the green bark of trees, may be, has been a matter of doubt and discussion among observers. The systematic ornithologists have confined their attention mostly to peculiarities of structure with the view to classification, and very few of them are able to give information of value to farmers about practical questions affecting the character of species in regard to their helpfulness or harmfulness upon the farm. The general assumption has been that all birds are useful, which is about as nearly right as similar claims set up in favor of quadrupeds would be. Generally a tirade of abuse meets any farmer who undertakes to protect himself against birds, or even writes disrespectfully of the doings of the feathered race. "Fool" and "brute" are the best epithets he is likely to escape with. Nevertheless we are obliged to exterminate rats, mice, squirrels, foxes, wolves and bears; and fruit-growers find that none of these do more damage to property than birds of various species.

The "sap-sucker" is an unmistakable nuisance. Yet there is good reason to think he is not rightly named. There is no evidence that he sucks the sap of the trees whose bark he perforates. I have held the opinion that he lives upon the inner bark, which I have never found upon the ground beneath the trees where I have seen him at work, but which is found in his crop. Recently several observers (Rev. Henry Fairbanks, of St Johnsbury, Vt., being one of them) have advanced the opinion, based upon observation, that these holes are made for the purpose of attracting insects upon which the bird feeds. This would seem to argue an incredible amount of intelligence, yet it is stated as an actual fact of observation by Mr. F. and other observers that the "sap-sucker" really makes his rounds from one freshly pecked tree to another to secure the insects which are attracted by the juices exuding from the wounds he has made. Here end my "facts." Who will add to or amend them?

Orleans Co., Vt.

The Woodpecker, according to ornithologists, has a long, straight, wedge-shaped bill, with flattened and truncated tip, and sides more or less ridged. It has two toes before and as many behind, furnished with sharp claws which enable it to run up a branch with the greatest ease. By one set of muscles the tongue is thrust out far beyond the bill, while another set draws it back. Its surface is covered with a glutinous matter, a fresh supply of which is furnished by a couple of glands every time it is drawn in. The tip is also horny, with several barbed filaments pointing backward to retain insects too large to be captured by the viscid secretion. They are very active in the woods and forests, constantly tapping the surfaces of trees to discover soft or rotten places in which are lurking the insects and their larvæ which form their principal food. There are hundreds of species of them, but the most common in this country are the hairy woodpecker, the ivory-billed woodpecker, the black woodpecker, the three-toed woodpecker, the red-headed woodpecker, and the flicker or yellow-shafted woodpecker.

Educational.

MISSISSIPPI AGRICULTURAL AND MECHANICAL COLLEGE.

This college was opened on October 6th, with 160 students. The number has already increased to 230, and more would come if room could be provided. The faculty at present is as follows:—Gen. S. D. Lee, President; G. S. Rondebush, Professor of Literature and English; R. F. Kedzie, Professor of Chemistry; F. A. Gulley, Professor of Agriculture; Dr. D. L. Phares, Professor of Biology; Lieut. E. Bolton, Commandant of Students and Professor of Mathematics; Dr. Sullivan, Superintendent of Preparatory Department; T. B. Bailey, Professor of Languages; Messrs. Harper and Rondebush, Instructors. Professors Kedzie and Gulley are from Michigan and graduates of the Michigan Agricultural College; the remainder of the faculty are Mississippi gentlemen.

The course of study is modeled after that of the Michigan Agricultural College, including the manual labor system. All students will be compelled to labor from two to three hours per day on five days in the week. Owing to lack of funds the Mechanical Department will not be opened during the coming year, but as soon as possible it will be fully equipped.

The college farm comprises 800 acres of land, of which 600 are cleared and can be cultivated.

The farm is destitute of buildings and fences, but as soon as lumber is procured these will be erected, and entirely by student labor, with the exception of team-driving and the necessary superintendence of the work by a foreman. All labor at the college will be performed by students, even to building the barns and other rough work. After the Mechanical Department is started it is expected that the college buildings may be put up by students as fast as needed, and that the making of furniture, repairing, etc., can be done in the college shop. Students will receive a thorough course of study in the sciences and English, and in the theory and practice of agriculture and the mechanic arts.

The college has opened with flattering prospects, is popular with the people, and numbers among its students the sons of some of the wealthiest and most prominent men of the State. It is located at Starkville, Oktibbeha County, on a branch of the Mobile & Ohio Railroad. The country around the town is high, undulating and healthful, making the location all that can be desired. Contrary to the opinion I heard before coming South, I find that Southern boys are not afraid of manual labor or study. Owing to the lack of schools, many of our students are backward in their studies, but from the way they go to work I can see they have the right stuff in them to make good men.

Starkville, Miss. F. A. GULLEY.

Miscellaneous.

JOTTINGS.

Pot-grown Vines.

I noticed Horticola's Ruralism on pot-grown vines, Henderson's rejoinder, and Horticola's explanation. Now, if a vine grown in a pot is superior to one grown out of it, why is it so? and in what respect? I am so much of a novice (!—EDS.) that I would like to learn the why and the wherefore. Does a cutting grown in a pot make more or better roots, or will they be in a more natural position than if grown otherwise.

I have grown a good many vines and I know there is a good deal of difference in varieties in the way of making roots, and often in vines of the same variety. I have set vines grown in pots, the roots of which had run round the pots till they assumed a corkscrew shape and were difficult to straighten out, but it never occurred to me that such plants were any better for having their roots in such a shape.

If pot-grown vines are really better than others let us know why and in what respect.

Plainness of Speech.

The friendly criticism of your correspondent on the abstruse expression of ideas by writers for the press, as quoted in "Brieflets," in a late issue, is very apropos. He hits the nail on the head squarely and deserves the thanks of all for so doing. An idea may be perfectly plain to the writer when written, but if afterwards he were to put himself in a position of one unfamiliar with the subject, and re-read it with a view to ascertain whether it was perfectly plain and free from any ambiguity to others, changes would be very frequent. "You know how it is yourself."

KIT.

THE TRUTH ABOUT IT.

[THE object of articles under this heading is not so much to deal with "humbugs" as with the many unconscious errors that creep into the methods of daily country routine life.—EDS.]

CITY ALLUREMENTS.

THE country supports the city. The wealth of the cities and towns is all necessarily drawn from the farms and the farmers who "pay for all." And not only in the way of legitimate business is rural wealth thus garnered into urban coffers, but by all sorts of fraudulent schemes and swindling devices are the country people made to contribute to the capacious and greedy desires of the city sharpers. The "lambs" from the green fields outside the city are shorn and fleeced by the speculators who offer five per cent. a month certain, and unlimited probabilities of extra profit from stock speculations, in which the certainties are wholly against the greenhorns who venture their money against the speculators' experience. Very soon the money and the experience change hands, and millions of dollars' worth of the latter commodity are yearly gathered in by hapless, rural victims.

This is, however, a virtuous transaction as compared with some of the nefarious schemes devised to entrap unwary country persons. If one should take up a city paper which has a large circulation and proportionate advertising business, its columns will be filled with the most palpably fraudulent announcements. Widows sorrowing over dearly loved husbands offer to sell, day after day for weeks and months, the deceased man's property, sold solely on account of the death. Broken-down horses, irreparably damaged and diseased but guilefully gotten up to deceive, are the favorite subjects of these bogus widows, and farmers seeking horses are the prey prayed for. The household effects of a gentleman departing for Europe, which consist of gaudy and cheap furniture, put together with glue and which will fall apart in a few weeks; worthless daubs represented to be paintings by first-class artists; pianos of similar character with the furniture, and made expressly for these sales, are forced on to unsuspicious rural purchasers, (desirous of making a show and of astonishing the natives by their magnificence) by gangs of confederated swindlers, experienced in all the arts and wiles of the confidence games. Business opportunities of every kind are offered by the hundreds to newcomers from the country who have more money than experience, and all these are put forth in such alluring and seductive guise, as to deceive even some of the city residents, themselves. But the most abominable cheats are those which offer situations to poor men from the country, coupled with the demand of a deposit of a sum of money, merely as a guarantee of honesty in the absence of known references. "The best of security," generally a mortgage on imaginary property in a suburban locality, is offered to secure the deposit. A few dollars are paid as wages, when the unhappy victim is on some early day astonished to find his employer vanished and the place of business deserted. Occasionally one of these rogues is hunted down and punished, but usually the disheartened and perhaps ruined youth, robbed of his last dollar, is only too glad to escape from the city and go back to his home to hide his wound, and to find himself a wiser and a sadder man. A recent case may be instructive to those concerned. A young man came from the country to seek employment in New York. Looking over a leading advertising paper he read the following.

"WANTED—A clerk for a safe and money-making business. Salary $12 a week guaranteed. Jones, 75 Center St."

The young man applying at the place, found an old man (a smooth, plausible villain, however) surrounded by a few barrels of apples. Mr. Jones required a deposit of $300 from the stranger as security "as a matter of form," and secured the money by a bogus mortgage. The money was deposited; the young man entered on his duties, which were the sorting over of the few faded apples, and looking out with vain hope and weary expectation for a customer, who came not. In the meantime he received but $3 on account of wages, while, as it afterwards turned out, his employer under other names and at other places was pursuing the same spider-like hunt for other prey, which as a matter of course he found. After a time the young man was amazed to find the place deserted, the apples had disappeared and Mr. Jones vanished. By good fortune the swindler was caught and other victims appeared against him, all of whom had the same story to tell. The rogue was held for trial, but it is probable he may escape punishment on account of the difficulty of prosecuting such a case with all the delays of law, and through the obvious want of means on the part of the victims. The truth of the matter is that cities are overflowing with misery and wretchedness caused in this and other similar ways. They are swarming with harpies who prey upon inexperience, ignorance and too sanguine hopes. A stranger coming to the city cannot be too careful to keep his money at home and send for it as he may want it, and never NEVER send money to be used in speculations. The more brilliant the promises of these, the more disastrous will be the disappointment.

NOTES AND COMMENTS.

HEREFORD CATTLE are, no doubt, exceedingly healthy and extraordinarily good breeders, and it is very much in their favor that it is not customary with the breeders of them to feed in such a forcing way as is general with Short-horn men.

Mr. Talcott's queries respecting the effects of close, in-and-in breeding are very pertinent. It would be satisfactory at the present moment to know the real cause why the Short-horn breeders in this country have been giving up their herds one after the other for the past 20 years.

"True Percherons" are lauded by "Westerner." There is not the slightest doubt about there being altogether a finer style of draft horse used in the great breweries in London than in any other part of the world. "Barclay and Perkins" employ competent and reliable dealers to supply them with the very best to be found on the earth, and I believe their great number of dray horses would average, in their usual working condition, nearly 2,240 pounds each, and yet they are very handsome and superior animals. There are good horses imported from the Continent into England, and Percherons, Normans, Belgians etc., are sold in London, but it is useless to deny that they are all inferior to the "Cart Horses" bred and raised in the midland counties of England. The Percherons, the Normans, etc., have been improved by the use of stallions purchased at the fairs in England, and within my memory there was a constant annual drain of splendid stallions of this sort half a century ago, cart horses being sought for by breeders of draft horses as eagerly as the sporting men looked out for thoroughbreds.

DUCKS.—I have raised a great many ducks and seen hundreds which have had access to water from the day they left the nest. Whether they should have this or not depends upon the kind of stream and whether there are rats, large frogs or turtles. I lost 70 in one day from turtles one of which was a monster. These ducks were two weeks old. Where there is a nice, quiet, slow-running stream and there are no enemies to the ducklings, I am sure no harm is done to them by their swimming, waddling and wading from morning till night. They will eat grain of any kind, split corn, etc., and come to any place where it is always to be found and they will come home at night when they are a few days old. Hens will raise them well, but will forsake them early, and in warm weather the little ungrateful wretches pay no heed to the poor anxious mother. If the water is changed often, little ducks will do very well as stated by Mr. L. S. Hardin.

CLOSE CONFINEMENT OF SHEEP.—The Winter having set in early and the snow being deep, the sheep will have too much inaction, especially the breeding ewes. Many farmers are keeping a flock for the first time, and if the ewes are injured by close confinement these men will for ever condemn sheep husbandry as a disappointment. To prevent ill effects from idleness I am driving my sheep every day, when not too stormy, to one or other of several pieces of pasture on which there still remain uncaten some bunches of grass, twigs and various sorts of herbage grown after midsummer. It is interesting to see the sheep paw and pick out mouthfuls of grass and take bites of whatever they uncover, and after three or four hours of busy employment they come home looking bright and happy.

G. G.

The Price of the Rural

I have been thinking over what you say about your mistake in putting the price of the RURAL at $2: you had better in my judgment go back to $2 50; it will then be cheaper than any of the monthlies. The reduction in price detracts from its usefulness by forcing you to make advertising pay the loss. But the worst evil is, it forces you to depend too much for reading matter upon voluntary contributors, and to see your able corps of correspondents (the most of whom work for you for nothing (!)) find their own stationery, pay their own postage, and "grub stakes," and the question is, is it in human nature to do good work under those circumstances.

Raise the price after February to $2 50; explain frankly the reasons for it, and see if you be not sustained.

D. S. M.

RURAL BRIEFLETS.

MR. John B. Moore, of Massachusetts, announces conspicuously a "New Cross-bred Asparagus." Would he kindly tell us what is meant in this case by "cross-bred?" According to our observation, the ovule of the asparagus flower is fertilized before it opens, and the male plant is of no service. What varieties were used to obtain the cross? How does he *know* it *is* a cross? We ask these questions in no spirit of incredulity, but merely for information. . . . . .

MR. Moore in a letter to the Editor says:

"Our new white grape "Hayes," which was exhibited before the Massachusetts Horticultural Society in September last and awarded a first-class certificate of merit, is now in course of propagation. This grape is a pure native, fine in bunch and berry, of excellent quality and extremely hardy. This last feature is particularly noticeable, the leaves hanging to the vine long after those of all other varieties have dropped. The "Hayes" can be recommended as a white grape especially suitable for the Northern and Eastern States and Canada. The dissemination of this variety cannot be accomplished for some years to come, and in the meantime all persons interested in grape culture are invited to make a thorough investigation of the merits which are claimed for it. Hoping that you may sanction this attempt to place before the public a white grape, that can be profitably cultivated——". . .

WE wish to ask Mr. Moore how "all persons interested in grape culture" can make "a thorough investigation of the merits" of the "Hayes," if it is not to be "disseminated in some years." . . . . . .

IT is proposed by the Editor of the Toronto Globe that, in order to destroy the pea-weevil, it is only necessary that the bags containing the seed peas be brought into a warm room there to remain until the weevils come out of their holes. Once out they may be left to die. Beans and all leguminous seeds liable to be infested, might be treated in the same way. Prof. Comstock, commenting upon the above, admits that it is a reasonable plan, but asks why not use carbon bisulphide with which the weevils will be destroyed, whether they leave the beans or not? . . . . . .

"REPORTS of large yields are very common every year, but I must say I am in some sense a 'doubting Thomas.' When I see it stated that one hundred and fifty bushels of shelled corn have been gathered from an acre on Long Island, as I noticed some time since in a New York paper, I must be set down as a 'doubting Thomas.' To get a statement of such a crop, men take green ears and estimate with every allowance favoring the big story."

Thus Mr. G. W. Hoffman, of the Elmira Farmers' Club, expressed himself at a late meeting, as reported in the Husbandman. Presuming that the New York paper referred to was the RURAL NEW-YORKER, we would say that had Mr. Hoffman read the reports of the several committees who visited the fields and estimated the yields, there could be no room for doubt, proven as the results were by our own actual measurement. We extended a general invitation to all interested in determining the yields to visit the Rural Farm, so that our own statements might receive support which would place them beyond suspicion. What more could we do? We regret we had not extended a special invitation to the members of the Elmira Farmers' Club. Had they accepted, they could no longer have remained among the "doubting Thomases," while if not, it would have been the more ungenerous in them to have disputed the statements which, it will be admitted, we were at great pains to have trustworthy. . . . . .

What Others Say.

THE BACKSETS IN SUGAR MAKING.—Thus spoke Mr. I. A. Hedges before the third annual meeting of the Cane Growers' Association, held in St. Louis December 21:—"Although sugar making is our great object, there have been more backsets caused by efforts to teach men to learn to make sugar before they had learned to make sirup than from any other one misdirection. I find those of most experience readily admit that after good sirup is made out of well developed cane, sugar making is an easy matter. This conclusion leaves us only to devise the best means of accomplishing the work profitably. I have so freely given my views on this subject, through the organs of our Association, that it is only necessary for me to briefly recapitulate them here, viz.: Small works do well as initiatory beginnings, but for permanent money-making establishments capital is essential, aggregated by association of individual investment, and in all such cases I am convinced that the first season should be devoted to sirup making in order to educate a crew of men and fully test the entire apparatus, as well as to settle the results of the soil surrounding the works. For this purpose careful polariscopic tests of the cane from all the varied soils growing the same should be made. That the use of vacuum boiling pans will be the better method is scarcely disputed, hence the location should be selected with that object in view. These considerations, as well as the ultimate results, will suggest the importance of the consultation of a competent person in the outset, so as to avoid mistakes. The lack of experts is the present great difficulty to the rapid advancement of this industry."

SORGO SIRUP.—Colonel Lamb, who resides about one mile from Skaneateles, has had several years' experience in the manufacture of sirup for home consumption, says Mr. Rose, in the Husbandman. For three years, previous to the past year, he planted the Siberian Cane and realized a good profit. This year he planted the Amber Cane, and from a few feet less than 100 rods of land had 275 gallons of sirup weighing 11 pounds and 14 ounces per gallon. He plants in rows 40 inches apart, and leaves the plants from three to four inches in the rows. He prefers Amber Cane, as it ripens early. He sells the sirup at 50 cents per gallon. There is a yield of 440 gallons per acre, which shows what may be done under favorable circumstances.

A HINT TO FARMERS.—In some sections—and it would be a decided advance in thoughtfulness and kindness in all sections—farmers give each of their boys and girls, too, a strip of ground to raise whatever they choose upon it, and dispose of the product for their own benefit. It is a favor that they all appreciate, says the Germantown Telegraph, and it is a pleasant and serviceable employment for them in their leisure hours. They will vie with each other in their skill at raising their little crops,

and the proceeds, applied to their own use, are frequently of some value, and the whole arrangement, while it instructs them in the cultivation of the soil, early implants in the children the idea of thrift and economy. Sometimes, where a good many animals are raised, a pig, a lamb, a calf, up to even a colt, according to the age of the children, is given to each to rear and to keep or sell. Farmers, think of this; it will more than repay you in the happiness and confidence it will impart to your sons and daughters.

TIRES LOOSENING.—At a late meeting of the Farmers' Club of Elmira (as reported in the Husbandman) the question was asked if the tires of the Davis iron wagon would grow loose. One member replied that this was impossible because they are set upon iron spokes and there is, therefore, none of the swelling that comes to wooden wheels in wet weather, and, of course, there cannot be the corresponding shrinkage.

J. Bridgman said that he had been troubled so much with loose tires that he had resolved to buy one of these iron wagons to obviate the difficulty, but he supposed it would be heavier than a wooden wagon, and that would be an objection.

J. Burnham replied that his wagon with the double box, whiffletrees and everything complete, weighed 1,050 pounds.

J. Bridgman remarked the difference between it and a wooden wagon in weight was not perceptible.

ANOTHER VICTORY FOR AMERICAN MANUFACTURE.—A cablegram from Melbourne, Australia, just received, says:—"At a field trial of grain binders held under the auspices of the Melbourne International Exposition, now in progress, the Walter A. Wood, Twine Binder was awarded the first prize, McCormick, Osborn and others competing."

Everywhere.

RURAL SPECIAL REPORTS.

KANSAS, Cedar Vale, Chautauqua Co., Dec. 29.—Some time last Summer the RURAL NEW-YORKER had a good deal to say about war on insects; but if we wage this war with poisons, it seems to me we are doing just about as much mischief as good. My two younger boys, who make the field and prairie their school and study-room, have taught me that. This has been a very bad chinch-bug year hereabouts, and one of those boys' observations was of a very consoling character. They found out that some other insects preying upon the "chinches," increase pretty fast, too, and "get away" with them at a pretty lively rate. We have also had some potato beetles. After they have deposited their eggs there comes a little bit of a slug that takes hold of the eggs one by one and sucks them in a gourmand like manner. [We observed last season these little things, and how rapidly the eggs were eaten by them. They cannot have escaped the notice of entomologists, and yet we do not remember to have seen any account of them.—EDS.] Now, if we fight the pests with Paris-green or London-purple, we must destroy their enemies with them. I believe Mother Nature will take care of these things best, if we only do not ruthlessly break her established equilibrium. But there lies the rub.

You once said that seedling grapes may bear and may not. I have about 150 of them out, two years old last Spring from the seed (gathered from the native wild grape), and once transplanted. Last Spring they all blossomed, and many of them so profusely that they almost scared me, for I feared they were going to kill themselves. I counted over 150 bunches on some vines. But the extremely dry weather caused them to drop their blossoms, and only a few of the latest bore some fruit. [The RURAL would be glad to hear as to these grapes—their difference in size, color, quality, etc.] We have had quite a supply of peaches here, but only from seedling trees; the budded fruit did not amount to anything. I had an indication of the same difference in toughness in my grape-vines. There are some rows of Concords and Clintons, raised from cuttings, in the same plot. I commenced trimming them in early March, leaving the cut vines on the ground, to be removed later at leisure. Then came that terrible cold snap that killed the budded peaches. When it was fairly over I resumed my trimming, and was astonished to find that the cut-off seedling vines had taken root, even where they had only lain loosely on the ground. The Concords and Clintons showed no signs of doing the like, and they were a year older. So my advice to fruit growers in untried localities would be to rely more on seedlings. Be sure to get something, and take the chance of what it will be and improve it in time.

The RURAL has already recommended the culture of root crops, and it is quite right in that. But if anywhere the seed is of the utmost importance, it is here. For several years—since I have been here—I have cultivated a few rows of beets, and have always been vexed to see them come up and grow so unevenly. This year I carefully set out about a dozen of the finest beets in order to raise my own seed. One Sunday morning, when they were in blossom, I happened to take a walk through the field, to see how the crops were getting along, when it seemed to me the beets made far too many shoots to be able to mature all the seeds well. So I went for a pair of small pruning scissors and shortened the shoots in pretty nearly one-half. Three plants I left untouched, in order to judge of the difference. And a difference there was, and a very marked one. The trimmed beets ripened their seeds evenly in size and of a superior quality at the same time, while there was a great deal more trouble to gather the other seeds, on account of their ripening so unevenly. This difference alone paid for the trouble of the trimming, and then there was the vastly improved quality of the seed besides. Next year I shall not only trim down the shoots, but cut the weakest ones entirely out. The seed I now have looks as if I could trust it if planted like corn. H. S.

N. Y., Corning, Steuben Co., Jan. 1.—The prices of stock are very low. I hear of good cows selling for $12 to $15; and yearlings at $6 to $8 apiece. Hay is high, $16 a ton—and good straw $10. Two years ago $7 a ton were all that was paid for first-quality hay delivered at the press. Beef is three to four cents; potatoes, 30 cts. per bushel; apples, 25 cts.; butter, 26 cts.; eggs, 25 cts. We had an unusual amount of high winds the past Fall, doing considerable damage to buildings and uprooting many trees in surrounding towns. The epizootic has been having a run, but I have heard of only one horse dying from the effects of the disease. Ice is being gathered, and it is of good quality and thickness this year. I am glad to note the improvements that have been made in the RURAL NEW-YORKER during the year just closed, and sincerely hope the agriculturists of the country will appreciate them. It looks strange, but it is nevertheless a fact that the majority of farmers' homes are not so well supplied with agricultural literature as they ought to be. Why is it that we see so many old sheep on our farms? When we consider how much easier young sheep are kept than old ones and the greater profit from them, it is certainly not good economy to keep any over six years of age—at least that is my idea. F. H. D.

WIS., Auburndale, Wood Co., Jan. 2.—I came into the woods here and "took up" a farm about 18 months ago. I never had any experience in farming; did not know how to sow grain, or make a garden; but hit on the happy thought that I ought to have a good, reliable "agricultural paper" to commence with; so I sent for the RURAL. It has paid me ten times over the subscription price, to say nothing of the seed distribution. I have now 17 acres cleared and under hay; I cut two tons per acre last year, and sold it for $12 per ton, realizing $24 per acre for cleared land, annually. I think this is not bad. But I cannot expect to plow for some years yet. My Ovoid Mangels did well, though in York State it would not be considered so; they averaged about seven pounds, say from four to ten pounds; but I sowed them on new land without manure. My Ennobled Oats did excellently. The raspberries and willow look well. The flower seeds did not germinate except the pentstemons and manroot. I have a specimen of both of these. I planted my potatoes last Spring on new land; they did very well, but next Spring I intend to plant on the same land again without plowing (it is impossible to plow) and have hauled on the land some very old barn-yard manure from a lumbering camp; and intend manuring them in the hill. Now, which had I better do, put the manure in first, laying the potatoes on the manure; or lay the manure on the potatoes. J. R.

[*Such* manure is equivalent to a highly enriched soil and should be placed where the roots will feed upon it from the start.—EDS.]

The Querist.

ANSWERS TO CORRESPONDENTS.

An Infertile Cow, Etc.

F. F., Van Wert, Ohio, says, 1, that a year ago he purchased for $50 a pedigreed Short-horn cow, 12 years old, weighing 1,500 pounds, for the purpose of getting a calf from her by a pure-bred Short-horn bull. She has been with the bull three times, but she is not with calf, and he asks what shall be do with her. It seems a pity to make beef of her, as she is very finely formed, gentle, a good feeder, and has had calves. 2, He has a half-bred Jersey heifer calf from a Jersey bull and a 15 year-old common or "native" cow which has been a remarkable milker. Heretofore her calves have not been extra-good milkers, though they have always been of her color, and he asks whether the half-Jersey is likely to be a better milker than her elder sisters.

ANS.—1. The cow is not too old to breed well, for Short-horns have often done so till past the age of 20 years. It is just possible she has formerly been fed too highly to make her show finely, and this may have injured her procreative power. The best way we have found to get a cow, and indeed all other domestic females, with young, under these circumstances, is to breed to an extra-vigorous male, if to be had, and let him cover the female as many times as she would stand for him. If this does not succeed, then the cow should be reduced in flesh by feeding hay, cornstalks or straw, without any grain, but a few vegetables may be added daily if necessary. During this time she must have plenty of out-door exercise in the day, and be kept in the sun as much as possible. After getting pretty thin in flesh, then put her again to the bull as directed above. It would have been much better for our correspondent to have added another $50 to the above amount and purchased a two-year-old Short-horn heifer, as a reasonably good one without pedigree—and perhaps with it—can be occasionally got for $100. 2. If the bull that begets the calves comes from a good milking strain—for there is a great difference in Jerseys as to this—the calves generally make rich and deep milkers, provided the dam is a good milker. It is quite extraordinary that this cow has not produced superior dairy animals.

Hen Manure and Stable Manure, Etc.

J. E. D. B., Waverly, N. Y., asks, 1. the comparative value of hen manure and ordinary stable manure; 2, whether castor pomace is a valuable fertilizer.

ANS.—1. The comparative value of the two manures may be seen by the following table

	Contents of 1,000 pounds of—Stable manure.	Hen manure.
Water	750 lbs.	560 lbs.
Nitrogen	5 "	16¼ "
Potash	6½ "	8½ "
Soda	2 "	1 "
Lime	7 "	24 "
Magnesia	1¾ "	7¾ "
Phosphoric acid	2⅜ "	15½ "

Nitrogen may be valued at 25 cents per pound, potash at 6 cents, and phosphoric acid at 10 cents; the rest is not worth considering. Fresh hen manure is therefore worth only about three times as much as stable manure, so far as its actual value is concerned. The value depends very much upon the condition of dryness. As the water is evaporated and decreased to about 25 per cent., of course, the proportion of the other constituents is increased, but at the best the hen manure is not worth more than about six times as much as good stable manure. Its apparent value depends very much upon its greater solubility and activity. 2. Castor pomace is a valuable fertilizer, being rich in nitrogen and containing about five per cent. of ammonia, besides considerable potash and phosphoric acid. It is, however, only to be procured, at a reasonable price, at St. Louis, where it is made, its bulk and the high freight increasing its cost too much for its profitable use in the East. It is sold at $8 a ton at St. Louis, and at $12 a ton would be a useful and moderately cheap fertilizer.

Black-leg.

A. S. W., Battle River, Dakota, asks what ailed a calf that had just died. When first noticed it was very stiff in the hind-quarters and scarcely able to walk; it died the next morning. On being skinned the right hind-quarter was found to be badly bloodshot and twice its natural size, and around the bone the flesh was very black.

ANS.—The disease was carbuncular erysipelas commonly known as black-leg, black-quarter and bloody murrain. It is a blood disease produced by too copious feeding and consequent unwholesome assimilation of the food. It is confined to young cattle in good thrifty condition and is so sudden and virulent in its attack that remedies are unavailing. When its approach is suspected the danger may be averted by a full dose of Epsom salts—four ounces for a yearling and six ounces for a two-year-old. As other cattle, or even man, may become infected from contact with the disease germs in the bodies of animals that have died from this malady, the carcasses should be buried deeply, or, better still, burned, hides and all.

The Best Floor for a Horse Stable.

H. T., Sioux City, Ia., asks which would make the best floor for a horse stable—earth, brick, plank or cement.

ANS.—Earth becomes soon saturated with the manure and both disagreeable and unhealthful. Brick is too soft; plank is not durable and is often slippery; cement is dry, durable, clean and warm. It should be made of one part of hydraulic cement and two parts of sand, mixed dry and then with water to a thin mortar into which five parts of coarse coal ashes or coarse gravel, previously wetted, is mixed thoroughly. This is laid three inches thick and well-rammed and beaten. When dry and smooth it should be soaked with hot gas tar and dry cement scattered on it until the tar is soaked up. This floor is perfectly water-, damp- and vermin-proof.

Miscellaneous.

H. B. Union Co., Ia., asks whether there is a red raspberry of any value which does not spread from the root; if so what is the variety? where can he get it, and what will be the probable cost per dozen?

ANS.—Strictly speaking there is no red raspberry in cultivation that does not sucker from the roots. Ganargua, Norwood, New Rochelle and the old Purple Cane are sorts that do not sucker and are called red, but all are either varieties or hybrids with part blood of the Purple Cane species, the berries of which are *purple* and not *red*. None of these are desirable except in certain sections. Philadelphia, Herstine and Franconia, or Naomi, are varieties that sucker but sparingly, the two last being among our finest raspberries, especially the Herstine. Plants of all may be had of those who advertise plants of the Small Fruits in the RURAL.

C. N. G., Plainfield, N. J., asks which is the better corn-planter—the Hoosier or the Cornell, of Albany; which would work the best in strong ground and be the most durable.

ANS.—We cannot answer the question, having *used* only the Hoosier upon sandy or gravelly land. We should think either would endure a heavy strain. The Cornell planter is the more elaborate machine. It is provided with hoes and fertilizer attachment. It will drop all the way from two inches to four feet apart. It would be better for our friend to examine both before purchasing.

A. S., Butterfly, N. Y., has some twelve-year-old currant bushes which she wishes to transplant, and asks, 1, when should this be done—in Spring or Fall; 2, if in the Fall at what time; 3, if in the Spring, how early or late can it be successfully done; 4, the nearest breeder from whom full blood Brahma fowls, well recommended, can be bought.

ANS.—1, There is little choice between Fall and Spring. Convenience would guide us. 2, As soon as the leaves begin to fall. 3, As soon as the ground is rid of frost. 4, Geo. S. Josselyn, Fredonia, N. Y.

I. H., West Granby, Conn., asks where can he get the Report of the United States Fish Commissioners for 1879, and at what price.

ANS.—The Report for '79 is not published yet. That for '78 was issued a few months ago. It is published by the Government at Washington for free distribution, and, like other Government publications, can be obtained, if at all, through the Congressman for the applicant's district or the Senator for his State. Members of Congress are assigned a certain number of such publications for distribution among their constituents, and application should therefore be made to them.

F. H., Beloit, Wis., asks where "Spurry seed" can be bought, and at what price.

ANS.—Spurry seed is rarely kept for sale in this country. It is common in England and Europe. It can be procured of R. H. Allen & Co., or Thorburn & Co., of New York, if anywhere: or either of these seedsmen may possibly be able to procure it for you. It should not cost more than 50 cents a quart. It is hardly a desirable fodder plant when we have so many other better ones.

T. H. B., Windsor, Ohio. asks, 1, what is the value of road dust as a fertilizer; 2, is bone that has been softened by remaining in wood ashes as valuable a fertilizer as ground bone.

ANS.—1. This question can hardly be answered. The value of road dust depends upon the value of the natural soil of the road and the amount of travel over it. 2. Yes.

A. S. T., Wyoming, Ia., asks where can he buy "Farming for Profit," and what is its price.

ANS.—This excellent work is published by J. C. McCurdy & Co., Philadelphia, Pa., price $3. The publishers have offices also at Cincinnati, Chicago and St. Louis, where the work can be had.

A Subscriber, Centreville, N. Y., asks where can he get eggs of the Golden-Spangled fowls true to name.

ANS.—Write to B. L. Wood, Doe Run, Chester Co., Pa.

THE
Rural New-Yorker,
PUBLISHED EVERY SATURDAY.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, NEW YORK.

SATURDAY, JAN. 15, 1881.

WE CONTINUE to receive fine reports as to Silver Chaff, of which, as our readers have been told, our main crop consists, in place of Clawson, which we had raised for years before.

Prof. Tracy (Mo.) now writes us that a Mr. Heare (?) of Lexington, Ky., has raised of this variety, on first-class land, for four years, respectively, 45—40—46½ and 30 bushels per acre.

EARLY ENGLISH LAMBS.—We notice that lambs of the Devon horned breed are now taking the precedence of the Dorset horned. Ewes of the former are easily made to breed at any season of the year the owner likes, and two crops of lambs have frequently been obtained from them in a twelvemonth. But this is considered as working the sheep's constitution rather too hard, and might injure the ewes by continuing it. Weak offspring would probably soon follow, difficult to raise, and consequently unprofitable; nor would their meat be so savory and delicate as that from more vigorous and better feeding lambs.

SOUTH-DOWN SHEEP. — These, with their various crosses, are becoming more and more popular for mutton in England, and they are gradually displacing the larger long-wooled varieties; as the mutton of the latter is altogether too gross and fat for good eating. If one wishes to produce the largest quantity of mutton *tallow*, the long-wools are the breeds for him; but if he wishes to get a superior quality of profitable flesh, then he should take the South-Downs. Under this name we wish to include all the cognate breeds, for they are essentially the same; such as in England are called from the counties in which they happen to be bred—Hampshire, Wiltshire, Oxfordshire, Shropshire, etc. We do not like this multiplying of names where breeds of animals are essentially the same, as strangers are deceived by it, and induced to purchase several of nearly the same sort, when one alone would be sufficient.

WE ARE VERY MUCH OBLIGED to friends who send us early reports of the proceedings of agricultural, horticultural or pomological societies or conventions, from whatever section they may come. But many of the reports so received are made up of bald statements that Pres't Smith made an address which was listened to with marked attention; Sec. Brown read an essay on "New Peaches;" Prof. Green delivered an excellent address on "Raising our own Sugar." An animated discussion then followed on "How to Keep the Boys on the Farm." Thanks were tendered to Pres't Smith and Sec. Brown for the valuable suggestions given in their remarks. The society then proceeded to the election of officers, the names, of course, being given in full. We do not see of what interest such reports can be to the general reader, or to anybody besides those who are pleased to see their names in print. What was said, is the important thing.

A LARGE SALE of thoroughbred brood mares came off in England on December 10, and it is astonishing what high prices they brought, considering the great agricultural losses of that country from bad weather for several years past. The forty-eight mares sold, realized 10,865 guineas ($55,868); averaging $1,141 each. One of these mares was Bas Blue, 23 years old, the dam of the famous stallion Blue Gown, recently purchased for $20,000 by Mr. James Keene, the great speculator, who is also a breeder of thoroughbred horses; the animal died, however, from injuries received on board ship, on the voyage to New York. We are informed that this horse was fully insured. Not dispirited by the loss, this gentleman, it is said, has offered $50,000 for another famous horse in England, which was refused by its owner. We hope if he ever ships again to cross the Atlantic Ocean, it will be in Summer weather, when bad storms do not prevail, and full-grown animals can make the voyage with reasonable comfort and safety.

YOUNG ANIMALS AT FAT CATTLE SHOWS.—We observe that at the fat cattle shows lately held in England the number of young animals on exhibition was considerably larger than usual. It would seem as if the exhibitors there had adopted the reform in this matter, begun on this side of water at the Chicago Fat Cattle Show. When animals have become fully ripe for slaughter, it is a great waste of feed to keep them on for months, and even years after this, as has too often been the practice heretofore. If of a good breed, bullocks, sheep, and swine can be now pushed to maturity in half the time that was formerly needed. But in doing this, due care should be taken to give the animals plenty of exercise in the open air; otherwise their meat will not be marbled, but abound too much in fat, and this in coarse, thick streaks, or lumpy; nor will the meat be so savory and nourishing. Because they have plenty of exercise in pure, fresh air, in their wild state, is the chief reason why the flavor of well fed game is so superior to that of our domestic beasts and birds.

CANDAHAR MUTTON.—As this is raised in the Afghan deserts, or in some of the more distant mountainous districts, it is said to acquire something of the flavor for which the mutton grown on the Welsh hills is renowned. The price of this is never quoted in the English markets, as the sheep are not usually taken there for sale. The number which can be reared on the Welsh mountains is small; and rich gentlemen and noblemen are always glad to take them direct from their breeders at high prices, as their mutton is considered a great delicacy on their tables. The peculiar flavor of this is acquired from the sheep feeding on the aromatic grasses, found growing naturally only on the lofty hills of Wales. In the same way it is from feeding on the bulbous roots of a certain kind of grass growing in the Chesapeake Bay, that our Canvass-back ducks acquire their peculiar, high, luscious flavor. If killed before they get to this bay and have fed there a week or two, their flesh is no better than that of other ducks. The Redhead also often feeds on the same roots, and when it does, it is found scarcely inferior to the Canvass-back.

VARIATION IN COW'S MILK.—In recent analyses of milk by Dr. Playfair, of England, he ascertained by varying the food of the same cow, that the milk varied greatly in quality. In one case he found only 3.9 per cent. of butter in the milk, while in another there was as much as 6.7. Again, 2.7 per cent. of caseine was present in one morning's milk, and double this amount in another morning's. Here are data for the dairymen to work upon, showing how much they may increase the value of their milk by attending to the proper feed of their cows, and this they can only ascertain by a series of careful experiments. When engaged in making butter the feed should be such as will produce the greatest amount of fat in the milk; when making cheese that which produces the largest quantity of caseine. In this way double the number of pounds of butter and cheese may be obtained from the same quantity of milk, and probably at little, if any, more cost of feed, thus doubling the annual profit of every cow in the herd. We think there is still much to learn as to the best manner of keeping cows for the dairy. It is more difficult to get at than the best and most profitable method of making beef; but this should only stir us up to be more frequent and painstaking in carrying out our experiments.

WHO WILL FOLLOW THE GOOD EXAMPLE?—During the past week the Legislature of Ohio has set a good example to the Legislatures of her sister States by promptly passing a bill prohibiting the selling of pools upon the result of any trial or contest of skill or power of endurance of man or beast. The bill passed the senate at the last session and was brought up in the house on the 6th inst. when it was passed by a vote of 80 to 16, after which it received the Senate's approval.

The bill makes it a misdemeanor for the owner of a building to rent or use any part of it for the sale of pools, the penalty being not less than $5 or over $500 for each offence, or imprisonment of not less than five days or over six months. The seller or proprietor of any pooling business or association is liable to the same penalty. We can scarcely believe that this will put an end to the pernicious practice of betting on "hoss trots" at agricultural fairs in that State, a practice which we have always strongly reprobated everywhere; but it will at least put a check upon it; and it gives hope of more stringent laws in future. Mr. Sullivan was the introducer of the bill; who will be the introducers of similar measures in the Legislatures of other States? Even if such bills do not pass, their introducers will have deserved well of the farming community by calling public attention to the evil and forcing its supporters upon the record.

PROVE THE CHARGE OR BE SILENT.

A FEW weeks ago a Western Monthly which deals chiefly with stock matters, insinuated a charge against General Le Duc to the effect that he had requested a gentleman sent to Europe on official business, by the Department of Agriculture, to buy some sheep on the General's private account. More recently one of our Western weekly agricultural contemporaries, referring to the charge, emphasized it, but magnanimously offered to insert in its columns any answer the Commissioner might feel disposed or able to make. For General Le Duc to return any answer to a vague charge of this sort, unsupported by any name or proof, would, in our opinion, belittle the important office he holds. What would any sensible man think of the head of any other Department of the Government, or indeed of any prominent official, who might deem it necessary to answer in the public press every accusation made against him, however unsupported by the weight of proof or authority? A Congressional Committee, specially appointed for the purpose, is now investigating the Department of Agriculture and its management, and we submit that all charges of this sort, that are not the results of of personal ill-will or official disappointment, should be placed before it for investigation. There are upon the committee gentlemen enough who have no special friendship for the Commissioner, to insure that all charges to his detriment shall be thoroughly investigated.

AMERICAN ENTERPRISE—A PROSPECT.

IT is only a few years since, with doubt and fear, the construction of the Pacific railroads which should connect the Atlantic and Pacific, was proposed. Some far-seeing and enthusiastic persons met every doubt with confidence and the enterprise was pushed to completion. Even then some people asked each other, What will be the end of this folly? How shall this venture pay for itself? But now what wonderful results have sprung from that experiment. Where we were led to believe lay a vast desert as barren as the African Sahara, we now find green pastures and vast fields whose products have averted famine in Europe and have greatly helped, if they have not altogether done it, to turn the course of the foreign trade in our favor and bring in a huge flood of foreign gold. Few persons adequately consider the wonderful results of the completion of the Pacific Railroad upon American interests. In fact, one can scarcely realize them upon reasonable consideration, so enormous have they been.

But all this is a mere beginning. While we are busily engaged in securing the abundant harvests of that enterprise, other gigantic schemes of peaceful conquest are quietly reaching out arms to grasp the larger part of the North American continent and open up yet another field for enterprise. Just now a Southern Pacific Railroad, passing through Texas, New Mexico and Arizona, lacks but 36 miles of forming a connection between its two halves, each growing and lengthening day by day, and hour by hour, from its respective terminus. While this Southern road is now completing its connection, the Northern Pacific at our other boundary, lacks but 800 miles of effecting a junction, and a syndicate of capitalists in a day raised the forty millions of dollars required to complete it, thus making its finishing a work of but a few months. In addition to these works, the mouth of the Mississippi River has been opened for the passage of the largest ships which may ere long take on cargoes of grain at the levees of St. Louis or the elevators of Chicago by the construction of proposed facilities in the shape of river improvements and a canal.

Every one of these enterprises is for the general benefit. By cheapening communication and transportation the farmers' expenses are lessened and his profits increased; the prices of food and other commodities are decreased and the workman's wages proportionately enlarged; new fields of labor are opened and the industrious man meets a greater demand for his services. With cheaper food and more demand for labor we have the very fundamental elements for unlimited prosperity. And knowing the result of what has been already done, it seems hardly possible to set bounds to what may yet be in store for our country. Surely no other land and no other people can overlook so vast and so valuable a heritage as we can.

BREVITIES.

THE success of cinchona culture in British India will no doubt have the effect, in a year or so, of reducing the cost of quinine.

WE shall soon present a portrait of the Niagara Grape vine in fruit, showing the remarkable fruitfulness of that remarkable grape.

MR. REED thinks that if the farmer of England would live and dress as poorly and work as hard as the American farmer does, he might do as well here as he could in America.

WE are aiming to give the Hardy Shrub and Tree Number early next month. It is by no means designed to speak of all hardy shrubs and trees—that would fill a book—but only of such as are best adapted to the generality of country homes.

INFLAMED EYES IN HORSES.—We find the following simple cure for this malady, and as the medicine gives no pain—like pulverized alum and some other substances—and can do no harm, we recommend its trial. Take an egg and break the large end enough to admit the handle of a teaspoon; pour out the albumen or white; mix in all the salt you can until it is quite stiff; then set it in the center of a heap of red coals, and let it burn till done baking. When cool grind or pulverize this fine in a mortar, and blow a pinch of it into the eyes once a day.

A MEETING of the American Agricultural Association was held lately in this city. What is the A. A. A? What! have people already forgotten the hubbub made about its organization scarcely one short year ago? In spite of the efforts of Mr. Reall, the Secretary, it has not hitherto made much advance, but the following officers who have been elected for the current year, may push it along more successfully. President, Col. N. T. Sprague of Vermont; Senior Vice President, Dr. John A Warder of Ohio; Secretary J. H. Reall, 127 Water Street, New York; Treasurer, Henry M. McLaren, New York.

A SPECIMEN of the swindles referred to in the article "City Allurements" published elsewhere in this issue has just come to light in this city by the arrest of James H. Langley Treasurer of the Mexican Guano and Fertilizer Company, who swindled Henry Cooke out of $400 which were required as a deposit preliminary to his obtaining a situation in connection with the company's alleged guano islands. Cooke worked two months, for which he got not a cent; nor could he recover his $400 when he became convinced that the company was a fraud. Strangers in cities, from rural districts, cannot be too careful in avoiding such "city allurements."

THIRTY years ago the center of the flour milling interest of the country was in the northern parts of this State, especially in Rochester and Oswego. Since then, however, the railroad system has been constantly extending westward, while the "wheat belt" has been steadily shifting in the same direction, so that the milling business has been largely transferred to the West and Northwest, where about two-thirds of the flour manufactured in the Union is now produced. During the last decade the Northwestern States have doubled the number of their flour mills and tripled their run of stones, and new milling facilities of the latest and most approved patterns are constantly either taking the place of the old ones or adding to their productive capacity.

IMPORTS of Australian wheat into Great Britain are growing considerably more rapidly than even our own, and the grain from that quarter is of very superior quality. In October and September 1879, the imports were 428,360 cwt.; whereas, during the same period this year they ran up to 1,300 000 bushels—more than three times the quantity imported from that direction last season. Oats and barley are also imported from there, the latter selling at good figures for malting purposes, and the former being of fine appearance, but a trifle too thick-skinned. If Australia can afford to pay the heavy freight on the transportation of these products to Europe, surely we might find a profitable market there for more of our own crops, in view of the lower freight charges from this country.

HERE and there are found some people who, in spite of the disasters caused by the "Morus multicaulis" craze of about a quarter of a century ago, still believe silk culture can be profitably followed in the United States. We are not of this number. It is generally conceded that the climate of California is more favorable to success in this industry than that of any other section. In no other part of the country have so many careful and expensive experiments in the matter been made down to the present day, and hitherto, without one exception, these have turned out more or less unfortunate. Upwards of twenty-five years ago Mr. Provost, of San Jose, devoted years of his life and his whole fortune to the enterprise and died after finding it a failure. Since then Newman Brothers, A. P. Smith, of Sacramento, W. Blanding and Charles W. Reed, of Davisville, have spent money, labor, time and earnest efforts in trying to make silk culture profitable there, but not one of them has succeeded in his endeavors. The few who still cling to the idea that under present conditions this industry can be made remunerative in any part of the United States, would do well, it seems to us, to abandon the notion.

For Women.

CONDUCTED BY MISS RAY CLARK.

HOW CAN A WOMAN TELL?

MRS. M, A. KIDDER.

He told me his love this morning,
With his dear hand clasping mine,
And he said, "God speed the dawning
When, sweet, I shall call thee mine."
But my fond heart questioned softly,
Though loving him true and well,
Will his love outlast all changes?
Ah! how can a woman tell?

When the years shall bring their trials,
And the cares and the pains outweigh
The joys in the little household,
As clouds might obscure the day,
Will the hand that has held mine fondly,
When maidenly ills befell,
As earnestly shield from sorrow?
Ah! how can a woman tell?

When the silvery threads are creeping
Through my tresses one by one;
When I lose my youth and beauty,
As many a wife has done;
Will his heart be mine as truly
As when in the flowery dell
He gave me his trusted promise!
Ah! how can a woman tell?

I glance at my sweetheart waiting,
His eyes they are clear and true;
"I will love him," my heart says gladly,
"I will trust him the wide world through,"
I will be to him joy and comfort,
I will all other wives excel,
I will keep him with love's sweet magic—
This much may a woman tell!

DESCRIPTION OF CUTS.

FIG. 25. HAT.—The hat is of dark green beaver, trimmed with ostrich feathers of the same color.

FIG. 26.—WALKING OR HOUSE DRESS, in Indian Cashmere and Plaid Material.

FIG. 27.—BRUSH-POCKET.

The pocket is of undressed holland. For the foundation of the back, cut a piece of cardboard sixteen inches deep and nine inches wide; cover with holland, and bind with blue ribbon. The pockets measure seven inches deep and five inches wide. These have a piece of holland two inches wide bound to the front all round with blue ribbon to form the sides by which they are attached to the foundation. The front of the pockets are ornamented with cross-stitch designs, worked with blue

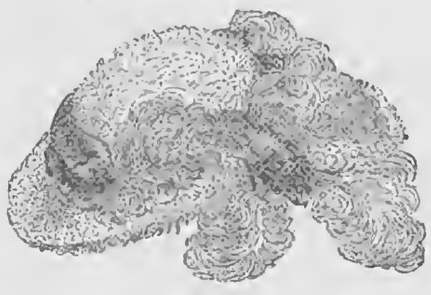

FIG. 25.

marking filoselle, as are the initial letters on the top of pocket. Three loops of cord with tassels are fixed to the top.

TABLE-SPREAD.

MRS. J. E. S.

This comparatively inexpensive table-spread represented in Fig. 28 is made of cretonne cloth, narrow black velvet ribbon and coarse spool silk. In the place of the velvet and silk, worsted dress braid and embroidery worsted may be used.

Take figured cretonne for the center blocks and striped cretonne for the border. Those marked *a* and *b* are squares of figured cretonne forming the center of the spread and may be nine inches or more, according to the size of spread wanted. The pieces should be of two kinds, or rather colors; that is those marked *a* dark and, those marked *b* bright, or vice versa. These blocks are sewn together so that the seams are on the right side of the cloth. The seams are pressed and covered with velvet ribbon just the width of the seams. This ribbon is feather-stitched on, generally with old gold-colored silk. The border is made of the striped cretonne—the width being double that of the center stripes—sewn on and covered in the same way. The heavy lines in the figure are sewn together with the seams on the right side and covered with the velvet ribbon feather-stitched on. The dotted lines at the four corners are simply sewn together with the seams on the wrong side of the cloth and neatly pressed. Some of the cretonne is cut lengthwise into stripes three or four inches wide and then these stripes were cut crosswise about a quarter of an inch in width leaving enough of the width of the stripe uncut, to sew on; this forms the fringe. If cut into stripes too narrow the fringe is apt to fray. If a heavier fringe is wanted than can be made from a single fold of cloth, it can be sewed on double.

Persons not having seen this kind of table-spread will be surprised at the richness and beauty of it. With few exceptions it would be suitable for any parlor throughout the country and would only fail to harmonize with extreme richness.

A FRIENDLY LETTER.

DEAR RURAL:

It is natural at the holiday season to think of distant friends and as I have long wanted to have a chat with you to thank you for your many letters of earnest counsel, good cheer and kindly greeting, I take this opportunity to do so.

When the mail is brought in, the RURAL is tossed over to me with the words, "There is your paper."

We have no farm—only a village lot of fruit trees and flowers, but still—"The RURAL" is just what we like, the paper of all others of our choice. You ask us to tell what pleases us most in it; now is not this asking too much? Just think of ones sitting down deliberately to designate the particular charms of a loved one; to analyze the why and wherefore that attracts! Have *you* the leisure requisite for a perusal of the long list? Would not even you call out "Condense, condense." "Time is money?" or, you did not ask us to criticise; were you not a little sly there?

You say "The portraits of distinguished farmers and horticulturists will be continued in 1881." How delighted the "Rural family" will be to have the father home at the holidays at the head of the feast he gives us, his face greeting us with "A Happy New Year!" You surely knew how much we wanted to see the old homestead when you sent that view of "The Rural Grounds." Many thanks for the pleasure it gave us to take a peep at your surroundings; that reminds me of another criticism; is it not too bad to profess love and then find fault? but some country ladies in speaking of architecture said most of the plans in the papers had too much waste room in halls, vestibules, etc.—for plain, country people; also requiring means of heating not easily attained in the country. Now, to come to the confessional, I am glad I am not looking in your face, when I acknowledge I have two hobbies! one is a love for flowers; not merely a love for them, but companionship with them individually; each one speaks a different language, and as a little girl said, "Heaven would not be so bright without the dear little flowers we have learned to love on earth." My other hobby is planning houses: now don't laugh and say, "strong minded." Not at all, it is only for arranging the interior so as to be most convenient for the family; this surely, is woman's work! These home arrangements must of couse be varied to suit the varied wants of different persons.

The city family with its princely hospitalities and retinue of servants, requires a very different establishment from the keeper of a small farm in the country, whose help consists of his own household. Well, this will never do! I spare you an essay on architecture, and again thank you for your good work for our country.

May many a "Merry Christmas and Happy New Year" be yours, who have contributed so much, to make happy the hearts and homes of your large family! Your's truly, MYRTLE.

[Although marked *private* we have taken the liberty to insert the above in acknowledgement of the kindness.—EDS.]

LUCRETIA MOTT.

BERTHA A. WINKLER.

ANOTHER bright light of the New World, has passed away—has raised the last veil of mystery and joined somewhere, somehow, the great kindred spirits gone before who, like her, have rendered faithful service to their country, and all future generations in the cause of truth, progress, and humanity.

What a noble assembly there must be in that vast area circled only with eternal infinitude! With bated breath we contemplate some sublime, Miltonic conception floating past the mind's eye and only the tremulous lips, the sudden tear faintly reflect some of that possible reality—the laborers of love; the teachers of compassion; the searchers after truth; with the smile of triumphant joy upon ethereal lips; the lustrous glory of noble deeds encircling ethereal brows; and she, the new arrival knowing, feeling, seeing all, at last. 'Twas worth a death to see such a life! 'Twas worth a farewell to receive such a welcome!

Few women but that know something of this brave, noble spirit enveloped in Quaker—sobriety and burning with an enthusiastic ardor; few who have not traced some mighty strides of human progress to her originating ideas and vigorous prosecution of them; and fewer still who have

FIG. 26.

not directly or indirectly been benefited by the workings of that tireless brain, and the warm pulsation of that mighty heart for an enslaved race and a degraded womanhood.

We remember the mob-violence: her brave eloquence against slavery excited some forty years ago, with wonder; we remember the general ridicule, in which she maintained her own and ours against the social slavery of her sister-women a few years later, with heartfelt gratitude: and we contemplate her whole eventful, toilsome, fruitful life with glowing ardor, feel eager to enter the path with hands ready to take up the great task yet unfinished.

The first of the great works which engaged her sympathies was born of compassion, fostered by the love of liberty and accomplished by the sword she abhorred. The second, sprung from the anger of unheeded justice; grew up in the mail of incon-

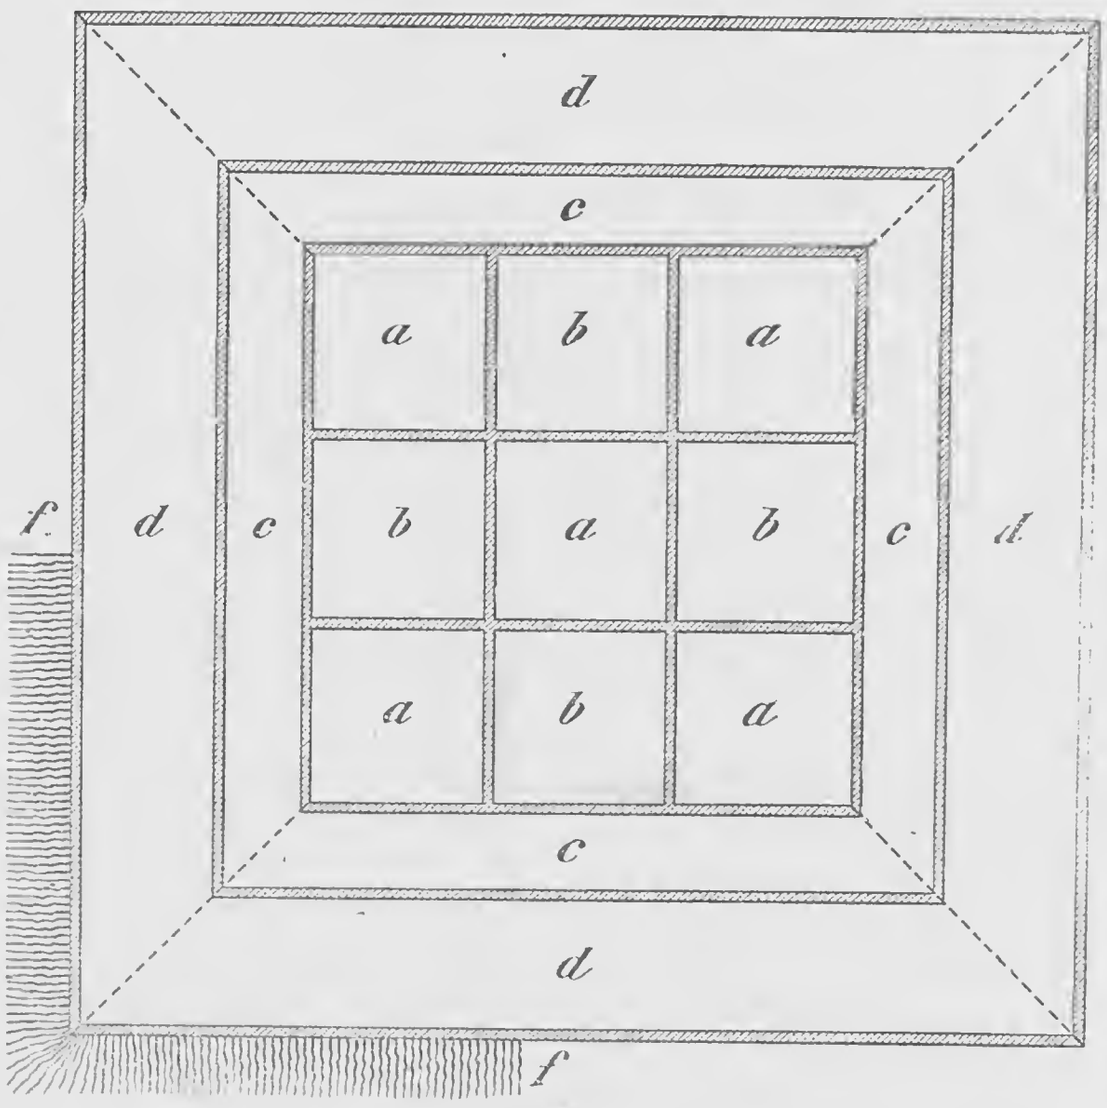

FIGURE 28.

testable truth too strong for battle, it shall be triumphantly accomplished in the peace she loved.

What, though she never lived to reap the full harvest? Did she not sow the seed and behold it bursting forth in fertile brains with the vigor of a truth-born power? Did she not diligently till the soil and behold it spreading over the whole garden of America, even beyond its boundaries into the old world's conservatism?

Here she has seen it in its promising bloom; yonder in company with her blessed co-laborers, she shall receive it in its ripened glory.

Farewell, daughter of pioneers! thyself a pioneer in woman's first land of liberty. Farewell revered mother of our noble cause! link of two generations with but one heart, and one hope the fields of thy labors are whitening, and an army of young daughters are here to harvest it in grateful remembrance of thee.

WIVES CONSIDERED.

As I AM neither an *old* maid nor a married woman, perhaps I can talk for a little while, without being *very* severely criticised.

Alline Ray says, "The farmers' wives have hard lives, doing all kinds of work, without assistance from their husbands."

It is true, there is more, and harder work to do on a farm, than elsewhere, but if you will observe closely, you will see that it is the *man* and not the *farmer*, who is indifferent to his wife's wants. A selfish man, whether farmer, or merchant, will think of his own aches and pains, regardless of his wife's comfort.

I am a farmer's daughter yet I never think of churning; and I can asssure you, I am far from being lazy.

It is women's own fault, that they receive so little help from the men. Men in general are rather thoughtless, but I feel sure that every man would be willing to help his wife or sister, if asked to do so. As far as *my* experience goes, farmers' wives are more happy and contented than any others. As to old maids, I do not think they are half so *snarly* as many married women. MARY E. S.

LADIES' TEETH.

BAD as Australian ladies' teeth are, and busy as dentists find themselves here, the American ladies are even worse off. An exchange says:—"Americans have, unquestionably, more perishable teeth than the English; probably than the French or the Spanish. But whether they have worse teeth than the mass of Italians, Germans, Russians, or other races is by no means certain. The common people, even many of those in tolerable circumstances, in other lands, neglect their teeth, rarely going or thinking of going to a dentist. But here, as a rule, almost everybody depends on art to make up for the ravages of nature. This is clearly shown by the fact that not less than 12,000 dentists, or one to every

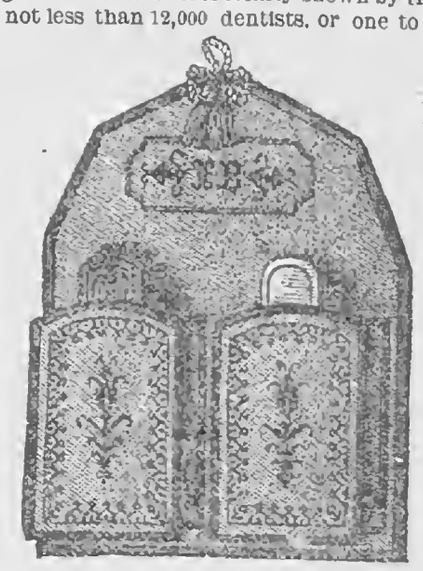

FIG. 27.

4,000 inhabitants, find employment in the United States. A prominent dentist has lately published an article in which he declares that about half a ton of pure gold—representing some $500,000—is annually used for filling teeth in the Republic, and that nearly four times as much material of a cheaper sort, silver and the like, is used for the same purpose. He estimates that only three centuries would be needed to put all the gold coin now in circulation in the country—$150,000,000—into graveyards by filling the teeth of different generations. He also says that almost 3,000,000 artificial teeth are made or mounted on various kinds of plates every year, and that out of an average of 80 persons of all classes here—the estimate is based on carefully-prepared statistics—only one person has perfectly sound teeth. The statement is not pleasant; but, conceding its truth, if we do not like it we can hardly resent it by showing our (own) teeth. In Sydney and suburbs I believe that the real cause of bad teeth is the absence of lime in the water we are supplied with. A leading Sydney dentist, however, attributes the great decay to fruit eating, and in support tells me that the most of his customers are from Hunter's Hill and Parramatta River generally, and that at the beginning of the orange season.—Sydney Journal.

HOW GIRLS ARE MADE STRAIGHT.

THE Hindoo girls are graceful and exquisitely formed. From their earliest childhood they are accustomed to carry burdens on their heads. The water for family use is always brought by the girls in earthern jars, carefully poised in this way. The exercise is said to strengthen the muscles of the back, while the chest is thrown forward. No crooked backs are seen in Hindoostan. Dr. Spray says that the exercise of carrying small vessels of water on the head might be advantageously introduced into our boarding schools and private families, and that it might entirely supersede the present machinery of dumb-bells, black-boards, skipping-rope, etc. The young ladies ought to be taught to carry the jars as these Hindoo women do, without ever touching them with their hands. —New York Express.

Miss Olivia Phelps Stokes, daughter of Mr. James Stokes, has presented to the City of New York a beautifully wrought drinking fountain, which is now in course of erection at the intersection of Madison avenue and Twenty-third street. Its cost will exceed six thousand dollars.

Literary Miscellany.

THE OUTCAST.

JOSTLE him out from the warmth and light—
  Only a vagrant, feeble and gray,
Let him reel on through the stormy night—
  What though his home be far away?
With a muttered curse on wind and rain,
He crept along through the muddy lane.

Lonely the pathway, and dark and cold;
  Shelter he sought 'neath a ruined wall;
Over his senses a numbness stole,
  Round him Sleep threw her mystic pall;
Then an angel came, with pitying tears,
And lifted the veil of by-gone years.

Gaily he sports by a rippling brook;
  Soft is the breath of the Summer air;
Flowers adorn each mossy nook,
  Sunshine and happiness everywhere.
He is *Willie* now, just four years old,
With his rose-bud lips and curls of gold.

Hark to the roll of the war-like drum!
  See the brave soldiers go marching by!
Home from the battle young *Will* has come,
  Courage and joy in his sparkling eye.
And his pulses thrill with hope and pride,
For he soon will greet his promised bride.

Now in the fireside's flickering glow,
  Calmly he's taking his evening rest;
Fondly he kisses his infant's brow,
  Sleeping secure on its mother's breast.
(And the dreamer stirred, and faintly smiled):
He is *William* now, with his wife and child.

* * * * * * *

The curtain dropped—the morning broke—
  Faint was the flush in the eastern sky;
Moaning and wretched the sleeper woke.
  Brushing a tear from his bloodshot eye.
To his squalid home behind the hill,
With a saddened heart crept poor old *Bill*.

INMATES OF LESTER HALL.

(Continued from page 26.)

CHAPTER XXXIII.

DYING AND ALONE.

A scene of greater magnificence, or wilder grandeur, of more utter solitude, eye has never seen, pen has never described—for it would be impossible—nor artist painted. Through the dense thickness of the pine forest the light pierced and shone on the innumerable paths so rarely trodden by human footsteps; behind rose the great Carpathian range of mountains, snow-capped, and gleaming rosy-red in the light of the setting sun; above, the cloudless skies were serene and steadfast.

All was still and silent, save for the splashing of the waters from some distant mountain-torrent or the rush of the wind through the pine-boughs swaying them to and fro: these sounds alone broke the dense mountain solitudes where Lawrence Carewe lay, his life's blood ebbing slowly away, staining the grass where he had fallen and soaking into the moss. For some hours—it had been morning when the brigands had made their attack, and evening was drawing near—he had lain there motionless, his face stretched up to the light, his eyes closed, where they had left him for dead!

They had left him for dead; but life lingered in him still, feebly perhaps, a faint glimmer of vitality which might easily die away, but he lived, and now and then a long, shuddering breath showed that the hill robbers had been mistaken when they thought life was extinct. That his wounds were grave and terrible there could be no doubt; but Lawrence Carewe was a man of vast physical strength, and where less powerful men would have succumbed, he lingered still, and when the life-stream flowing from him ceased, consciousness returned in some slight degree; he opened his eyes slowly and looked upward at the waving pines above his head.

For some minutes he recollected nothing; then dimly, slowly, heavily, sense returned, and through the keen physical anguish he was suffering came the yet keener pang of his isolated and terrible position.

To die there alone, without one near to close his eyes: to hold a cup of water to his parched and blackened lips; to speak one word of consolation and comfort—the idea was an awful and ghastly one, and as it came before him, he shuddered through all his limbs. He had no fear of death; his profession had made him too familiar with it under every aspect for that, and life had not been such a very precious boon to him; but such a death as this was horrible—horrible—horrible! Alone in his last hours, or if not alone, in companionship too horrible to think of—of the beasts and birds of prey.

He knew there was little or no hope of succor; the forest paths were but rarely visited; the dread of the banditti, who concealed themselves, in its wild recesses, kept all away, save, perhaps some poor charcoal-burner, who had nothing to fear because he had nothing to lose. Oh! great Heaven! It was a bitter and sore extremity!

He was suffering greatly too; he felt choked and suffocated, parched with burning thirst; for the fever of his wounds was upon him, and he was powerless to reach the water, whose cool splash fell upon his ear and tortured him with the torture of Tantalus. No wonder that a cry broke from him of unutterable agony and suffering, a cry which fell unheard in the wild solitude where he lay dying.

The setting sun sank to rest behind the mountains; the moonlight stole through the leaves and fell upon the white and ghastly face of the man Cecil Lester loved.

The dawn broke in the east; the sunrise bathed the earth in its crimson and gold, and heralded another day. Lawrence Carewe's heavy lids raised themselves languidly, and his eyes watched the beauty of this wondrous awakening world, which he was so soon to leave, and he said faintly to himself that it was the last sunrise he should ever see, and his thoughts flew back to Cecil.

"Will she ever know?" he wondered, vaguely; "and if she knows, will she care? will she grieve a little? will she be sorry?"

And as he wondered, his hand stole feebly to his breast, and sought and found a little knot of faded blue ribbon, stained now with his heart's best blood—the knot she had worn in the bosom of her white robe on that night when he had declared his love, and she had refused it.

"Oh, Cecil! oh, my darling!" came softly from the pale lips, and into the dying eyes came one bright, sudden gleam of admiration and love—quenched almost directly by a terrible physical anguish, which turned him sick and faint.

Then he remembered once more the last time they had met. He saw her again in her wondrous loveliness, robed as Queen Guinevere, her shining hair falling around her as she crouched at his feet, whispering, "Forgive! forgive!" He saw her as she came towards him through the dim firelit hall, with haughty grace subdued to the softest tenderness; he could hear the low, sweet tones saying, "I love you—I love you, Lawrence!" and he recollected how, when she had held out her trembling hand, he had turned from her scornfully. Had she forgiven him that scorn? he wondered, faintly. Had she forgotten all that now? Was she married? Did she love Ernest, and was he, Lawrence Carewe, forgotten? And as he thought, his weak hand stole up again to the pocket-book in which lay that little bloodstained blue silk knot beside a photograph of Cecil, which he had seen one day in a shop-window and purchased. If he could but find strength to open the pocket-book and take out the likeness, it would help him through the dark valley. If he could die with his eyes fixed on the face of the only woman he ever loved it might make his terrible solitude less terrible—his death less bitter.

Very feebly—ah! how feebly—and with many a pause, he fumbled in the breast-pocket of the riding-coat he wore, and found the pocket-book; drawing it out with an immense effort, which exhausted him so much that he was obliged to pause more than once before he could open the leather case and take out the treasured *carte*.

It was a vignette—an ordinary, or rather a somewhat superior photograph; and as he looked upon the lovely face pictured there a moan of unutterable anguish came from the pale lips. The photograph had been taken before any shadow had fallen upon Cecil's life, and it represented her bright and smiling, with soft laces about her throat, and a flower in her hair. How beautiful she was—how beautiful! and he would never see her again!—he would pass out of her life, and be forgotten for ever! He might say now that he loved her; there was no one nigh to hear; and even her husband could not be jealous of the love of a dying man; and he let his dim eyes linger over the lovely, radiant face until a sudden blindness came over him; his lips moved faintly trying to frame her name—"Cecil;" he lifted himself slightly on his elbow, made one last effort to raise himself from the ground, then he fell back, his eyes closed, the hand holding the photograph fell nerveless at his side, and all was still!

* * * * * * *

Whitewashed walls, bare and cold, a low-ceiled room, white, spotless draperies; in a little niche a figure of "Charity," and on the wall one picture representing the Healing of the Sick. Such was the scene on which Lawrence Carewe's eyes opened, when he recovered, after a long, long trance of insensibility, to all outward things, during which he had been conscious only of intense suffering, burning pain, and intolerable anguish.

Now it seemed to him, in the intense weakness following on the long fever caused by his wounds, which had prostrated him for many weeks, that it must be all a dream—that for him the bitterness of death was past, that he would find himself in that other world.

He felt no pain now, only great debility, and a dreamy sense of comfort fell upon him as he lay there; it was evening, the chamber was in semi-darkness, for the small swinging lamp gave but a dim light; all was very still.

> "So still, so peaceful, when a soft-toned chime
> Broke on the evening silence for a time;
> Then trembling into silence, seemed to cease
> In deeper silence and more utter peace."

As the little silvery chime fell upon Lawrence Carewe's ear he started slightly, and turned his head on his pillows with a faint wonder in his feeble mind as to where he was, and how he came there; and at the movement a woman rose from a low seat by his bed, and came forward, bending over him with a smile and gentle word.

"Where am I?" he said, faintly.

"At the hospital at Estavia," she answered. "You have been very ill. You are better now, but you must not talk."

"At Estavia," he repeated, faintly. "How came I here?"

But the nurse shook her head with a smile, put her finger to her lips in silence, and gave him some nourishment, which Lawrence took passively and without resistance, for he was weak as a child; but as she turned away he put out one weak hand and caught her dress.

"Where is it?" he said, feebly, and the nurse looked at him questioningly without a word. "Did you take it from me?" he persisted. "Who brought me here?"

"You were found almost lifeless in the forest by a charcoal-burner of the neighborhood," she answered, gently. "He came to us for assistance, and we had you brought hither."

There was a moment's silence, but as she was turning away again he detained her.

"Where is it?" he went on, as impatiently as it was possibly to him in his weakness. "I had it—did you take it from me?"

Then she understood, and nodded.

"I will give it to you," she said, gently; "but you must not talk any more."

She moved from the bedside, and in a moment returned with the photograph of Cecil Lester, which they had found between his fingers when they had discovered him senseless and dying in the forest solitudes.

"Is not this what you want?" said the nurse, putting it into his weak hand."

And he thanked her with a faint smile, and fell asleep again with the smile lingering on his face still.

As the nurse had told him, he had been found in the forest by a charcoal-burner—a poor Magyar peasant—who had brought the tidings to the little hospital which a holy sisterhood had established near a little village on the borders of the forests and brought him to the hospital, where he had been tended with skill and care and his wounds dressed.

A weaklier man would have had no chance of escape; but Lawrence Carewe's great strength and iron constitution, added to the constant care and attention he received at the little conventual hospital, and saved him, and on that evening, when he awoke, the nurse dared to hope.

All through that night he slept calmly, peacefully, dreamlessly, with the smile on his lids still, the photograph lying upon his breast, held loosely between his fingers; and the kind nuns watched over him and bent over him to look at the beautifully-pictured face with a smile and a sigh.

"It is the likeness of the woman he loves," they said softly one to the other, and the color rose in the pale cheeks of the younger sisters as they looked; and if at their heart there was a pang at the thought that such a love as this they had put from them for ever, who shall blame them?

They were greatly interested in their patient: in their quiet, holy lives such an excitement rarely came to them. They themselves were of many nations—the greater number being Hungarians; but there were one or two soft-eyed Italian women; one bright eyed little Frenchwoman, the life of the sisterhood, and one blue-eyed English sister, who had been Lawrence Carewe's most constant attendant, and who was called Sister Monica.

The lives of these sisters led, far from the great world, were beautiful and blameless, but full of pathos. Many of them were women of culture, and position, who had left brilliant, luxurious homes to bury themselves in these solitudes, devoting their lives and fortunes to the good of the poor peasant population of the neighboring hamlet. The hospital was never without inmates, but these were poor and illiterate—scarcely removed from animals—and it was but rarely such a patient as Lawrence Carewe fell to their care.

More especially to Sister Monica was committed the care of the wounded stranger, for he was of her country. She could understand the ravings which fell from the parched lips; she could answer him if consciousness returned; she could soothe him with words familiar to his ears, and well and nobly did the sister perform her part.

The night wore on, the sick man slumbered softly, and it was only when the sun was high in heaven that he awoke once more, quite conscious this time, and able to say a few faint words of gratitude to his kind nurses, and the gentle nuns sent up a glad "*Te Deum*" of joy and gratitude.

Still he was very ill; for days he lay in a profound exhaustion, from which at times they feared he would never rally; and this utter weakness brought with it a depression of spirits which made Lawrence Carewe feel at times as if he could weep like a woman.

"It is a beautiful face," she said, gently, looking at the photograph. "Your sister, perhaps?"

"No," Lawrence answered, wearily.

"Your wife, then?"

"No; I am not married," he answered; but the nun's gentle curiosity was not easily checked.

"Perhaps one nearer and dearer than all others?" she said, with a little smile. "Will you not tell me her name? I could write to her, you know. She must be very anxious, very unhappy about you."

Lawrence shook his head, and turned away to hide the tears which rose slowly in his eyes; he was easily moved in his great weakness; but even grief seemed better than the apathy which had mastered him, and Sister Monica was not sorry she had spoken.

"Think how anxious she must be at hearing no tidings of you," she said, gently. "You have been with us over six weeks now, and if you correspond with her she will have wondered why your letters have ceased."

"We do not correspond," he said, faintly.

"And yet you love her very dearly?" she said, simply.

Dr. Carewe shaded his face with one weak hand for a moment; then he turned to her suddenly:

"Yes, I love her," he said, passionately. "I love her so wildly that my last thought, when I lay dying in the forest was of her—the last sight I wished to see was her face; but if I recover, I shall never be anything to her, nor she to me."

"Would you care to tell me the story?" she said, gently. "Sometimes it is a relief to confide in another; and in your religion the great consolation of confession is denied to you. Would you like to tell me about it?"

"Would you care to hear?" he said wearily. "If so, I will tell you, my sister, although it is a common story enough."

"Tell me," she said; with a little smile and a stifled sigh. "Even common stories are uncommon here you know."

"I hardly know how to begin," he said, with a slight, weary smile. "Shall I say 'Once upon a time?'"

"As you will," she answered, touched more by his attempt at gaiety than by his mournful sadness.

"Once upon a time," began Lawrence Carewe, with a sad smile, "there lived a man who had chosen medicine for his profession, had devoted himself to it with more than usual interest, who lived for little else, who cared for nothing else, for he had few relatives, and none for whom he cared. One day—an unlucky day for him—he went to a dinner party and there he met a girl, with whom he fell hopelessly and irretrievably in love—hopelessly, for she was a reigning belle, of high position, and hardly likely to accept a struggling physician for a husband! But he loved her, and madman that he was, he fancied at times, that he was not quite indifferent to her. It seemed to him, poor idiot, that she gave him sweeter smiles and gentler words than she did to others, and he dared to hope; he dared even one night when they were alone, to tell her that he loved her."—To be continued.

THE EYE-OPENER.

A SWINDLE practiced frequently on farmers, and occasionally on others, was illustrated the other day in the United States Circuit Court in Indiana, in the case of Woodbury and others against Kistler. A couple of agents of the "Windmill Pump Company," of Chicago, agreed with Kistler to send him certain machines for which, on their receipt, he would give his note for $540. The note was drawn, so as to have it ready to send on when the goods should come to hand. One of the agents kindly furnished an envelope, ostentatiously inclosed the note in it and, having sealed it, handed it to Kistler. When the latter, getting suspicious, opened the envelope a few days later, lo! it contained some waste paper, which the swindler had adroitly substituted for the note, which he afterwards sold to "innocent" parties, in the persons of Woodbury and others, who in turn brought suit for the amount of the note. These, in the character of "innocents," of course expected a favorable verdict; but the sympathies of the jury were so strongly in favor of the gulled Kistler that they rendered a verdict in his favor. We have, within the year, seen accounts of similar verdicts in like cases in many parts of the country, especially in the West. Swindles of this sort are quite common, the mode of carrying them out differing, of course, a trifle in each case. The "Western Medical Works," of Chicago, are said to use notes almost identical with that employed by the "Windmill Pump Company," so that it is by no means impossible that both concerns are "worked" by the same "parties."

Here are the names of a few more "parties" *in this city*, to whom the Post Office refuses to deliver letters or money orders on the ground that they are conducting their business in a way which gives reasonable cause for suspecting them of dishonesty. You see the Post Office doesn't like to call a spade, a spade, right out, or a swindler a swindler—it prefers to use more euphonious language. Gray, W., 506 Fifth Ave.; Hall, J. H. & Co.; Hamilton, Thomas J., *alias* Dr. Mattison; Hamilton, J. B. & Co.; Harris, James, care of Mr. Grampps, 253 East Church street; Harris, O. W.; Herrick, D. P. & Co.; Hubbell, W. F.; Jones Albert W., *alias* R. M. Boardman & Co; Kosbotb, R. J., *alias* Mutual Stock Companies, Nos. 1 and 2; Lawrence & Co., *alias* Adams, Brown & Co., and Allen, Jordan & Co., as well as Barnes, Garrison & Co. and W. D. Duff & Co.; Lee, W., care of Mr. Shepherd, 272 Third street; Lee, W., care of Mr. Huff, 127 Broome street; Lindauer, Charles F., 184 Mercer street; McCall, W. T.; McCaulay, S. A., 35 Broadway; Marcotte Company, 22 Church street; Martin, George, 172 Franklin street; Mattison, Dr. *alias* J. J. Hamilton, (this twofold individual is noticed above under H, also;) Nassau Banking Co.; Nathan, B., 179 and 838 Broadway; National Banking Co.; Noelke, Charles D. J., 238 Grand street; Perkins, Howitt, 11 Park Row and 297 Greenwich street; Porter, W.; Rand, B., 62 Harrison street; Rand, S., care of Mr. Warren, 78 Christie street; Russell & Co; Silver Mining Co; Smalley, C. & Gale, 32 Broadway; Standard Sewing Machine Co *alias* Alfred Cately (noticed under C); Taylor & Co.; Thatcher, Belmont & Co.; Tomlinson, James A.; Tully, J. F., 1215 Broadway, *alias* Bell, C. & Co.; Uplogton, G.; Veadero, Ciriaco, 69, 71, 73 Broadway, *alias* Martinez & Co.; Webb, Samuel, 126 and 267 Broadway, *alias* Wilson, W. S; Wright, T. Potter & Co; Williamson & Co.; Zsosch, Theodore, 23 Park Row and 861 Broadway. This comprises the BLACK list for this city until New Year's. There will be lots more during the coming year; for new "shearers" are always ready to "fleece" the credulous everywhere, and doubtless most of the old hands will appear under new names, so that it will take some time to identify them. Next week we will begin the list of exposed rascals elsewhere. Again we urge our friends to prevent any of their acquaintances from throwing away their money by sending it to such swindling concerns, at least until we shall have finished our list—some years hence. Of course, we have too high an opinion of our readers—that is, if they are not the sort who merely borrow the paper—to imagine for a moment that any of them would be foolish enough to be guilty of such a stupidity.

MAGAZINES FOR JANUARY.

THE ATLANTIC MONTHLY.—Contents—The Portrait of a Lady. XI.—XIV.; Ye Tombe of Ye Poet Chaucer—Westminster Abbey; Smith; Getting Married in Germany; A Winter Journey in Colorado; The Wives of Poets. I; A Symposium of Sixty Years Ago; Sociology and Hero-Worship—An Evolutionist's Reply to Dr. James; Within the Gate—L. M. C.; Friends: A Duet I.—III. Sara Bernhardt; A Look Ahead; The Long Dream; Illustrated Books; Zola's Essays; Some Political Novels; Books for Young People; Horace Bushnell; The Origin of Religion; The Contributor's Club; Books of the Month.

DENVER.—The city of Denver ends the plain travel. After the long journey through a region where the waves of civilization seem to die away among the alkali plains and antelopes, it is a strange sensation to find one's self once again in a full-grown and prosperous town, with Paris fashions in homes and people, and the look of thrift that usually comes only with time. It needs the iron wall on the west, to persuade one that he is on the very front of civilization, and that what he sees about him has been scarce a score of

years in its making. Except that the town is squared, and not close knit, it might belong in Ohio, or even in New England. There are shops that would do credit to Broadway, and houses that would fit in our oldest towns. In the people there is no more of the frontier than one may find in all the towns west of the Alleghanies. The laboring miner has been called to the mountains, and except that he comes here to spend his gains, or to show his "prospects" to men of capital, Denver is out of his range. Probably no other American city has such a noble site. The eastern slope of the Platte rises evenly and gradually from its sandy bed, until in a mile it gains a height of two or three hundred feet. From any house-top and all the streets one gets majestic views out over the vast eastern plain or over the mountains. A canal brought on to the ridges of the plain from the Platte canon supplies ditches, through which, in summer, water finds its way along the street, and by little sluice gates into the gardens that surround every house. For the time irrigation of this long-parched soil has brought about much sickness, so that the town seems to be temporarily unwholesome; but this condition must soon pass, and leave the city with almost ideal conditions of salubrity. Free from parching heats and withering cold, nearly snowless, with the sweet, dry air of the mountains and the oasis-like fertility that irrigation will in time give to its surroundings, it may hope for a noble future.—N. S. Shaler in January Atlantic.

APPLETONS' JOURNAL.—Contents: The Veterans of Yesterday, in Three Parts (Part First), from the French of Erckmaan-Chatrian; The Early History of Charles James Fox; Social Life Among the Ancient Greeks; The Influence of Art in Daily Life (V. Dress), by J. Beavington Atkinson; Political Somnambulism, by Professor J. R. Seeley; Holland and its People; Philosophy at Concord, by Mrs. A. B. Blake; The Earl of Beaconsfield's New Novel; Vers de Societe, by A. H. Japp; The Court and Literary Salons of Old Paris; Editor's Table: Eccentricities of Punctuation—New and Old Art Theories—Ex-Presidents as Senators; Notes for Readers.

The publishers announce their intention of adhering to their purpose of providing intelligent readers with literature of a permanent and sterling character on all topics which affect public welfare and general culture. "Large space," they say, "will continue to be given to Literary and Art Themes, to Discussions of Social Questions, to Critical and Speculative Essays, to Papers, original and selected, that in any way are likely to interest intelligent people, or which will reflect the intellectual activity of the age." A feature will be brilliant novelettes from French, British, and home writers; and considerable attention will be given to comprehensive and analytical reviews of important new books. A sub-editorial department has been added, under the title of "Notes for Readers," in which will be preserved many minor things in literature of interest to readers.

NORTH AMERICAN REVIEW—CONTENTS:—The Philosophy of Persecution, Professor John Fiske; Controlling Forces in American Politics, Senator George F. Edmunds; Atheism in Colleges, John Bascom, D. D., LL.D., President of the University of Wisconsin; The Ruins of Central America, Part V., Desire Charnay; Partisan Government, Wm. D. Le Sueur; Popular Art-Education, Professor John F. Weir, Director of the School of Fine Arts, Yale College; The Limitations of Sex, Nina Morais; The Mission of the Democratic Party, Senator William A. Wallace; Recent Philological Works, Professor F. A. March.

THE PHILOSOPHY OF PERSECUTION.—In the first series of his admirable essays on contemporary literature, M. Scherer reminds us that in 1841 Lacordaire wrote a biography of Saint Dominic, in order to prove that he was not the founder of the Inquisition. "Strange are the vicissitudes of opinion," observes the critic. "The Bollandists saw a title of honor where the modern Dominican sees a blemish which he would fain wipe away. While the former scornfully asked what there is criminal or shameful in delivering heretics to the torture, Lacordaire complains of the calumnies which have injured, in the eyes of posterity, the reputation of the chief of his order." The case is indeed a striking one; but the vicissitudes of opinion which it illustrates, are in no way temporary or accidental, but are symptomatic of a general and progressive change in the tempers and opinions of civilized men. The interval of a century or more between the earlier Bollandists and Lacordaire marked a new era in this change of temper, in so far as persecution, while losing much of its old cruel intensity, became also discredited and disavowed. It was during this interval that Lessing's theory of the relative truth of opinions, which destroyed the logical basis of persecution, began to make its way among cultivated minds. Though the persecuting spirit has not yet ceased to influence men's actions, it is no longer regarded as a trait to be proud of, but seeks to hide itself under specious disguises. Its manifestations, too, have become correspondingly feeble.—*North American Review for January.*

SCRIBNER'S MONTHLY.—Contents: Peter the Great as Ruler and Reformer. III. (Illustrated); The London Theaters (Illustrated); The Expensive Treat of Colonel Moses Grice: In Albania with the Ghegs (Illustrated); Jean-Francois Millet—Peasant and Painter. V. Conclusion (Illustrated); Tiger-lily. In three parts. Part III.; My Neighbor's Confession; Recollections of American Society. I.; The Charcoal-Burner; Glimpses of Parisian Art. II. (Illustrated); A Christmas Hymn (with two illustrations); Welsh Fairs (Illustrated); Christmas Song; The Bible Society and the New Revision; The Battle of Waterloo Encored; Topics of the Time; Home and Society; Culture and Progress; The World's Work; Bric-a-Brac.

CHARACTER, AND WHAT COMES OF IT.—Above all other things in the world, character has supreme value. A man can never be more than what his character—intellectual, moral, spiritual—makes him. A man can never do more, or better, than deliver, or embody, that which is characteristic of himself. All masquerading and make-believe produce little impression, and, in their products and results, die early. Nothing valuable can come out of a man that is not in him, embodied in his character. Nothing can be more unphilosophical than the idea that a man who stands upon a low moral and spiritual plane can produce, in literature or art, anything valuable. He may do that which dazzles or excites wonder or admiration, but he can produce nothing that has genuine value, for, after all, value must be measured by the power to enrich, exalt and purify life. If art were an end, in itself—if there were any meaning in the phrase "Art for art's sake,"—then what we say about character would not, or need not, be true; but art is not an end in itself any more than milk, or flannel, or tilth, or harvest. The further art is removed from ministry, the more it is divorced from it, the more illegitimate does it become. Pyrotechny attracts many eyes, and may excite a great deal of wonder and admiration, but when we talk about the value of fire, we only think of its service in the furnace and on the hearth.—*Scribner's for January.*

NOTICES of Magazines, &c., for December, 1880, were unavoidably crowded out.

INFLUENCE OF FLOWERS.—What can give an air of refinement to the meanest place more effectually than flowers? I know a row of dingy looking city houses, in front of which a few ragged, dirty trees drag on a miserable existence, but between the end house and a dreary blank wall there is a triangular bit of ground, which is literally carpeted with lilies of the valley whenever May comes round. They scent the squalid street and not a single pair of leaves come up without its attendant spray of blossom.

"HANDS wanted on boys' pants," is the daily advertisement in the newspapers. 'Twas ever thus from childhood's hour.

Ask any good doctor if Hop Bitters are not the best family medicine on earth. See notice.

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

CONCERNING DINNER PARTIES.

MARY WAGER-FISHER.

A DINNER party, to my mind, is the most enjoyable of all social interconrse, providing, of course, that the company be well chosen and the dinner a good one. The dinner need not necessarily be either sumptuous or expensive, but it should be good, well cooked and nicely served. Now that the Winter is well under way, and dinner parties a feature of the season, it may not be amiss to say something about them. As a rule, people who never have time to "go visiting" will accept an invitation to dinner, and be very punctilious, as they should be, in arriving in time; if the dinner hour is fixed at six o'clock, they come ten or fifteen minutes before six.

There are reasons for most things under the sun, and one reason for beginning a dinner with soup, is that it saves one from the waiting, and often awkwardness, attendant upon the carving of the roast, or rather it puts the company into a condition to wait—the sharpness of the appetite is assuaged by it, and the ball of conversation is set rolling. Soup should always be made the day before it is wanted, so that it may get cold, and the grease or suet, which rises to the top be taken off, for greasy soup is an "abomination." It is a very easy matter to have soup two or three times a week at least, if one is so disposed. For a soup kettle I find the granite-ware very nice, and most convenient, as it is light to handle and the soup can be allowed to stand in it any length of time. Of course, the kettle should have a closely fitting cover. Two or three kinds of meat make a better soup than when one alone is used, and bones always give a good flavor. While the juices of the meat are being extracted, the water should simmer—never boil.

After the soup has been removed from the table, and the host or hostess is carving the roast (it is to be hoped that the carving is done without the carver rising to his feet), *entremets* may be passed. These may be beef's tongue, spiced, raw or fried oysters, cold, boiled ham, head-cheese or slices of molded souse, from which the bones have been removed. For an elaborate dinner one serves fish after soup, but we are considering a dinner the materials for which may be found in the larder of most country dwellings. Spiced oysters are an appetizer enjoyed by most persons, and they will keep for three or four weeks in a cold place. If the roast is to be of beef, do not put water in the roasting pan; water converts the roast into a stew. If you want the beef extra-nice, cover the roasting pan with another pan of the same size. All sorts of meats cooked in the oven are the better for being roasted in a covered vessel. Some very good cooks dust the outside of a roast with wheat flour; others condemn the practice, so that it is quite a matter of taste. Among vegetables the potato holds a pre-eminent place and there are more ways of preparing it than there are days in the year, and there are as many *grades* of mashed potato! The most delicious mashed potato that ever came on my table was prepared by an Irish girl whose stupidity was most rasping. But her mashed potato was her redeeming feature, and as I now think of her in connection with that dish, her memory is a pleasant one. She had no better potatoes, or cream to put in them, than the house always affords, but she mashed and beat them until they were utterly smooth, and light like foam. A dish of them sent on the table hot never failed to elicit words of praise from some member of the family. If, after potatoes are mashed, they be put through a colander, and the long "strings" pile themselves high and loose in a dish, and if they are then set in the oven long enough to brown, they both look very nice and taste very good.

There must be a salad, and a very nice salad can be had in cold-slaw, if rightly prepared. When I was in Baltimore a few days ago, my hostess there set before me a slaw that I thought was dressed with oil, and was very nice. Of course, the cabbage was finely cut with a knife—not chopped—and here is the recipe for the dressing: a heaping teaspoon of flour, a small teaspoon of sugar, a saltspoon of mustard, half a teaspoon of salt, half a teacup of vinegar; stir all together and boil. When cold, add half a cup or more of cream, sweet or sour, and pour over the cabbage cold. Mix thoroughly. If you have no cream, use buttermilk. This will dress slaw enough for 10 persons. "What shall we have for dessert?" is always a question when a dinner party is on the *tapis*. Heavy, substantial pudding on the top of a hearty dinner should never be tolerated. What one wants is something fresh and dainty. Sponge cakes, with canned peaches, and coffee, make a nice dessert. Blanc-mange or plainly cooked corn starch served with preserved strawberries, or pine apple, with cream, is another very nice dessert. The Southern style of passing cream with preserved fruits, is now quite generally adopted, so that a pitcher of cream is much more essential to a dinner than is butter. (The French never serve butter with a "meat" dinner, and many of the more fashionable Americans are following the custom which is a good one). Unless the number of guests is large, two varieties in dessert are sufficient. Sponge cake is a favorite with gentlemen, and most, but not all, women like it. Apples and nuts are always in keeping with dessert; the apples should be made bright with a good rubbing, and the nuts be nicely cracked.

Apropos of coffee, although customary to serve it only with dessert, it is still in the best taste to serve it with the dinner when the guests are elderly persons who are accustomed to have it; there should be tea also for such as prefer it. A certain amount of formality, or order, rather, is necessarily observed in serving a dinner in order to prevent confusion, but unnecessary formality is stiff and unpleasant. There should be no hurry, and so long as the conversation and inclination of the guests warrant it, remain at the table. Two hours at dinner are not an over-prolonged meal, as "the feast of reason and flow of soul" is never more happy than after one has dined well.

About salt: if you are to invest in receptacles for salt, do not choose the "individual" salt dishes, but buy the salt boxes with perforated nickel, or silver covers, out of which the salt is sifted, like pepper out of a box. One feels tolerably sure then that the salt is clean, and has not been plowed into by the knife of his predecessor at table.

Napkins—never starch them in the slightest degree. Only a trifle of starch is permissible in a table-cloth. A napkin is a table towel, and a *starched* towel,—one might as well wipe himself on the back of an irate porcupine!

A long chapter might be written on the art of dinner-giving, but most RURAL readers understand how suitably to prepare and serve the meal; if not, they can overcome their ignorance by asking Domestic Economy any number of questions pertaining thereto and *by inviting the neighbors to dinner!* For there is nothing like practice and familiarity in such things to do them well. I cannot too strongly recommend dinner parties, especially in country neighborhoods where the social element needs development. One talks of better things, and is in a way ennobled by meeting with people dressed in their best bib and tucker. One never has too fine a frock to wear as a guest to a dinner party. Name guests whom you know to be "congenial to each other."

ONE WEEK FROM MRS. CLAY'S JOURNAL.

ANNIE L. JACK.

THURSDAY.—When I awoke this morning from a troubled dream the rain was pattering against the window, and the blinds rattled with a dismal shake. Over and over there rhymed through my brain a verse I had been reading the night before, that seemed to suit my mood.

"So chill the wind, and barren is the soil.
So weary am I that I fain would cease
From scattering seed. It seems a fruitless toil.
And a voice answered "God shall give increase."

I went into the kitchen before breakfast and found that by some mischance Janet had broken a large piece out of my best meat platter—at which she was looking with a helpless, puzzled air. "I'm no vara bad at breakin' delf" she exclaimed, as I entered, "I dinna ken hoo it happened." At that moment Lonsdale came in, threw his cap on a chair and sitting down a little too near the north window, he raised his arm with a jerk and succeeded in pushing his sharp elbow through a pane of glass. We had hardly time to exclaim, when little Alex. toddled in from the piazza with a large pot in his hand, that held my pet rose "Pearl of the Gardens" on which were half-a-dozen buds just opening that I had watched and tended carefully. He had never noticed it before, but now carried the trophy toward me, exclaiming joyously, "Mamma, here are some roses *a-rosing.*" It was a lovely plant; the pot too was fanciful and I started to catch it—but too late. It fell and the buds were either broken or spoiled. I felt like scolding. I think there is a new wrinkle started in my forehead, but just then Nora came in with quiet step, and a face full of sympathy, and I merely said "A Chapter of Accidents!" and lifted the "Pearl"; took the pruning knife and resolutely cut it up into four plants. So the present enjoyment was destroyed, but we will hope for the rose's future beauty. To Lonsdale I said "You must take the measure of the glass, and buy a pane, and then you can try your hand at glazing." I think this the best punishment a child can have for carelessness and I have always found it to work like a charm. The rain poured down unceasingly all day; the mud and damp clothes and leaden skies had a depressing effect, and not till evening, when we were fain to "stir the fire and close the shutters fast," did we recover from the effects of the day. But the peace and calm of evening restored our equanimity, and we could smile over our disasters while Alex. slept and Janet sang with Lonsdale to Karen's accompaniment that sweet and touching melody "Oh wert thou in the cauld blast."

REPAIRING TIN-WARE.

WE mend all our own tin-ware, from fixing a leaky pan to putting a spout on the tea kettle, both as a matter of convenience and economy. We used to do the work with a pair of tongs heated to melt the solder. Now we have a tinner's iron (which is not iron at all, but copper but, what's in a name). Our outfit consists of the iron, a bar of solder, a lump of resin and an old knife for a scraper. Sometimes we use muriatic acid in place of the resin, but if the articles to be repaired are not too much worn, or have been well scraped around the leak or broken place, the resin—which should be rubbed on before the solder is applied—will answer as well. To make repairs which will look as well as those done at the shops, requires practice, but by having the iron heated just enough to melt the solder readily, holding it—if you are a novice—directly over the place to be mended while it melts, even a child can do it very well. How much better to fix pans and the like in this way than to stop the leaks with putty or beeswax, as is often done! A. E. S.

QUESTIONS ANSWERED.

Haricot of Mutton.

I wish to learn through the RURAL, the art of preparing that excellent dish called *Haricot of Mutton*, which at one time could only be found at first-class restaurants in New York City. It was then regarded as one of the best dishes prepared by French cooks.

R. W. LUDLOW.

ANS. Two pounds of loin of mutton, or leg rounds, half pint of gravy, one medium-sized onion, carrot and turnip, or in place of the turnip substitute one cup of green peas, one dessert-spoonful of mushroom or tomato catsup, one glass of sherry or port wine, two tablespoonfuls of butter, a little browned flour, pepper and salt. Cut the mutton into strips three inches long by one wide, and fry with the sliced onion and butter till a nice brown. Have the gravy in a stewpan, and put in the fried meat. Simmer, tightly covered one hour. Then add the carrot and turnip, parboiled and sliced, or the peas, and boil twenty minutes. Thicken the butter used in frying with a little browned flour; add catsup, pepper and salt, pour into the stew, boil three minutes, add the wine, boil up and serve in a deep dish.

The Solid South, to a woman, are for Hop Bitters, using them as their only family medicine.

News of the Week.

HOME NEWS.

MONDAY, Jan. 10, 1881.

JUDGE OSBORN of Catskill has just rendered a decision against county Judge Thornton, of Sullivan, who was elected in 1878 for a term of six years. During the canvass, Thornton announced that he would serve the county if elected, for $1200 per year, the regular salary being $2,500. Thornton was elected and true to his promise has drawn only $1,200 a year salary. The unsuccessful candidate did not take his defeat kindly and brought a quo warranto suit against Thornton, claiming his offer to serve the voters of the county for less than the regular salary was in the nature of a bribe, and that he (Bush) should be installed in the office as the one who received the greatest number of legal votes. The case was tried last Summer but decision has just been rendered. Judge Osborn holds that the promise to take $1,200 only, was in the nature of a bribe, but he refuses to place Bush on the county bench, so that Gov. Cornell will have to fill the vacancy until another election...The New York Press Club gave their annual dinner at the St. Nicholas in this city last Thursday night. Speeches were made by Mr. Beecher, Gens. Grant and Sherman, Mayor Grace, and other notables ..The botanical department of Cornell University has recently received a gift of $10,000 from the Hon. H. W. Sage of Ithaca, N. Y.

Col. John H. George, a good authority, claims that New Hampshire's summer business foots up $6,000,000 a year. He bases his estimate on the railroad receipts from this business of $600,000, which he thinks is 10 per cent. of the whole. Other estimates place the aggregate amount at $2,000,000 per annum. One thing is sure, the business is great and growing. .....Chicago's prosperity is very remarkable. The past year has been marked by an enormous increase in its business. The bank clearings were greater than for the previous year by $336 000,000, the total sum being $1,693,000,000. The increase in grain shipments was very great; twenty-three millions of bushels more of cereals were handled than in '78..... A barber named Black went from Omaha to Sydney, Neb., with the avowed purpose of killing Detective James L. Smith, for having caused an article to be published in the Sydney Plaindealer reflecting on him. Black found Smith at the Lockwood House and fired two shots at him, whereupon Smith drew a revolver and shot and mortally wounded his assailant.....The plow manufactory of B. D. Buford & Co., at Rock Island, Ill., is burned, involving a loss of $250,000 on stock, machinery and buildings, besides throwing 400 employes out of work. The loss is one-fourth insured.

E. H. Luther, for some years prominently connected with the press of New England and lately a well-known member of the corps of Washington correspondents, died at Worcester, Mass., aged about 30 years. .....A grocer of Boston left $70 to be annually expended in caring for his dog, and that fortunate animal now eats sirloin steak three times a day and sleeps on a spring bed.....Lizzie Burton, the Illinois horse thief of 17, is very handsome, and in appearance perfectly modest; but she has been stealing horses ever since she was 10 years old.....The Yorktown celebration committee has selected Hon. Robert C. Winthrop, of Massachusetts, for orator, and James Hope, of Virginia, to deliver the poem.

Professor Felix Adler in his lecture at Steinway Hall on "Rational Education" made an earnest appeal to the audience to do their best to spread intelligence among the working people, asserting that upon the enlightenment of their children depends the safety of our institutions..... ..A fatal railroad collision took place recently at Lamokin Station in Pennsylvania, owing to a misplaced switch. Quite a number of the passengers were seriously injured, and in point of damage to railroad property it is said to be the worst accident that ever occurred in this country.

William A. Lightall, the oldest marine engineer in the country, died at Brooklyn last week, aged 76 years. He was born at Albany. He was engineer on the first Hudson river steamboat, the Clermont. .....The annual sale of pews in Plymouth church occurred in Brooklyn, Tuesday evening. The first was bought by Horace B. Claflin for $700 The high priced pews brought higher prices than last year. The total amount realized was $42,000 against $40,000 last year.....The frame spinners of the Webster mill, at Suncook, N. H., struck on Tuesday, and later the weavers of the Webster and Pembroke mills, numbering 200, also struck work. The strike was caused by a cut down of 10 per cent. on the 1st of January. It is likely that more will follow.....At Lockport, the magnificent Hodge Opera House building and the Gargling Oil building adjoining, burned early, Wednesday morning. Loss $150,000. The Opera House building was owned by John Hodge, and the Gargling Oil building by the Gargling Oil company, John Hodge, president.....The census returns are nearly enough complete to show that the population of the country exceeds 51,000,000 which is somewhat more than most people supposed. The increase in the last ten years will be about 13,000,000.

In New York City last year there were 344 failures, with $8,146,291 assets, and $19,291,582 liabilities.....Mrs. Harriet N. Cooper, a colored woman, died at Cheltenham, one of the suburbs of St. Louis, Mo., on New Year's day, aged 115 years. She weighed 400 pounds. Mrs. Cooper was the mother of 25 children, the youngest of whom is 62 years old. Her husband is 101 years of age and is still living.....Right Rev. Thomas Atkinson, Bishop of the Episcopal Diocese of North Carolina, died at his residence in Wilmington, N. C., Tuesday evening, aged about 73 years. He had been in feeble health for some months, but his death was unexpected.....Rev. O. H. Tiffany, Rev. Jacob Todd, and Mr. J. B. Long have been designated to represent the Philadelphia Conference in the Ecumenical Council of the Methodist Church, which meets in London, England, in September next..... ....At Wheeling, W. Va., the strike of the coal miners has caused the iron mills and glass factories to suspend, throwing 5,000 workmen out of employment.....Negotiations are in progress for the transfer of the Kentucky Central to the C., L., St. L. & C. management. The plan is to connect these two lines with the Knoxville & Ohio, running into Knoxville, and make a through line from Chicago and Cincinnati to the Southeastern railroad system.

The court-martial in the case of Cadet Whittaker has been ordered to convene on Tuesday, Jan. 18. Following is the detail for the court: Brigadier-General N. A. Miles, President of the court; Colonel M. A. Morrow; Lieutenant-Colonel Pinckney Lugenbell, First Infantry; Lieutenant-Colonel J. M. Brannon, First Artillery; Major Lewis Morrill, Seventh Cavalry; Major E. B. Sumner, Fifth Cavalry; Captain R. T. Frank, First Artillery; Captain Merritt Barber, Sixteenth Infantry; Major A. B. Gardner, Judge Advocate of the court..... Mr. Philo Parsons, of Detroit, Michigan, has given $50,000 to Olivet College, in that State.....Gen. Joseph R. Hawley, of Connecticut, has been presented with a handsome silver vase, at Washington, D. C., by the members of the late Centennial Commission.....The Rev. H. H. Hayden, the alleged murderer of Mary Stannard, is now working for the Folding Chair Company in New Haven.

[Walla Walla Watchman.]

Wise Words of a Willing Witness.

At the close of a mass meeting, according to the report of the same published in a La Grange paper, reference was made to the phenomenal efficacy of St. Jacob's Oil in the many painful diseases to which mankind is subject. We refer to the above as showing how strong a hold the Old German Remedy for Rheumatism has on the experience and good wishes of the great public.

FOREIGN NEWS.

England is about to withdraw from Candahar before the Ameer is firmly seated on his unstable throne. Blanqui, the chronic revolutionist, has just died in France. In Germany there is a national movement against the Jews, supported, it is said, by Bismarck, who does not favor it openly however. The Germans strongly object to the fact that the Hebrews are accumulating most of the money in the Empire; obtaining prominent places in the press, the theater and the government and generally pushing offensively aside their Teutonic neighbors. The movement will probably end only in temporary exasperation on both sides. Greece and Turkey are still disputing upon the territory demanded by the former of the latter. By last accounts the Powers had ceased to offer arbitration and Greece had determined to go to war with her far stronger neighbor, in the expectation that, in any event, Europe would not allow her to be badly thrashed.

In South Africa the Boers have rebelled against the British and driven away most of the troops stationed in their territory. They are the descendants of the original Dutch settlers of the Cape of Good Hope, who until lately maintained their independence by retreating northward as the British extended their dominion since their conquest of the Colony in 1806. When the South African diamond fields were discovered in their country—the Transvaal Republic—a few years ago, the British seized upon it, on the plea that the Boers could not control the turbulent diamond hunters—and now the sturdy Dutch Republicans are seeking to regain their independence. It will probably be a vain effort, as England is sending fresh troops to reconquer the land, and never willingly gives up a territory once acquired, however unjustly.

In Ireland the political trials of the Land League leaders still continue. Parnell, however, and the other Members of Parliament who have been indicted with him, have left Ireland to take their seats in Parliament where they have already begun to give the House of Commons a good deal of trouble by obstructing all business, by means of technical parliamentry motions. On the opening of Parliament the Queen's speech foreshadowed that the Government will ask for powers to inforce coercive measures in the disturbed districts, and at the same time introduce a bill for the relief of tenant farmers. Meetings of the Land League have been prohibited. The Pope has been writing to the Irish bishops, sympathizing with the people, but counseling peace and conciliation.

[Danville (Ill.) News.]

John Stein, Esq., City Brewer, referring to its valuable qualities, said to a News representative: "I have used St. Jacobs Oil in my family and recommend it to my acquaintances. It has always given the best satisfaction and is truly a wonderful remedy."

AGRICULTURAL NEWS.

THE French Commission on the Phylloxera lately held its final sitting under the presidency of the Minister of Agriculture and Commerce. It decided that no one had gained the $60,000 prize for an efficient remedy against the vine pest, although there had been a good deal of competition for the award. The remedies formerly approved by the Commission are still recommended—submersion, sulphur of carbon and supercarbonate of potassium. The introduction of American stocks into the Department of the Gironde was also authorized, and the continuance of State aid was recommended, to those Departments that are trying to reconstruct their vineyards by the use of stocks from this country. In certain Departments such attempts have hitherto proved very successful..... ....An insect destructive to the olive is fast spreading in France. In '78 its ravages were confined to Provence, but in '79 they extended to Languedoc and the Department of Herault. The egg is deposited in the olive. The larvæ gnaw the pulp, and make passages through it. The olive conveniently withers and falls, and the larva passes into the soil, there to transform itself into the shape of a chrysalis.....Texas is importing large quantities of Merino sheep. Importations during the past season have been much larger than ever before.....All over the South, indeed, especially in hilly districts, there has been a very considerable increase in the number of sheep the past year, and the movement is growing. Unusual attention is also being paid to the quality of purchases.....An imported Durham cow, the property of a farmer near Aurora, Ill., has given birth to six calves in less than two years. The bovines were born in pairs....Shanghai Pierce, the cattle king of Jackson County, Texas, lately sold 7,000 cattle for $16 per head.....Mr. Pierre Lorillard recently purchased in England the famous French stallion Mortimer, paying for him the sum of $40,000. The magnificent animal arrived here the other day on the steamship Italy.....The largest pair of mules received in St. Louis during the season, weighed 6,000 pounds together, and the height of each was 18 hands..... The amount of gate-money collected at the Birmingham, England, fat stock show, usually the largest in the country, was about $5,000. Nearly 50,000 visitors were present..... ..The Glucose Sugar Co., of Geneva, Kane County, Illinois, have just put in operation their large sugar works. The main building is five stories high, built of brick, is 66 feet by 180 feet. In addition to this is a stone wing, 60 feet by 60 feet, making one of the largest establishments of the kind in the State. At present, the company is using two thousand bushels of corn per day....

The American Pomological Society will hold its eighteenth biennial session in Boston on Sept. 15 '81 .....The National Farmers' Alliance is spreading in a satisfactory manner to judge by the number of local alliances which, it is claimed, have already been chartered. Twenty-five such organization are reported to have been already chartered in Kansas alone—which number entitles that State to a State organization.....There is more grain now awaiting shipment in Buffalo, N. Y., than has been there in forty years before at this time of year. The price which England is to be called upon to pay out of the pockets of the English, Scotch and Welsh taxpayers in order to settle forever the disquieting Irish land question, is, according to the Statist, the very modest amount of $1,500,000,000.....The Annual Farmers' Institute, under the auspices of the College of Agriculture of Illinois Industrial University, will be held at the University, January 26-28, 1881. It will be similar to those which have met with such favor in past years....Reduced railroad fare is expected. Programmes are being issued..... At the annual meeting of the International Dairy Fair Association, to be held in this city, February 8-9, an effort will be made to hold in connection with the meeting a dairymen's convention, in which prominent dairymen and cattle breeders will read essays or deliver lectures..... The annual meeting of the State Agricultural society will be held in Albany, January 19..... ....The manufacture of the little round Dutch cheese made from sweet milk, so popular in the retail trade, weighing from three and a half to four pounds each, is being undertaken in Illinois.

From Jan. 1 to Dec. 23, 1880, both inclusive, Kansas City received 244,216 cattle, 652,794 hogs, and 48,928 sheep.....New Zealand is said to be making great agricultural progress. The Government are introducing foreign fruit trees. Vine and tea growing will be tried in certain districts..... Shortly before his death the late Mr. Mechi became a bankrupt, not through his farming operations—although in the last few years of agricultural depression he lost money by his farm—but on account of failure in a business he had started in his old age in London. In his petition to the Court of Bankruptcy he described himself as of 439, Strand, dressing-bag and case manufacturer and cutler, and of Triptree Hall, Essex, farmer. The debts were upwards of £13,000, or $65,000, and the assets comprise stock to the value of £2,500 or £2,700, or $12,500 or $13,500, at Triptree Hall..... Advices from Buenos Ayres, dated Nov. 16, state that the wheat harvest promises to be the most abundant ever known on the Platte. An estate extending over 70 square leagues has been bought for a Liverpool merchant, and large purchases of land continue to be made on English account.... ....In New South Wales, according to advices of Oct. 16, prospects for the Summer were very favorable, and the crops were looking well. Pleuro-pneumonia was troublesome in the North and foot-rot in the West, but with these exceptions the stock of the colony was healthy and thriving.... ....In Queensland at the same date reports from pastoral districts are very encouraging.....In South Australia, according to advices of Oct. 30, the weather was variable, and complaints about rust in the grain crops were prevalent. "Take-all"—whatever that may be—was also causing anxiety to farmers.

The tenth annual convention of the North Eastern Bee Keepers' Association will be held in the city of Utica, N. Y., on the 2d, 3d, and 4th day of February, 1881. Four Gold Medals will be awarded for the best essays on "Wintering Bees," "Marketing Honey," and other very important and interesting subjects. Essays upon all the leading topics will be contributed by some of America's most eminent apiarists.

Mr. Joseph F. Armour, who died in Cincinnati on Wednesday, and whose funeral took place in Chicago on Saturday, was one of Chicago's best known and most active business men. He was born in Oneida, Madison County, N. Y., 58 years ago, and went to Chicago about 20 years ago. He was a member of the firm of P. D. Armour & Co., of Armour & Co., bankers, and of the firm of Planketon & Armour, the most extensive hog packers in the world. His brother, P. D. Armour, still remains to get up "corners" in pork. He leaves a wife, but no children.

The exports of Wheat and Wheat Flour have been from July to Dec. 1880, as follows:

	Bushels.
Oregon, July 1 to Dec. 20, 1880	1,272,254
California, July 1 to Dec. 22	10,362,463
Atlantic ports, July 1 to Jan. 1, 1881	103,042,886
Total, bushels	114,677,886

The Agricultural Department estimates the annual consumption for food and seed at 275,000,000 bushels, and available for export on the basis of its estimate of crop, 205,000,000 bushels.....The Grain trade at Odessa, per advices December 14th, 1880, was in a state of calm. The supplies this year had been less by 60 per cent. of Ghirka Wheat, by 55 per cent. of Rye and 30 per cent. of Barley than in 1879.

LYDIA E. PINKHAM'S VEGETABLE COMPOUND has rapidly made its way to favor among druggists, who have observed its effects on the health of their customers. Send to Mrs. Lydia E. Pinkham, 233 Western Avenue, Lynn, Mass., for pamphlets.

Tropic-Fruit Laxative, an agreeable substitute for pills and nauseous purgatives. One lozenge is the dose. Physicians prescribe it. Sold by druggists.

"My mother drove the paralysis and neuralgia out of her system with Hop Bitters."—Ed. Oswego Sun.

BURNETT'S COCOAINE is the best and cheapest Hair Dressing in the world. It kills dandruff, allays irritation, and promotes a vigorous growth of the Hair.

The Markets.

SPECIAL FROM THE CHIEF CENTRES.

Until Saturday, Jan. 8.

Boston.—WOOL—The market has been quiet this week, the sales comprising only 1,300,000 lb. of all kinds, and prices indicate no change. The large stocks in New York, Boston, and Philadelphia—some 50,000,000 lb.—make buyers hold off; but at this time last year there were very large supplies on the way, against a very limited quantity now. Of 95,000,000 lb. of foreign Wool received at New York and Boston last year there is very little left, and our manufactures must have consumed at least 100,000,000 lb. of foreign last year, while at the present time there is no margin for importation, or likely to be, unless prices advance. There is more or less English Combing coming forward, as the mills have been driven to purchase in Great Britain on account of the small stock of this grade on hand. The prices of X and XX Ohio and Pennsylvania have ranged from 47@48c.; Wisconsin and Michigan at 42½@44c., and Combing and Delaine at 48c@50½c. for Delaine and 50@55c. for Combing, as to quality. Unwashed Wools remain the same, with a moderate business, and Pulled Wool has been selling at 37@52c. for common and choice supers. There is no movement of any consequence in foreign. Holders are very confident that manufacturers will be in the market in force in a week or two, and that full prices will be realized.

Chicago.—WHEAT strong; No. 2 red Winter, 96½@97c; No. 2 Chicago Spring, 98½@98¾c; February 99¾c; March, $1.04½@1.05, May; No. 3 do., 85@87½c; rejected, 71@73c. CORN active and firm at 37c. cash; 37½c. February; 42½@42¾c. May; rejected, 33½@34c. OATS active and firm at 31c cash; 31½c. February; 35¾c. May. RYE firm at 87@88c. BARLEY easy at $1 12½. FLAXSEED in good demand at $1.18. PORK active and firm at $12.80@12.85 cash; $12.85@12.87½ February; $13 02½@13 05 March. Lard strong and higher at $8 62½@8.65 cash; $8.67½@8.70 February, $8 80 March. Bulk-meats active, firm and higher; shoulders $4 25; short rib $6.80; short clear $7 05. BUTTER—Creamery 32@34; dairy, choice, 25@28; dairy, fair to good, 22@24; ladle-packed 18@21; packing stock 13@16; roll butter 14@20; grease 8@10. CHEESE—Full cream, Sept. and Oct., 12@12½; Full cream, Aug., 9@9½; part skim 8@9; low grades 3@5. WOOL—Dealers look for a good trade as soon as as buyers are through taking an account of stock. Coarse to choice medium tub 47@50; coarse and dingy tub 33@44; fine unwashed fleece 21@30; coarse unwashed fleece 20@26; medium unwashed fleece 29@34; medium washed fleece 40@45; fine washed fleece 39@42; coarse washed fleece 35@37.

Cincinnati.—Wheat scarce and firm. No. 2 red Winter, $1.06. Corn heavy; No. 2 mixed, 41½@42c. Oats strong; No. 2 mixed, 36c. Rye dull; No. 2, 96½@97c. Barley in good demand; No. 2 Fall, $1. Pork dull and nominal at $13. Lard strong and higher at $8.60@8 65. Bulk meats in fair demand; shoulders, 4½c; clear rib, 7c. Bacon quiet; clear rib, 7¾c; clear sides, 8¼c. Butter is quiet and there is very little demand for Creamery, the fresh-made Northwestern being too high priced, and the Ohio stock has lost its fine flavor. Fancy Northwestern Creamery sells at 38@39c; good to prime Ohio do dull at 30@32, choice Dairy at 23@25, choice Western reserve at 22@23c, choice Central Ohio at 18@20c; premium to prime do at 16@17c, and common at 11@12c per lb. Cheese—Prime to choice factory at 12@21½c per lb, but some good late-made selling at 11@11½c, and Northwestern at 10c.

St. Louis.—WHEAT fairly active; No. 2 Red Fall, $1.00½@1.01 cash; $1.01½, January; $1.02½@1.02⅝, February; $1.04½@$1.05¼, March; $1.07, April; $1.07¾@$1.08¾, May; No. 3 do., 95c. bid; No. 4 do., 90c. bid. CORN, 36@39¼c., cash; 39½@39¼c., January; 38¾@39½c., February; 39¾c., March; 40¾c., April; 41½@41¾c., May. OATS, 30¾@31c., cash; 32¾@32¾c. February; 35¾@36c., May. RYE, 87c. PORK strong but slow at $12.75 asked, cash and January; $12.75, February. LARD, $8 45@8.50. BULK MEATS held higher; shoulders, $4 50; clear rib, $6.60; clear sides, $6.80; long and short clear active at $6.71½@6.75. BACON dull and unchanged. BUTTER—a light city trade only, mainly in choice. Dairy-packed and sweet, fresh well-handled roll. Creamery and inferior packed quiet, while near-by make (in rolls or pails) was very hard to place, and in large supply. We quote: Creamery at 29@32c., favorite brands held higher; dairy-packed—choice and selections at 23@25c.; medium to prime at 14c. to 20c.; common, 11@13c.—roll—Northern at 20c., country at 13c, for low to 17c. for choice. CHEESE—Full cream factory, 15c.; half creams, 12c.; skims, 11c. WOOL—Tub-washed—choice at 46@46½c.; fair at 44@46c.; lamb at 42½@43c.; dingy and low at 37@40c.; fleece-washed at 32@34c. Un-

washed—Choice at 29c.; inferior at 20c. for very poor to 28c for fair; Kansas, 22@26c. for light and 16@18c. for heavy; Texas at 23@26c.; merino—light fine at 20@22c; heavy do. at 17@18c.; Southern burry at 12½@13c. Burry, black and cotted, 5@10c, off.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Jan. 8 1880.

BEANS AND PEAS.—Receipts of beans are lighter and prices are fairly firm for prime straight marks of white. The heavy end of the crop is said to be here and sellers look for an early revival of trade. Peas plenty and dull; Wis. green $1.65@1.75, Southern B. E. $2 per 2-bush. bag.

Marrow beans prime $1.80@1.82, do. other $1 65@1.72, medium prime $1.70, do other $1.55@1.65. pea $1.60@1.75, white kidney $1.85@2.00, red do. prime $1 55@1.65, do. other $1.45@1.50, black or turtle soup $1.50@1.60; Lima $4.50@5.

BEESWAX.—Demand is confined to small lots, with 23@24½ quoted.

BUTTER.—The stock of butter has been estimated for the first of January at 9,436 pkgs. There is not much variation in the situation of the market compared with last week. Wholesale trade has not actually opened, but there is more feeling of inquiry than has been noted for a month or so. Shippers in this way clearly indicate that prices for the under grades they can use must come down to their bid before they will take hold freely. It is quite certain that they will be met in lines that have been dragging with the weight of not being good enough for steady home use and at the same time have been held too high for exportation. In fine grades of dairies transactions show a break: 25c. have been accepted and would again be for properly quoted at 27 a short time back. Western dairy is not showing as well as is to be expected in quality, and factory calls away a good deal of the cheaper class of buyers, especially at the relative quotations. Roll butter lower.

Comparative receipts of butter for the following periods:—

	Rects. pkgs.	Exp'ts, firkins.
June 1, 1880, to Jan. 1, 1881	1,000,128	203,351
June 1, 1879, to Jan. 1, 1880	1,025,415	282,279
June 1, 1878, to Jan. 1, 1879	944,129	184,854

Creamery, choice 33@33½c: good to prime, 30@31c; poor to fair 20@26c. State dairies, entire choice, 24@26c.; other, 23@25c.; firkins, 18@24c. State pails and half tubs, choice, 27@28c. fair to prime, 22@26 .; poor 18@20c.; Welsh tubs, choice, 24@26c; other 17@20c.; Western imitation creamery, 23@27c; dairy, fine, 23@24c; other 16@22c.; factory, fine, 20@21c.; other 13@18c. very poor western, 12@13c.; rolls 18@20c.

Receipts for the week 15,301 pkgs.

Exports for the week, 2 900 pkgs.

CHEESE.—The market has not shown new features, holders firm on a fairly active trade. Exports for the week, 24,755 boxes. Quotations are:

State factory, fancy, at 13½c.; do. good and prime, 12@12½c.; do. fair to good, at 11½@12½c.; do. h'f skimmed, 8½@10c.; Wisconsin factory, fine, 12½@12½c. do. good to prime, 11½@11½c.; do. fair to good, 10½@11½c.; Ohio factory, fine, 12½@12½c.; do. good to prime, 11½@12½c.; do. flat, fair to good, 10@11½c; do. poor to fair, 7@10c.

Comparative receipts and exports for following periods:

	Receipts, pkgs.	Exports, lbs.
June 1, '80 to Jan. 1, '81	2,380 502	103 034,314
June 1, '79 to Jan. 1, '80	2,156,414	92,425,716
June 1, '78 to Jan. 1, '79	2,087,165	105,042,208

Receipts for week, 8 617 boxes.

Exports for week, 24,826 boxes.

Liverpool cable, 65s., firmer.

Steam to Gt. Britain 30@35s.

Stock of cheese in this city Jan. 1, 214,200 boxes.

COTTON—There is a strong and fairly active market. Latest prices are for

January at 11.97@11.97c.; February at 12.11@12.12c.; March at 12.38@12.4 c.; April at 12.42@12.43c; May at 12.56c.; June at 12.66@12.68c.; July at 12.76@12.77c.; August at 12,82@12,84c.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted.

	Uplands.	N. Orleans and Gulf.	Texas.

Strict good ordinary	9 9-16	Middling	11 5-16

Receipts for the week, 37,202 bales, Exports do. 10,032 do.

DRIED FRUITS.—Business has been of a moderate character on account of the holiday period, with prices without marked change. Quotations are for Evaporated apples at 8¾@9¾c. for the better qualities; sliced apples at 6@6¼c. for good to choice North Carolina; 3½@4¼c. for Va, apples, 4@4¼c. for Tenn. do; 4½@5½c. for State do; 4½@5¾c. for western Ohio and Mich. Peaches at 31@32c. for evaporated peeled; 16c. for unpeeled do.; N. C. peeled at 20@21c.; for the better qualities, unpeeled peaches at 6¼@7¼c. for halves and 6¾@7c. for quarters. Plums at 15@16c. Blackberries at 8c. Cherries at 17¾@18c. Raspberries at 25c. Whortleberries at 12½@13c.

Receipts for the week, all kinds, 1,750 pkgs.

Exports for the week, 4,890 pkgs.

EGGS.—Receipts for the week 1,173 bbls., do last week 2,778 do. The market is higher than it has been for about seven years. Even limed have reached a scale that would be regarded as high winter rates for fresh; and there is no saying where the latter would have advanced to if a good offering of limed were not here. Selected State limed have been quoted nearly up to fresh on extra scant days. At the close the market is not so excited as the attractive figures it is thought will bring in all available stock. Near Points, doz., 43@45c; State and Penna., 37@38; Western fresh 37@38; Northern 36@36c; seconds or held 30@33c, State limed 30@31c; Western and Canadian 29@30c; Fall fresh eggs quoted at 3@4c. under late tald.

FRESH FRUITS.—Exports of apples, 3,626 bbls. Apples are dull and a trifle easier. The fine quality of evaporated draws away much of the cooking demand and retail and table wants are moderate with bad walking in the streets.

Mixed lots on the wharf, $1.50@1.75; Baldwins $1.75@2; Greenings, $1.62½@1.75 Spitzenbergs, $1.87½@2 12; Lady apples $3@4. Cranberries are nominal this weather, but prime are well held; Cape Cod bbls. choice $8; Other, $4@7; N. J. crates $1.62@2.25. Grapes are not wanted; Catawbas. 2@5c. Florida oranges continue dull and prices are full for average stock. Prime pkgs. have to be made so here. Some of the arrivals are in bbls.; these find no favor as the trade prefers the regulation half-bbl. case. Choice ½ bbl. boxes, 2.50@3; other, $2@2,25. Peanuts firm with a light supply: Va. hand-picked 4¾@5c, other 3½@4¼, snelled 3½@4¼c. Hickory nuts quiet, $1.50@1.62½ ₩ bush. of 50 ℔s, Black walnuts 40@50c. Pecans 8¼@9¼c., which is lower.

FLOUR.—There is a freer trading for export and home trade use, with prices firmer.

Latest prices are: $3.00@3.75 for very inferior to very fancy superfine State and Western; $4.00@4 40 for poor to choice extra State and Western, odd lots and lines; $4 40@4 65 for choice to fancy do.; Inferior to good white wheat, trade and family extras, $4 15@5.10; good to choice do. at $5.10@5.35; (very choice up to $6.25;) red and amber winter wheat, inferior to choice trade and family, at $4.15@5.85; round hoop Ohio, $4.25@4 75; and trade and family brands of do at $4.80@5.25, the latter for fancy; St. Louis $4.40@5.25 for inferior to good extra; $5.25@6.25 for good to choice, Minnesota clear, inferior to very choice at $4 25@6.00; Minnesota "straight," poor to fancy, at $5 25@6,75, and patent inferior to fancy at $5.75@8.25; city mill extra at $5.10@5.35 for ordinary to very choice for the West Indies; do. for England, $4.15@4.50 for poor to very choice spring wheat, and $4.65@5.50 for winter wheat product; do. trade and family extras, $5.65@6.75; do. for South America, $5.45@5.75; the latter for very choice; No. 2 at $2 85@3.50 for inferior to fancy.

Receipts for week, flour, bbls. 109 682; corn meal, do. 2,400; wheat, bush. 289,325; corn, do. 175,028; oats do. 99,600; rye, do. 17,050; malt, do. 37,500; barley, do. 36,000; beans, do., 12 752; rice, pkgs. 3,000

Exports for week, flour, bbls. 91,750; corn meal, do. 1,350; wheat, bush 537,800; corn, do. 121,075; oats, do, 2,000; peas, do. 18,233; beans, pkgs. 695; rice, 350.

CORN MEAL—Sales at $3.35 for Brandywine and $2.60@3.12 for yellow western.

GRAIN.—Wheat is in stronger demand for export and closed stronger. Latest prices are for

No. 1 white at $1.15@1.16, do. January at $1.14¾@1.15½, do. February at 1.16@1.16¾, do. March at $1.17¾@1.18¾, do. May at $1.18@1.18¾; do. steamer at $1.14, No. 2 white at $1.14; ungraded white at $1.12@1.16; No. 2 red at $1.16@1.18, do January option at $1 16¾@1.17¼; do. February at $1.18¾@1.19¾; do. March at $1.20¾@1.21¾, do May at $1.21@1.21¾; No. 3 red at $1.14½@1 15, ungraded red at $1 12@1.19¾, No. 2 Spring at $1.15.

Rye at 98@99.

Corn is higher on fair demand; latest sales are of New York No. 2 at 56@56¾c, do. January at 55¾@56¼, do. February at 56@56¾, do. March at 56¾@57, do. May at 64¼@65; No. 2 new at 55@55½c; ungraded mixed Western at 53@57, No. 3 at 53@53¼; New York steamer mixed at 51@51½. New York No. 2 white at 57c.

Oats are realizing an advance, with a fairly active demand: latest sales are of

No. 1 white 47@47½; New York No. 2 white at 45¾@46¼; No. 3 white at 43¾@44½; New York No. 1 at 43 New York No. 2 at 42¾@43¼, do. January at 43, do. February at 44¼@44¾, do. March at 45¼@45½, No. 3 at 42@42½, ungraded white Western at 43@46½, ungraded mixed Western at 42@42½, No. 2 Chicago at 43¼.

HAY AND STRAW.—The offerings are larger; low prices are well sustained.

Selected retail State hay $1.20@1 50 per 100 ℔s, other grades of timothy at $1.20@1.25 do, grades for railway and shipping wants at $1.05@1.10, clover mixed at $1.05@1.10, clover clear at $1@1.05 salt hay at 65@70c. Straw—long rye $1.15@1.20, short rye, wheat and barley 85@90, oat at 80@85.

Exports for the week 1,875 bales.

HOPS.—Demand has been slack this week, exporters especially indifferent, with prices essentially as quoted in our last.

Receipts for the week, 1,225 bales.

Exports for the week, 1,315 bales.

HONEY.—The holidays did not impart any snap to the market, and there is an urgency to sell, particularly for owners' account. Prices lower.

White clover, single, comb, 16@17c.; larger pkgs. do. 14@15c.; buckwheat 11@12c.; extracted 6@10c.

LEATHER.—Quotations for hemlock sole are 22½@23 for light 23½@25 for middle, 23½@25 for heavy and 21@22½ for good damaged.

MILK—Commission lots at Harlem R. R. platform have exceeded the demand and prices are low, especially for Winter. Cans of 40 qts. have ranged at $1.50@1.90.

OIL-CAKE.—Western is active at $29 per ton.

PROVISIONS—Have tended higher on an active inquiry.

Mess pork quoted at $14 for new, $13 75 bid; $14 asked for February. $13.90 bid and $14 asked for March. Bacon at 7½ for long clear and 7.65 for short clear. Beef at $9.50 for extra mess, $8 50 for plain mess, Beef hams at $17@17.50. Steamne at 9@9½. Tallow at 6¾. Lard $9@9.02½ for spot lots of steam; 9.10@9.12½ for January, 9 17½ for February, 9.22½@9 25 for March.

Receipts for week, beef, bbls. and tcs., 405; pork, 2,900 bbls.; cut meats, 35,111 pkgs.; lard, 21,888 pkgs.

Exports for week, beef, bbls. and tcs 1,604, pork, 4,275 bbls.; cutmeats, 12,371,153 ℔s.; lard, 6,675,687 ℔s.

POULTRY AND GAME.—Dressed poultry has fallen into ordinary Winter demand: large turkeys are slow. Frozen stock begins to afflict the market as the demand is not sharp enough to move even clean stock readily. N. J. turkeys range 12@13½c.; Phila 12@14c.; State, 11½@13c.; Western, 11@12½c,. chickens, Phila. 15@16c.; other prime, 13@15c.; poor to good, 8@12½c.; fowls, 8@12c.; duck, 10@15c.; geese, 8@12c., the latter Phila.

Live poultry is plenty for Winter but brings good figures. Chickens 11@12c, fowls, 9@10c; roosters, 6@7c, turkeys, 12@14c; ducks, best, 75@87c, other 50@70c. Geese, extra, $1.87½2; other $1.50@1.75. Pigeons ₩ pair, 20@25c.

The supply of game is ample for all wants and fair prices are ruling.

Canvas back $1.50@1.75, mallard 50@60c, black 40c, teal 40@45c. (blue wing); 25@30c. green do., common 25@30, quail ₩ doz trapped $1.75@1.87½, poor $1.25@1.50, partridges, ₩ pair 40@75. Grouse prime $1.12, drawn 80@$1; Rabbits, 20@25, hares, 20@30.

SEEDS.—Clover is quiet and firm: Western quoted at 9@9¼c, the latter for fancy; Timothy at $2.75@2.85.

TOBACCO—Export demand is very moderate and the home trade fair, with prices steady and unchanged.

SEEDLEAF.	Crop of 1879.
New England Havana seed	18 @25
do. seconds	10 @13
do, fillers	5½@ 7
Penn. assorted lots, fine	18 @22
Ohio assorted lots	7½@10
Wisconsin assorted lots	7 @10
Wisconsin Havana seed	16 @18

VEGETABLES.—Exports potatoes for week, 11,244 bbls. A good demand for export and local use has given the market considerable steadiness. Supplies almost stopped; stock here not oppressive.

E. Rose Eastern d.-h. $3@4.25, do. State, $1 87@2; do. in bulk $1.75@1.87; prolific do. $1.50@1.75; Burbank do. $1.50@2.00; snowflake do. $1.75@2; peerless State $1.50@1.75; N. J. $1.25@1.63, sweet Del. $2.75@3, Onions firm with some advance. Cabbage higher. White onions, $5@5.50 yellow, do. $3.25@3.50; red do. $3 25@3.50; Chester, $3.00@3.50; marrow squash, 40@50; Hubbard do. 75c.@$1; W. and R. turnips, 50@75c.; carrots, $1.25@1.50, cabbages, ₩ 100. $3@5; red, $7@9; celery ₩ dozen, $1@1.75.

WOOL.—The market is without much life as yet, but it is presumed that when the trade is fairly prepared for the new year's work, or when books have been balanced and last season's affairs wound up, a good degree of activity will set in. Prices are steady.

LIVE STOCK MARKETS.

NEW YORK, Friday, Jan. 8, 1880.

BEEVES.—Receipts for the week 11,171 head; do last week 9,775 do. The market was strong for all grades of cattle as late wants were only thinly supplied. Nothing left over. Bulls and dry cows sold at 2¼@4c, live weight, and 7@7½c; to dress 54@65 ℔s; common to fair steers 8@10c; to dress 55@65 ℔s; choice 11½@11¾c; to dress 57@58½ ℔s. One fancy steer made nearly 13c, to dress 70 ℔s.

SHEEP AND LAMBS.—Receipts for week, 28,365 head; do last week, 22,159 do. Good sheep are in demand; at this season the pelts have more or less to do in sales. Last month there were considerable losses for buyers of sheep owing to poor quality, and butchers have become very careful buyers. Poor sheep consequently dull. Many large dealing butchers pull the wool latterly. Sheep range 4@7c: lambs 6½@7c.

SWINE.—Receipts for the week, 3,133 head; do. last week, 22,490 do. Market for live dull and weak, $5.40 extreme; sale at $5 37½ for 100 ℔s.

Country dressed pork light 7¼@7½c.; medium, 7@7¼c.; heavy, 6¾@7c.; city dressed State 6½@7½, city dressed Western 6¾@6¾, Western dressed 6¼@6¾. Pork tenderloins 11½.

COWS AND CALVES.—There has been a fair demand at $30@60 ₩ head for good to common to prime State milkers. Receipts moderate but filling all wants.

VEAL CALVES.—Live have been scarce and prime have generally brought good prices. Coarse, heavy calves slow.

Live choice fed 8c. good to prime 7@7½, poor 6@6½. Mt. Holly range 5@8, heavy to prime light buttermilk, 4@5, grassers, 2½@3. Dressed calves have been plenty, as the weather is fine for shipping; choice 10@10½, other 8½@9½, very poor 4@8.

SEEDS

Our large illustrated Seed Catalogue of everything for the Farm or Garden MAILED FREE TO ALL. It costs nothing and may save you a great deal. Send for it at once. BENSON, MAULE & CO., 223 Church St., Phila., Pa.

The Farming World

16 page, 64 col. Illustrated, *invaluable* as a record of experiences—a photograph of the great farming world as it is—a journal of to-day. 150,000 readers, *liberal* to club-raisers—every surplus dollar of this year's income to them. *Special*—12 mos., 80 cents.—6 mos. 40 cents—3 mos., 20 cents.

Free for 1881 to every Minister, widow and couple married in 1880, who inclose 25 cents for postage. Send 3 cent stamp for specimen. THE FARMING WORLD, South Bend, Ind.

A PRINCELY OFFER —A— MAGNIFICENT GIFT.

We will send The Literary Guest (a mammoth illustrated Family Story Paper) on trial three months for only 15 cts. (or five 3c. postage stamps) and to each subscriber, we will give free one pair of elegant Oil Pictures, size 12x16 inches. We make this offer simply in order to introduce our Paper and Elegant Oil Premiums in new localities, well knowing where they are once seen hundreds more will be wanted. We shall offer as above the celebrated companion Pictures entitled, "The East," representing a scene in the White Mountains, and "The West," representing a scene in Wyoming Territory. They are the most beautiful and artistic Genuine Oil Pictures in this country, and in their perfection are very desirable works of art.

HOW WE CAN GIVE THEM AWAY.

These pictures were made as premiums to be given away with *The Aldine*, the finest art journal ever published, for $5 per year. As every one knows, *The Aldine* failed; it was through our agent that the whole immense edition of these chromos was secured at a bankrupt sale. It is only for this reason that we could offer these pictures as premiums with our paper. Every one who remembers *The Aldine* will know what would be the value of any picture which such a celebrated art journal would offer to its subscribers; and we confidently expect, offering these premiums, which were designed for a six dollar paper, with THE GUEST (three months for 15 cents), to secure at least 20,000 subscribers within the next two months. It barely pays for printing, postage, and packing. Address at once, CHASE & CO., Westboro, Mass.

Reading for the Young.

THE WINDMILL.

BEHOLD, a giant am I!
Aloft here in my tower
With my granite jaws I devour
The maize, the wheat and the rye,
And grind them into flour.

I look down over the farms;
In the fields of grain I see
The harvest that is to be,
And I fling aloft my arms,
For I know it is all for me.

I hear the sound of flails
Far off from the thrashing-floors
In barns with their open doors,
And the wind, the wind in my sails
Louder and louder roars.

I stand here in my place,
With my foot on the rock below,
And whichever way it may blow,
I meet it face to face,
As a brave man meets his foe.

And while we wrestle and strive
My master the miller stands
And feeds me with his hands,
For he knows who makes him thrive,
Who makes him lord of lands.

On Sundays I take my rest;
Church-going bells begin
Their low and melodious din:
I cross my arms on my breast,
And all is peace within.

HENRY W. LONGFELLOW.

FARMING FOR BOYS AND GIRLS.—NO. 9.

HENRY STEWART.

Methods of Draining.

WHEN the soil is found to be so wet that it cannot be worked in a proper manner and the crops grown upon it suffer, the farmer must take means to get rid of the water. This may be done in various ways, as by plowing the land into ridges, leaving hollows between the higher parts in such a manner that the water will run off from the ridges into the hollows and from these into a ditch at the lower part of the field, or by digging open ditches which gather the water from the surface and convey it away, or by tile draining, which consists in laying earthen pipes called tiles in deep ditches and covering them up so that the surface is made level and smooth as before. For some purposes the first is the best plan and it is a very cheap and easy method. In farming it is proper to look well to the spending of every dollar, but the cheapest is not always the best way. Sometimes it is better to spend more money at first that more may be saved in the end. It is the farmers' business to know when money may be spent with the greatest benefit, and the better he knows how this may be done the better farmer, and the more prosperous he will be.

The first method of draining may be used for meadows and grass lands that are not to be plowed, or for other lands that lie low but that have an open subsoil. It must not be lost sight of that some lands do not need expensive draining and that every purpose may be served by the cheapest method. To spend more money than is needed then, is waste. One cannot lay down rules for

FIG. 29.

every case. Something must be left for the farmer's own judgment and he should be able to apply general rules to special cases as they may occur. If a piece of land is so low and flat that there is no good outlet for the water, it may happen that the best thing to be done is to lift the land out of the water instead of vainly trying to draw the water from the land. This is what is done by ridging the land. For if a piece of level, smooth land is raised into ridges, as is shown in figure A, any water that may fall on it will run off into the hollows, and the land that is raised above these will actually be lifted out of the water and will be comparatively dry even when the hollows are wet. If the ridges and hollows are made in the direction in which the land slopes, however small that slope may be, the water will in time run off, although the fall or slope may not be more than a few inches on a whole field. With such a small fall open ditches or tile drains would be useless, so that in such cases this manner of draining is the best that can be used.

Where the fall is more than three feet, ditches or tiles may be used. Where land is cheap and open, ditches are not dangerous, or in the way, these may be used. Swamp meadows or rough pasture or meadow lands may be thus drained. Where land is valuable and is to be plowed every year closed drains are the best. These are dug three feet deep, very even in the bottom, so that there is no bend or hollow in the line of the pipes, the pipes are laid with the ends close together and then covered up and the ditches filled even with the surface. If there is any bend in the line of the pipes, sand or mud will collect (see fig. B) in them and close the drain. Such a fault should be avoided with the greatest care.

Water enters the tiles at the joints, and no matter how close they may be placed, the water will find its way into them. To prove this, let the ends of two tiles be ground smooth and fitted together as carefully as possible. Close the end of one tile with a cork and set the two on end, one upon the other, and try to fill them with water. The water will escape at the joint almost as fast as it can be poured in. And where water can get out of anything, it can get in with the same ease.

As an example of the benefit of draining, and also of the advantage of knowledge to a young man, the early history of a well-known farmer may be mentioned. John Johnston, late of Geneva, N. Y., began to farm more than 50 years ago. The first crops he raised were poor. He saw that the soil was too wet. He knew something about draining land, and procured tiles at a great expense, borrowing the money to pay for them and to do the work. He drained one field, and the next crop paid for the whole cost of it. Then he drained other fields until his whole farm was free from water. Fifty years after this he remarked to a friend, "I never made any money until I began to drain my land." He soon became a very successful farmer and a rich man. In his old age he loved to talk to young men and to give them advice about farm work. He did not boast of his success as being due to his own skill or wisdom, but would say that it was due to the use of drains in a very large measure. Thus he modestly gave the credit to the means he used, rather than claimed it for his own superior wisdom and enterprise. It is so with all great men, who are as modest as they are successful. Mr. Johnston, although he was a farmer, was a great man, and has done more good in his own modest way than many men whose names have made far more noise in the world. Mr. Johnston died recently at a ripe old age, but his name will ever be held in esteem by those who knew or have heard of him, because of the good which he has done by his example of skillful and intelligent farming, for he has pointed out the path by which any farmer, young or old, may reach success in his work, if he will only choose and determine to follow it.

THE HORTICULTURAL CLUB.

WELL, the holidays are passed, and were, doubtless, enjoyed by all the nephews and nieces. I shall be very much surprised, yes, and disappointed too, if I do not receive many letters from members of the Horticultural Club, telling all about the nice presents which Santa Claus brought them, and what gay times they had. Now the new year is with us, and let us one and all try to make it a "happy year" throughout.

The years pass away very rapidly, and it won't be long before the RURAL cousins will be men and women, but even then, we do not believe they will quite forget our pleasant Horticultural Club.

During this year we hope, and expect, to add many new names to our list, and we shall try to make the children's page more interesting than ever. UNCLE MARK

LETTERS FROM THE COUSINS.

DEAR UNCLE MARK:—I would like to belong to the family of cousins, will you accept me? I have three real cousins but no brothers or sisters. Eddie is the only little boy cousin in our family; he is two years and a half old, and we think him very bright. I would like to tell you about my dear cousin Alice and our uncle Henry. He is 22 years old, but he plays with us and makes as much fun as if he was as little as we are. I would like to tell you, also, about my dear, good grandpa and grandma, but mamma said I must not write too long a letter or you would not print it. Grandpa lives on a farm and I am there a great deal of the time. I like to ride the horses to water, and yesterday I helped to haul pumpkins. Oh, it was such fun; uncle Henry calls me Tommy, but I don't like that name, for I am a girl and that is a boy's name. Grandpa has taken the RURAL for five years and thinks he can't do without it. We thank you very much for the seeds. They all grew nicely. There is one plant which we are not sure of, as the name is rubbed off the box, but think it is the iris, the leaves look like gladiolus but there is no bulb, the roots being fibrous.

Mercer Co. GRACE BEATTY.

[It is the iris. Please give me the names of your town and State. Your letter should have been published before.—U. M.]

DEAR UNCLE MARK:—We are two children of an ex-Union soldier, living in Virginia. Our father came here from Ohio two years ago for his health. We live 17 miles from a railroad, and sometimes get pretty lonesome. We have taken the RURAL one year, and have always taken a great interest in the cousins' letters, and have long wished to join the Horticultural Club, and we would be two happy girls if you would please include us as members. We live in a northern settlement. We had a garden of our own this year, and intend to have one next. Father has plowed a small piece of ground for us, in which we have planted onions and potatoes. We plant them in the Fall here and cover them with leaves and brush till Spring. We had a very nice flower garden this year, but wish to improve it. The seeds we got from the RURAL did not do very well, but we planted them in the shade, which was the reason, I think. We each have a pet sheep and lamb. We like Virginia. The climate is much warmer in Winter, and the birds sing all the year round. They live in the thick pines and cedars. We like the RURAL very much, and all hands rush for it as soon as it comes in the house. Your would-be nieces,

Mecklenburg Co., Va. LIZZIE AND JOSIE.

DEAR UNCLE:—It seems to me a good time to report, now that the season's work is finished up, and one can see what the harvest has brought him. We usually have pretty good luck with the seed we receive from the RURAL, although the soil is not adapted for some, and others do not get the proper situations. We raised a barrel of Hebron potatoes this year, and our oats and cow-peas did well. The cow-peas are delicious eaten green; the only fault with them being that there was not half enough of them, but we saved seed enough, so that we will have plenty next year. Yours,

Mass. C. A. BUTTERWORTH.

P. S. The Phlox Drummondi and Chinese Pinks which you sent us had very fine flowers, and the musk-melon was almost ambrosial in its flavor.

DEAR UNCLE MARK:—I have just been reading the letters from the cousins. I didn't have any little garden, but my father has a large farm and I have to put in all my time on it. I go to school in the Winter, but in the Summer there is no school. I like flowers very much. I have a pair of very pretty pigeons, a shepherd dog and a pig. It has been very cold and we have had six inches of snow. One of our chickens got out of the chicken-house and walked around in the wet snow which froze into ice an inch thick on its feet. Last Summer we planted 25 acres of corn, but the drouth and the chinch-bugs destroyed it. I raised some peanuts last Spring, and they were very nice. I have not written for so long that I am afraid my letter will be thrown in the waste basket.

Your nephew, GEORGE.

Wash. Co., Ill.

[Will George please sign his name in full next time, and also give the name of the town in which he lives?—U. M.

DEAR UNCLE MARK:—My papa takes the RURAL and we like to read the cousins letters very much. We have a good many flowers and a large flower garden. We have also about 100 plants in pots. I have two brothers and three sisters, and we all love flowers. I do not go to school for we live two miles from town where the school is held. The seeds you so kindly sent last Spring to papa have all done well. Please may I ask you some questions about some house plants? When you send seeds to the cousins in the Spring, please remember me. FLORA.

Pella, Marion Co., Iowa.

[I shall be very glad to answer any questions, about flowers and plants, which may be asked.—U. M.]

UNCLE MARK is mistaken about callas requiring "thorough drainage." I used to think so, and have had tolerable success with callas in drained pots; but the first real triumph has been since we have grown the calla in a tight tub and kept at least an inch of water above the surface of the soil (mixed garden earth and fine peat) all the time. A plant in a bay window, within reach of my hand as I write, is a wonder of luxuriance in growth and foliage, and has been almost constantly in bloom for a year. It has a fine show for the holidays. Lately, to keep the two-year-old baby from playing in the water, we have covered the surface with moss (sphagnum) from the swamp.

Newport, Vt. T. H. HOSKINS, M. D.

UNCLE MARK:—If it will not be intruding, I would like to tell you what a thirteen year old girl has been doing through the Summer. I took the RURAL's advice and bought seeds; dahlia, gladioli, catalpa, etc. I now have twelve nice dahlia roots. The gladioli did not come up. The Chinese yam did not either, but I have twenty-five catalpa trees some three feet high, and they are quite a curiosity here. Now, if you can tell me where I can get some chestnut trees I will try them. I have planted chestnuts several times, but rabbits take them. ETTA A. SHAFFNER.

Wellman, Wash. Co., Iowa.

UNCLE MARK:—I am a boy thirteen years old, and have a list of four subscribers. I have worked hard to get them. It seems to me that a man can do better in getting subscribers, for people seem afraid to sign for a boy. I would like a scroll saw. How much more money will I have to send to get it, than the four subscriptions amount to? CHARLES POOLER.

Meridian, Cayuga Co., N. Y.

P. S.—My father has taken your paper for twenty years. C. P.

[We can send you a very fine scroll saw, all complete, for a club of ten subscribers. U. M.]

DEAR UNCLE MARK:—I am eleven years old and go to school and like it very much. I live in Western Kansas, but my mother says she don't like it as well as New York State because we have so many hot winds. Father planted a good many garden seeds, and so did I, but it was so dry that they didn't come up. I love flowers and so does mother. The seed you sent out did not grow. Mamma had five old hollyhock plants which bloomed last year and were very pretty. Father has 100 chickens and some cows. He has taken the RURAL all but one year, since I can remember.

Ellis Co., Kansas. JEROME BRIGHTMAN.

DEAR UNCLE MARK:—My brother takes the RURAL and I like to read the letters from the cousins. I am a Connecticut boy, but have lived in Kansas ever since I was two years old, I am nine now. There are some very pretty flowers on the prairie, and I like to gather them and make bouquets. We have in the Spring a great many kinds of roses, red, yellow, pink and scarlet, and some little tiny white ones. I would like to join the Horticultural Club, and when you distribute flower seeds, please remember me. HOWARD T. ACKLEY.

Coffey Co., Kansas.

DEAR UNCLE MARK:—I am a little girl ten years old. I would like to join your club. My papa has been taking the RURAL for sixteen years. I have a canary bird, and my mamma has quite a number of house plants. Please remember us when you send seeds. Your niece, LILLIE M. THOMAS.

Davenport, Scott Co., Iowa.

DEAR UNCLE MARK:—I am a little girl seven years old and would like to join the Horticultural Club. I have no little brothers or sisters like so many of the little cousins, but I have some pets. I have a cat named Tom that I can dress up with my old apron. I also have a nice doll that I call Jessie. I have never raised any flowers, but my papa says if you will send me seeds that I may have a little garden of my own. My papa has taken the RURAL a long time, and mamma reads me all the letters from the cousins.

West Camden, N. Y. MARION CURTISS.

Malarial fever, Ague and Biliousness will leave every neighborhood as soon as Hop Bitters arrive.

Sabbath Reading.

WAIT TILL TROUBLE COMES.

BY R. E.

We sit down, way-worn and weary,
And think of the days to be,
And forget there's a silver lining
To all the clouds we see.
We fret over care and trouble
Before it is begun,
And think of stormy weather;
We forget the warm, bright sun.

It were better to wait, my brother,
Till the trouble and care is here;
Why should we cloud the sunshine
When the day is bright and clear
By dreading what may await us?
Better to laugh and sing,
And bid the bird of foreboding
From these hearts of ours take wing.

What was the sunshine made for
If not to make us glad?
We are doing wrong to waste it
In repining, idle and sad.
We are doing wrong to squander
The sunshine of to-day
In foreboding that to-morrow
The sky may be cold and gray.

Then I pray be wise, my brother,
As you climb the hill of life,
Enjoy the time to the utmost
That is free from care and strife,
Thinking only of blight and failure
We would sow no seedtime grain:
Make use of to-day's glad sunshine,
And for to-morrow's rain.

To-day is ours, but to-morrow,
Perhaps we may never see;
Then why should we borrow trouble
For a time that may not be?
Leave to the future, brother,
The trouble it may bring;
In the sunshine that God gives us
Be glad of heart, and sing.

DR. ARMITAGE'S ADDRESS.

EXTRACT FROM THE ADDRESS DELIVERED AT THE FUNERAL OF DR. CHAPIN AT THE CHURCH OF THE DIVINE PATERNITY, NEW YORK CITY.

EVERY thoughtful and careful reader of the life of the Lord Jesus will gather this great truth to his own spirit; that the teaching of the Lord Jesus in the doctrine of the virtues which he established and the great principles which he laid down for the government of the Church and the world, were the outcome of his own nature, the embodiment of his own characteristics. And so in a true Christian spirit and a true Christian doctrine you have the true Christ life. I apprehend that this is true of all men, but pre-eminently true in the case of the loved disciple of Jesus who sleeps at our feet this morning. Sometimes you can find in the acts and utterances of men a simple act or a simple utterance which is the embodiment of the existence of that man. And in dropping my eye yesterday upon the first book that was published as the product of Dr. Chapin's mind, a volume of sermon's, I find just such an epitome as this in the preface. It seems to me that if you will look at a few sentences you will see that they embody a biography of the man, although they were written as far back as the year 1841. This great preacher says:

"The great end of preaching is to reform the life, to reconcile man to duty and to God. The great principle to be propagated and established in the souls of men is not this or that particular *ism* but the spirit of Christ. Without this no denomination can be right, no society can flourish, no soul can live."

Those utterances were the outcome of his life. That is the text that he wrote in 1841, and here, to-day, we have the comment of his work in 1880. And I don't think, if you should fill a volume with his biography, you could find the principle that moved him, the convictions that held him in a normal inspiration, the broad philosophical or deep and high motives and purposes that controlled him, so perfectly illustrative of his inner life as these words uttered when a young man, and the corresponding work of his life throws a brilliant ray upon every syllable.

Two weeks ago to-day, just before the setting of the sun, I went from the side of a loved friend whom I had buried, to the bedside of Dr. Chapin, not supposing that a couple of brief weeks would bring us to the parting and him to the dust. As is my custom in entering a sick chamber, especially the sick room of a friend, I enter very cheerfully, trying to carry a beam of sunshine if I think it is possible, and utter a word of cheer. How beautifully he greeted that visit. After a short conversation I said, "Doctor, do you realize now the sweetness of the promise of Christ in your broken condition?" He looked at me with the simplicity of a babe; but I saw a tear moisten his eye and a little tremulousness mingled with his voice, and he said, "My dear brother, what should I do without Christ. Christ is everything to me now." So he spoke of the loving Redeemer; I said, "Well, then, may I have this consolation, Doctor, of knowing that you who have been in the ministry so long, labored so hard, done so much to lift up other minds and pour consolation into disconsolate hearts, that you to-day realize the same breadth and fullness and sweetness of consolation in Christ that you have ministered to others?" He simply made this answer: "Doctor, Christ to me, is all in all."

CHRISTIANS are the light of the world just in proportion as men see their good works, that their works are good. Not works done to be seen of men, but works so manifestly good that men cannot help seeing them. They attest the saving and divine power of the gospel, and thus convince men and lead them to Christ. As the beams of the moon tell us of the unseen sun, so do such lives reveal to men the unseen God. The divinest, the most supernatural thing connected with Christianity in the world, is a godly life.

PERSONAL ITEMS.

Adelina Patti will come to the United States next fall for a concert or opera tour.

Ex-Senator Patterson has hung up his carpet-bag in New Hampshire, where he is State Superintendent of Public Schools.

General Hazen is a cousin of Mrs. General Garfield, their mothers being sisters. These sisters were daughters of a Vermont Methodist clergyman.

Colonel James G. Fair gave $6,000 in Christmas presents to the various charitable associations of San Francisco and a check for $5,000 to a governess in his family who made Christmas her wedding day.

Sojourner Truth, now well over a century old, declares that she shall not die until American women can vote, for she couldn't bear to go into the heavenly kingdom without being a full citizen of the American Republic.

Reuben Springer, of Cincinnati, indulged in Christmas gifts of unusual size; he gave a United States bond for a thousand dollars to each of eight charitable institutions in his city; each of the faithful servants of his household also received $1,000.

With the retirement of General McClellan, New Jersey will have seven living ex governors, the others being Price, Newell, Parker, Ward, Randolph and Bedle. Only four ex-governors of the State have died since 1842, namely, Stratton, Haines, Fort and Olden.

Mr. J. R. Keene has purchased a farm in Shenandoah county, Va. It is one-third of the old Mount Airy estate, once owned by General Gilbert S. Munn, but now known as Strathmoor. There are about four hundred acres of meadow land in white clover, blue grass and timothy.

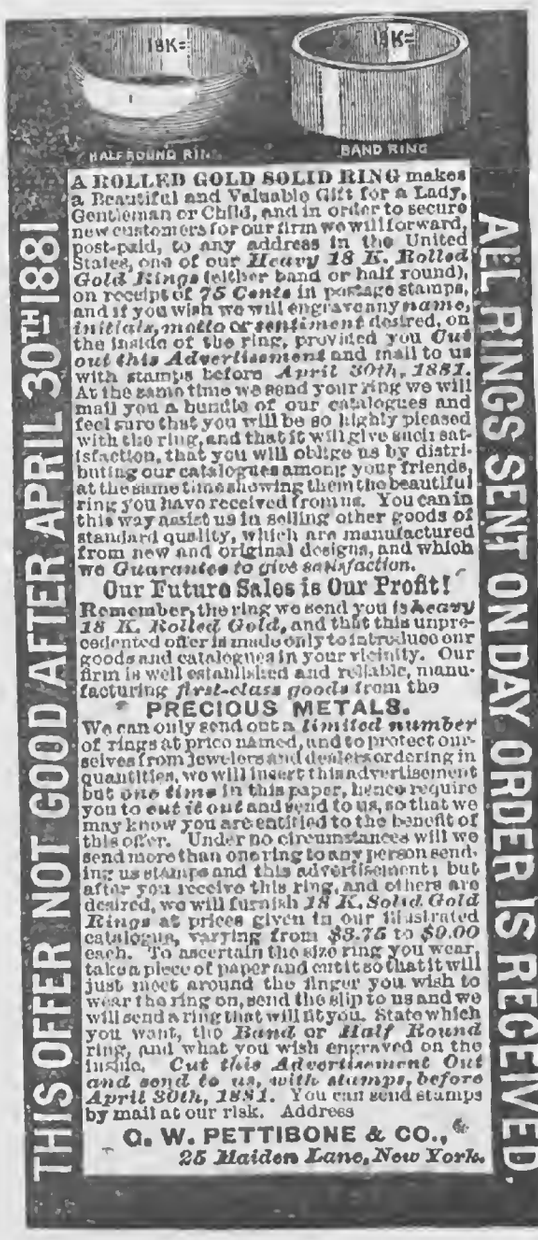
Colonel W. F. Elkin, who died in Illinois a few days ago, was the last but one of the famous "long nine" of the Illinois Legislature of 1839–40. Abraham Lincoln was the tallest of the nine, whose aggregate hight was precisely 54 feet. Ninian W. Edwards, of Springfield, was the one survivor.

The Rev. Mr. Mayo, of Boston, had an interview with the President in regard to his contemplated tour in the South, in the interests of a movement for strengthening the common school systems of that section. The President signed a strong letter of commendation of his plan. Mr. Mayo also had extended consultations with ex-Governor Brown and Alex. Stephens, with Randall, Gibson and Mr. Atkins, and all expressed thorough sympathy with his purposes.

PHYSICIANS OF LONG PRACTICE.

In regard to the administration of "Compound Oxygen," the new remedy for chronic ailments, which is attracting so much attention, we wish to say that we are physicians of long practice and experience, not venders of a patent medicine. Our business is to cure diseases. There has come into our possession a knowledge of the way in which to combine oxygen and nitrogen, the two elements which make up our common or atmospheric air, in such proportions as to render it much richer in the vital or life-giving quality. It contains no medicament, unless the elements of pure air are medicines, and its administration introduces nothing into the body which the system does not welcome as a friend, accept with avidity, and appropriate as entirely homogeneous to itself. You will find many of these results recorded in our Treatise on "Compound Oxygen," which is sent free. Address Drs. Starkey & Palen, 1109 and 1111 Girard St., Philadelphia, Pa.

Miscellaneous.



THE GREAT
GERMAN REMEDY.
FOR
RHEUMATISM,
Neuralgia, Sciatica, Lumbago,
Backache, Soreness of the Chest, Gout, Quinsy, Sore Throat, Swellings and Sprains, Burns and Scalds, General Bodily Pains,
Tooth, Ear and Headache, Frosted Feet and Ears, and all other Pains and Aches.
No Preparation on earth equals ST. JACOBS OIL as a *safe, sure, simple* and *cheap* External Remedy. A trial entails but the comparatively trifling outlay of **50 Cents**, and every one suffering with pain can have cheap and positive proof of its claims.

The Literary Revolution

"Peace hath her victories, no less renowned than war." This is acknowledged to be the most successful revolution of the century. Is it not also the most important? It brings knowledge and culture within reach of all who aspire to them. Books supply the most permanent and fruitful sources of enjoyment. Whose will may now possess them. The list of publications already comprises nearly 175 volumes of standard works, and the number is being increased with unprecedented rapidity. You can get full descriptive catalogue and an illustrated pamphlet telling how books are made, and describing the setting

Type-Setting of type by steam, free on application, and you can get the books themselves from the leading bookseller in every town. The comments of Press and People are most noteworthy. "The day of cheap and good books is once more with us, and the American Book Exchange merits the praise for it."—*Episcopal Register*, Philadelphia. "We can only repeat our hearty commendation." *Traveler*, Boston. "Is doing wonders in book-making. We pronounce them the best books for the money that ever came to our notice."—*Watchman*, Boston. "Has some rich relative left you a colossal fortune which you are spending in publishing books for the people at nominal prices! [illegible] your taste. But wont the old-line publishers be glad when it is gone?"—queries a facetious by steam,

By Steam.

correspondent. "At these rates every man may, and [illegible] man should, have a library."—*Alliance*, Chicago. "Your company is worth more to the common people than the Peabody Fund," writes a Southern educator. "The American Book Exchange is doing a very remarkable work."—*Journal*, Boston. "Other publishers may sneer at them, but so long as the Exchange publishes a book at one-tenth the cost at which it is offered elsewhere sneers cannot hurt them."—*Courier-Journal*, Louisville. "Anybody can afford to own a cyclopædia now."—*Press*, Ellenville, N. Y. "Cheap beyond all precedent in book-making." *Capital*, Columbus, O.

Amazing Offer!

Chambers's Encyclopædia.

Ten years ago this great work could not be had for less than $50.00. The Literary Revolution gives you a verbatim reprint of the last London edition in 15 elegant and handy cloth-bound volumes, small but clear type, for $7.50. In this style it is now complete and being delivered to purchasers—in immense quantities, of course. The same work is also being issued in large type, under the title of the "Library of Universal Knowledge," in 15 large octavo volumes, the price in cloth binding being $15.00, and in half Russia, gilt top, $22.50. To this edition an able corps of American editors are adding about 15,000 topics not treated in the original Chambers's, thus more thoroughly adapting it to the wants of American readers, and making it the largest Encyclopedia ever published in this country—about 10 per cent larger than Appleton's (price, $30.00), and 20 per cent larger than Johnson's (price, $50.00). In adaptation to the wants of general readers Chambers's has always ranked at the very front. Now thoroughly revised, it is several years the latest in the field. You can want nothing better. Of this large type edition the first seven volumes are ready January 10, 1881, and the remaining volumes will follow about two each month, till the work is completed. Notwithstanding that our prices are low beyond example, it is our custom to give special inducements to those whose orders are soonest received.

Only $7.50.

Large Type.

American.

2 Cents Lost Accordingly, the price for the 15 volumes in cloth, orders with cash to be received by us on January 1, is only $11.00, and for the half Russia, gilt top, $16.50. The price of the edition in cloth will be advanced two cents every day (Sundays included) after January 1, and the price of the half Russia, gilt top, three cents every day, till the full price of $15.00 and $22.50 is reached. You will therefore readily see the

Every Day That You Delay.

wisdom of sending your order promptly when you have read this. The volumes now ready will be sent to you at once, and the remainder as issued, or as you may direct. As above stated, the books may also be ordered of the leading bookseller in every town. Liberal terms are allowed to clubs. Descriptive catalogue sent free on request. Remit by bank draft, money order, registered letter, or by express. Fractions of one dollar may be sent in postage stamps. Address

Humorous.

MRS. PARTINGTON says that her minister preached about the parody of the probable son.

PATRICK on the zebra—"Phat kind of a baste is that?—the mule wid his ribs on the outside of his shkin entoirly."

DON'T judge a man by the silk umbrella which he carries. He may have just left a cotton one in its place.—Yonkers Statesman.

WHY are true lovers' visits like a successful newspaper? Because they commence weekly, then become semi-weekly, then tri-weekly, and then daily with Sunday supplement.

A LITTLE GIRL had a penny given her to put in the collection box at church. When she dropped in the coin she exclaimed, "That's the way the money goes, pop goes the weazel!"

AN Irishman who was very near-sighted, about to fight a duel, insisted that he should stand six paces nearer to his antagonist than the other did to him, and they were both to fire at the same time.

IF a newspaper should contain all the things that all its readers want it to print it would have to be bigger than a bedstead. If it should leave out all its readers do not wish it to read, it would be a blank page.

A PROFESSOR asked his class, "What is the aurora?" A student, hesitating, replied "Professor, I did know, but I have forgotten." "That is sad, very sad," rejoined the Professor. "The only man in the world that ever knew has forgotten it."

Wretched, Indeed,

Are those whom a confirmed tendency to biliousness, subjects to the various and changeful symptoms indicative of liver complaint. Nausea, sick headache, constipation, furred tongue, an unpleasant breath, a dull or sharp pain in the neighborhood of the affected organ, impurity of the blood and loss of appetite signalize it as one of the most distressing, as it is one of the most common of maladies. There is, however, a benign specific for the disease and all its unpleasant manifestations. It is the concurrent testimony of the public and the medical profession, that Hostetter's Stomach Bitters is a medicine which achieves results speedily felt, thorough and benign. Besides rectifying liver disorder, it invigorates the feeble, conquers kidney and bladder complaints, and hastens the convalescence of those recovering from enfeebling diseases. Moreover it is the grand specific for fever and ague.

A MEDICO-FRUIT LOZENGE OF THE PREMIER CLASS.

TROPIC FRUIT LAXATIVE

Prepared from tropical fruits and plants.

Try it once, and you will esteem it highly as a safe and effective remedy.

Is the Best and Most Agreeable Preparation in the World

The Herdsman.

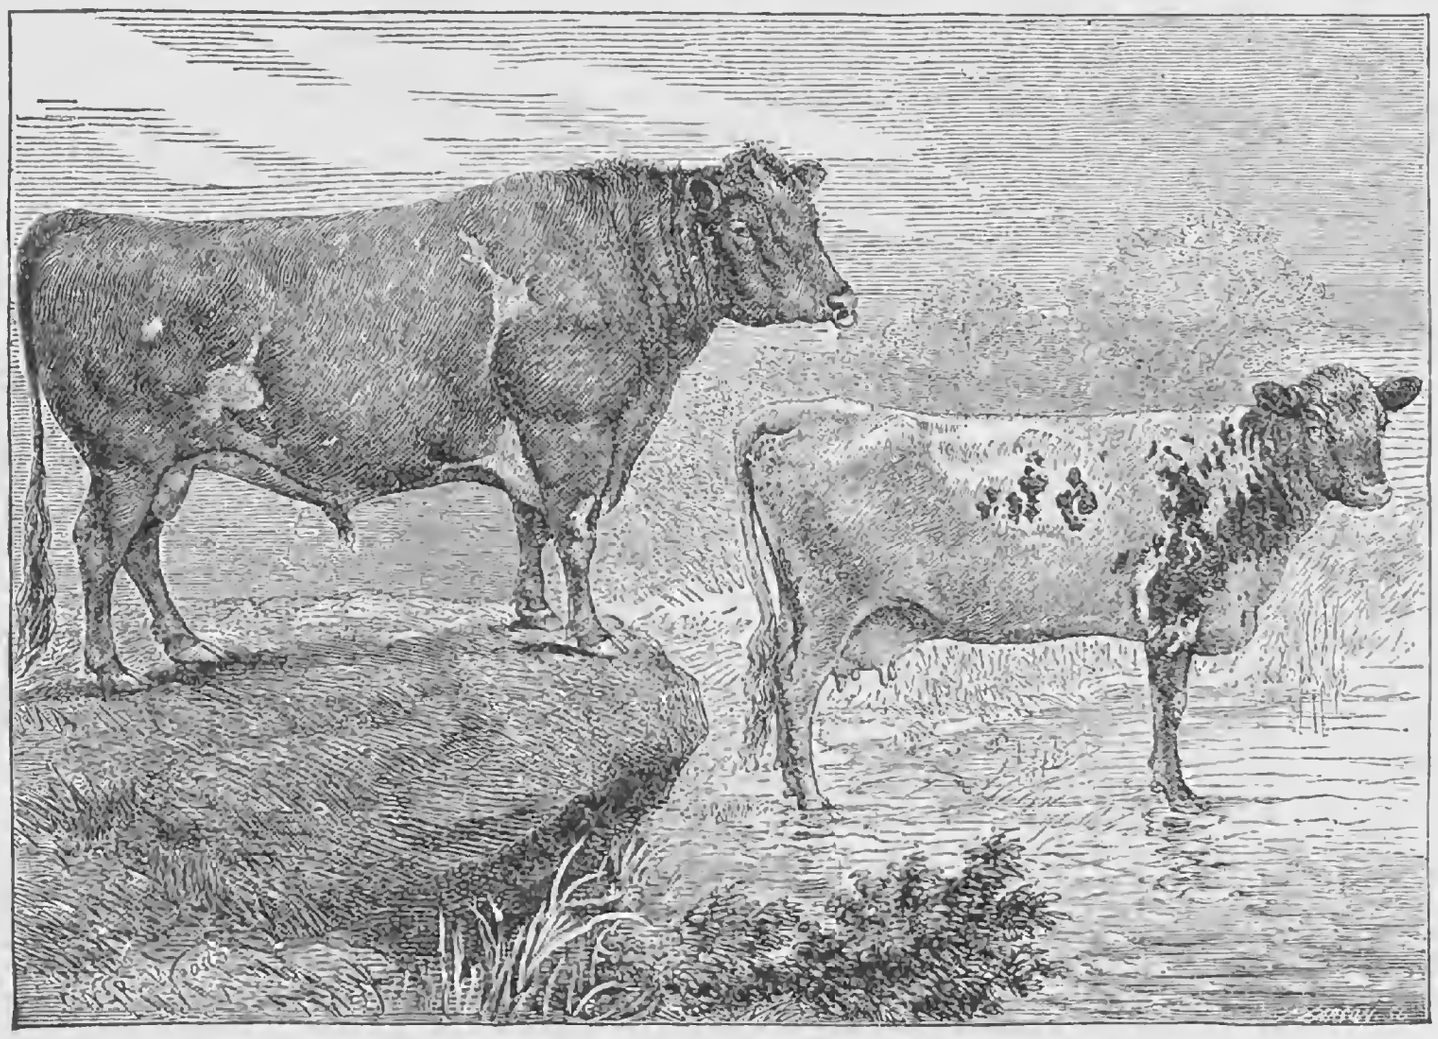
OUR ANIMAL PORTRAITS.

The Jamestown Breed of Cattle.

While America has produced several breeds of swine acknowledged everywhere to be of high excellence, she has hitherto been strangely backward in producing native breeds of other species of live stock. Among horses, although great attention has for years been paid to the breeding of trotters, it is still a question whether we have yet produced a distinct breed of roadsters, even if the Morgan horses are included under that head, while no attempt seems to have been made to form a native breed of other kinds. In sheep Mr. Scott, of Kentucky, is said, on good authority, to have formed a native breed, but hitherto little has become known to the general public of its merits or distinctive characteristics. In poultry, the Plymouth Rock is so excellent a specimen of what can be done in the production of native breeds, that a natural regret arises that so little has been done in that direction. In cattle, despite the paramount importance of obtaining prime stock for the dairy and the shambles, and notwithstanding the great care and skill employed by a multitude in the breeding of animals adapted to the needs and conditions of the country, the only native breed that has been produced is that known as the Jamestown, a couple of specimens of which are represented in the accompanying illustration.

The Jamestown, like the Galloway, Angus, Norfolk and Suffolk breeds, is polled or hornless, and originally sprang in Massachusetts from the cross of a pure-bred Jersey bull on an imported Norfolk cow. The sire was from Motley's Flora, a very famous Jersey cow, imported by the Massachusetts Society in 1851, and the dam was brought over from Ireland on the United States relief steamship Jamestown, on her return after conveying a cargo of provisions to the starving inhabitants during the famine of 1847. The progeny of this cross was the bull Jamestown, dropped, in 1854, and called after the vessel on which his mother came across—a remarkable sire that has given his name to the breed descended from him. From the first his progeny attracted a great deal of local attention, the females being deep and rich milkers, and the males hardy, thrifty and gentle, while, both sexes were generally polled, from whatever dams they were begotten. The family was kept up by crosses on Ayrshires and Jersey cows, the polled calves alone being retained, until it became numerous enough to perpetuate itself without further admixture of other blood. So rapidly did the Jamestowns increase in numbers, and so uniform in appearance and good qualities did they become, that in 1878 the Norfolk Agricultural Society (Mass.), recognized them as a separate class in its premium list. In that year the most noted of the bulls was St. Patrick, owned by A. W. Chcever, of Sheldonville, Mass., who has a fine herd of cows, mostly descendants of this excellent sire who is represented in our engraving. His companion is the cow "Susie," belonging to the same herd, and six years old at the time the photograph was taken from which the engraving has been made. She usually gave 14 to 16 quarts of milk a day at her best, and for months gave ten quarts a day right along.

Combining, as it does, the Jersey, Polled Norfolk, and Ayrshire blood, the new breed could not have a better ancestry for dairy purposes. For quality and quantity of butter the Jersey cannot well be surpassed, neither can the Ayrshire for cheese and milk for the market, while experience has shown that a cross of the former on the latter produces an exceptionally valuable cow for all purposes except beef-making. The Suffolk breed is descended from crosses of the Polled Scotch Galloways on the Norfolk Duns, famous in olden times for their deep milking qualities, which they have transmitted to their descendants, which are considered in England hardly inferior to any breed for the quantity of milk they yield.



SPECIMENS OF JAMESTOWN CATTLE.

RE-ENGRAEVD FROM PROF. SHELDON'S "DAIRY FARMING."—Fig. 29.

STOCK NOTES.

There is a great future for American breeders as soon as they cut loose from their present system and become what they are and must always be—American breeders. We don't want to raise *English* cattle and sheep here. We can do better. We can improve on them. We are now producing better beeves on the Colorado and Montana pastures than are found on the ordinary English pastures. But they are not English breeds. They are our true native stock, the Texan, to begin with, crossed by Kentucky-bred Short-horns, that have been acclimated and Americanized on our blue-grass pastures for many years and some since the days of the ancient "seventeens." And if we want to see a lustrous fleece that will compare with that of a modern English long-wool sheep, we can find it in the improved Kentucky sheep that has been bred for many years by Mr. Robert Scott. Let us give up the desire for "foreign airs" and be content with our "native graces." It is better to be original than an imitator, and always playing second fiddle; the more so when we can "take the rag" from the whole world combined, when we confine ourselves to our own special business.

THAT notable phrase of Horace Greeley "Go west, young man," is ridden to death. The most recent instance of this is some advice given quite gratuitously to young men to go to Montana and engage in raising horses, netting 50 per cent. on the $17,000 to be invested in the business, each year. Advice is cheap and the poorest man can afford to give away any quantity of it freely; but what costs nothing is often worth no more than its cost. It is so in this case. To keep sheep is easier than to keep cattle and these are more easily kept than horses; but it needs considerable skill and experience that *must* be paid for in some way before a man can become a successful shepherd. To succeed in taking care of a herd of brood mares, with a number of stallions, and to raise colts, one must be a practiced and experienced horseman. For a city paper to induce inexperienced young men to embark in an enterprise in which they can never hope to succeed, is a crime, and to tack such a scheme as this on the tail of Horace Greeley's well-meant and sound advice is an absurdity. Young men with $17,000 lying loose in their pockets can find plenty of good use for their money without scattering it over the plains of Montana in enterprises of which they know nothing at all.

Sheep Husbandry.

NOTES BY A STOCKMAN.

COMPLAINTS are now unusually prevalent in regard to losses among young sheep and lambs by obstinate diarrhea. On examination of the dead animals the intestines are found to be infested with hair worms in large quantities. It has been supposed that these and other parasites which affect sheep disastrously in other countries—the fluke especially being referred to—are not indigenous in this country and that we are therefore exempt from them and the diseases which result from their ravages. It is unfortunate that this idea should have prevailed, because it averts attention from the true cause of what are the most fatal diseases among sheep.

FOR some years past I have been closely observing the history of some of these parasites and am certain of their wide-spread existence among our native wild animals. The fluke is very common among hares and deer from Long Island to Western Minnesota; the hair worm is prevalent in every State west of the Missouri River, and not only affects sheep and lambs but rabbits and squirrels as well. Not long ago I examined a dead rabbit which I found upon my farm with no indication of the cause of death except extreme emaciation. On opening the animal its stomach and bowels were filled with the same kind of hair worms which I have several times taken from sheep and lambs in Michigan, Pennsylvania, New York and New Jersey.

SHEEP owners should be on the lookout for these hair worms. The indications of their presence are, profuse and stubborn diarrhea, emaciation, paleness of the visible membranes and whiteness of the skin, the appearance of the animal being such as would naturally suggest the common name of the malady, viz.: "the bloodless disease." The worms may be taken into the system by means of eggs adhering to grass or hay, and these eggs possess so much vitality that they may remain in a dormant condition upon hay for a long period. The eggs are discharged in the dung and become attached to the herbage, in all probability, and are thus transferred to the stomachs of other sheep. Older sheep are rarely troubled with them, being sufficiently vigorous to resist their effects; but lambs pasturing after old sheep, are frequently attacked; very rarely, however, when pasturing upon fresh grass where older sheep have not run.

KNOWING the nature of the trouble, remedies suggest themselves. To avoid pasturing lambs after old sheep; or the use of sheep manure upon grass lands; or the feeding to lambs of hay that has been cut after sheep have run over the grass, will generally secure immunity. The usual remedy common among shepherds is to mix one pound of salt with four ounces of finely pulverized copperas, and to give a heaped teaspoonful to each lamb before feeding in the morning. If any sheep of mine were affected, I would try an ounce of linseed oil with half a drachm (half a teaspoonful) of chloroform given on an empty stomach. I think it would be effective, but have not tried it.

IT is surprising that breeders will continue the attempts to reproduce English breeds in this country when they know our circumstances are entirely different. A writer on this subject says: "Many of the breeds of sheep and cattle of England have inhabited the localities where they are now found, from time immemorial, and if we are successful with them in this country, it must be in similar localities." This writer cannot know anything of what he professes to talk about. Where in the whole continent of America can a similar location to the South Downs of England be found; or the Cotswold Hills, or the Lincoln Meadows? The English climate is insular, moist, cool, nearly equable the year round, and productive of such grass as will never be produced in America, where the climate is continental, and therefore hot and dry in the Summer, cold in the Winter, remarkably rig-

orous and severe in its sudden and extreme changes and not suitable for the growth of perennial, succulent pastures.

The Merino will not thrive in England. It is the sheep of hot climates, and Central Europe with a climate similar to ours is peculiarly adapted for it. It originated in Africa and was brought to perfection in Spain. It thrives to perfection in America and the American Merino is at the very head of its race over the whole world. Where the Merino will thrive, the large, long-wool English sheep wilt and deteriorate. The wool loses the softness and silkiness which are encouraged by a cool, moist climate, and becomes dry and harsh; and the sudden change of weather is fatal to the constitution of the imported sheep, enfeebled by high breeding and feeding. Where, then, can we find similar locations and conditions to reproduce these sheep? We cannot do it, and may as well stop trying to force nature into artificial methods. Man can do a good deal, but he cannot change natural laws.

THE COMING SHEEP.

UNDER this head, the English Agricultural Gazette of December 13, takes the same ground that I did in the RURAL many months ago, and that is that the large, long-wool sheep are now rapidly being neglected for mutton sheep, because they produce coarse tallow in place of lean, tender, juicy meat, and the various Down sheep are rapidly supplying their place. "Take, for example," it says "the Leicester. Fifty years ago this breed might appropriately have been said to rule the roast. Now, except in a very few counties, and among a small minority of farmers, the Leicester has been superseded. The Cotswold sheep is said to be going out, even upon his own hills, and does not seem to be spreading rapidly in any other locality."

The Gazette then goes on to speak highly of the South Downs, adding—"Scarcely a breed was not improved by his touch, and for this reason alone, the South-Downs will always hold a high position in the history of British flocks."

But now comes the point which I have repeatedly told our American flock masters. If they wish to take precedence in the British market with a mutton sheep, they must breed a still larger variety of the Down class, and I pointed out the Oxford Down as the first to be sought after, and the Hampshire Down as second. The reason of this preference is that the generality of the English butchers prefer a large to a small animal, provided it is about as fine in all its points, and that the flesh is nearly equal. This is the case with the Oxford and Hampshire contrasted with the South Down, and for that reason the two former will prove the most popular and profitable sorts of mutton sheep for our flockmasters to breed, not only for the foreign, but also for the home market. But at the same time they should keep up and extend the South Down considerably, as the butchers have a class of customers who invariably prefer its mutton, and they are always willing to pay an extra price for it. This is also the same in England, and will probably ever be the case. Thus there is no danger of multiplying them too rapidly. A. B. ALLEN.

The Swine-Yard.

SALT FOR PIGS.

Preventives of Disease. Natural Instincts. Sanitary Laws.

COL. F. D. CURTIS.

IT is not a general practice with farmers to give salt to pigs, or to mix it in their food. Salt is no more injurious to a pig than to a person. The stomach of a pig and its digestive functions are more like those of a human being than are those of almost any other animal. A hungry pig would probably eat enough to injure itself if its food was strongly mixed with salt, just as a hungry man would be likely to eat too much of salted fish or meat.

Salt is used to make human food more palatable and seems necessary to supply the wastes to the system caused by the animal secretions. The instincts of horses and ruminating animals lead them to desire salt: hence in a wild state they seek for salt springs or "licks," where they may satisfy this natural craving, and in a domesticated condition it should always be accessible to them, and then they never will injure themselves by eating too much of it. Pigs do not seem to have this natural craving for salt to the same extent as other animals; but I have known them to eat it when given to them while in pasture, and also while confined in pens; and I have made it a practice to put salt where pigs could help themselves to it.

When pigs are fed cooked food of any kind, and especially vegetables, the food can be improved and made more palatable so that the appetite may not flag, by moderately salting it. The proportions of salt should be the same as for human food. Too little attention is usually given by farmers to the stomachs of pigs. They are expected to eat anything and everything, or perhaps to live a long time on only one kind of food. This want of attention is the cause of frequent diseases among pigs, chief of which are diarrhea and constipation. Regular feeding of salt in moderate quantity, and of sulphur, with an occasional feeding of charcoal (once a week) will serve to make a good appetite, promote digestion, and prevent disturbance of the bowels, which is more likely to occur without these precautions. The health and digestion of pigs would undoubtedly be promoted if they had access to prepared chalk, or if a small amount of magnesia was given them in their food.

Pigs suffer much from indigestion caused by over-eating, and if they had the remedies accessible, their instincts would teach them to make use of them, and thus prevent the frequent result — diarrhea. In Summer-time, when pigs have access to the ground, they cure themselves, or, in other words, prevent diseases of the stomach by eating grass which is laxative, or earth, rotton wood, or bits of charcoal which seem to check this condition, or to prevent extremes. The best medicine for any animal is preventive, hence their food and surroundings should be such as to promote health. The opposite is too frequently the case, as they are often kept in filth, and their food is prepared for them regardless of sanitary laws, their physical wants or natural instincts. This inconsistency is all the more remarkable when we consider that pigs are always reared only for human food, and are the most liable of almost all animals to possess parasites in their bodies, and are susceptible of a great variety of diseases, and among them those of a scrofulous nature, which may be transmitted to the human family when the pork is eaten. I never eat random pork, as I am afraid of it. When carefully raised and properly fattened, however, pig meat is healthful food. The omnivorous nature of pigs makes them more dangerous food than beef or mutton, as neat cattle or sheep will not naturally eat anything but grain or vegetables, while pigs are kept sometimes on putrid food, or the refuse of slaughter-houses. Cattle may be taught to subsist on fish, and be made to consume swill, but the number of such animals which are turned into beef in this country is extremely limited, while "swill" hogs are much more plentiful. A butcher, or any person who cuts up such animals, can readily distinguish them, as the flesh is soft and flabby. It should be made a misdemeanor to sell such meat, as it is not healthful food. Pigs from the country are almost always fattened on grain, and the firmer the flesh the nearer it is to perfection and health.

The Poultry Yard.

WINTER FEED FOR FOWLS.

"IT is well known that fowls are omnivorous and require, to keep in good condition, that they be fed a variety of provender. The three distinct articles needed are vegetables, meat and grain. In Summer, if allowed a reasonable range, insect life furnishes them with the meat class of food. Birds that do not migrate to climes where insects propagate themselves the year round, but remain where the weather becomes cold enough to destroy all active insect life, contrive to find the larvæ of the insects that remain in this form during the Winter. Fowls in confinement are debarred from this resource and must be furnished a flesh diet in some other form. A not very neat but still a successful method is to hang up the offal of hogs or beeves for them to peck at. If the weather is warm, this is apt to decay and produce a not very pleasant odor, and should it become too rank such food will injure the edible quality of the eggs laid by the hens fed on it or the flesh of fowls intended for market. The haslets of hogs—the heart, liver and lungs joined together—may be procured in most markets for a mere trifle. These, chopped up fine and about five of them fed during the week to a flock of 100 fowls, will answer admirably. I have tried chopping them with a hatchet and with a cleaver, but find the best and most expeditious way is to use a sharp butcher's knife, with which the stuff should be cut nearly as fine as grains of corn.

Another good meat diet is what in these parts is known as "scraps" and at the West and South as "cracklings." It is the refuse of lard-rendering establishments, and is pressed into cakes of the shape of flat cheeses, weighing 5½ pounds. It is sold at three cents a pound and forms a very rich, egg-producing food. It is so firmly pressed together and it requires so much labor on the part of a chicken to get off a piece that it is a good plan to place the cake within reach of the flock and allow them to help themselves, as there is but little danger of their eating too much. If, however, it is thought better to feed it, then it should be fed mixed with bran—a pound and a half a day to 100 hens.

The meat scraps from the table should, as far as possible, be utilized, the bones constituting the best part if properly prepared. To do this take a hatchet or ax and mash them fine enough for the hens to swallow. The bones of all fowls are hollow and therefore easily mashed, while hens are exceedingly fond of them, as they are of fish bones and fins, and one need not fear their becoming choked on them. What a hen cannot swallow she can easily scratch out of her mouth, while every one knows what sharp pieces of stone and even glass she will take down without wincing.

A certain amount of fresh vegetable food should be given every day, and it matters very little what variety is chosen. Some they refuse in the raw state, as potatoes, while they will eat them ravenously if cooked and slightly salted. Others, as cabbage and turnips, are probably best fed raw, being hung up where the hens can peck at them. The exercise while in confinement is good for them and seems to amuse them. A hundred hens should have two fair-sized heads of cabbage a day, or their equivalent in other vegetables. If roots are fed, there is no need of cutting them very fine, as a little work for the hens at this season is good for them. As fowls are not very choice in their selection of vegetables, it is best to feed those kinds of which the greatest bulk can be procured for the least money, and here I would suggest pumpkins as probably the cheapest hen diet that can be procured. In the Fall small pumpkins, only fit for stock feeding, can be had for little more than the cost of hauling, while chickens are very fond of them. The only drawback is the necessity of storing them where they will remain in an atmosphere constantly above the freezing point and not too dry, or they will shrivel up. It might be here remarked that when the ensilage fever is over, the silos can be used for this purpose. Ensilage itself may make good chicken food. Has any one tried it?

The choice of grain food may also range over a large number of varieties. Among those kinds that are most popular for feeding, are wheat, barley, oats and corn, with buckwheat a high favorite when it can be procured. But here, again, the largest bulk for the least amount of money should be held in view, and this rule is almost certain to point the choice to corn. I am not altogether certain that this is not decidedly the best feed for Winter, as it is rich in oil and is a heat-producing food. I am not an advocate of cooking grain of any kind in Winter, believing it to do better in the hard state. A flock of 100 hens will consume about 20 quarts of corn a day, besides the regular warm feed in the morning, in very cold weather when their whole attention is given to the feed box. Along with the corn should be given a supply of broken oyster shells. These answer a double purpose—they grind the food so long as the edges are sharp enough, and the parts that wear away are utilized in making bone and egg-shell. Restaurants at this time are only too glad to furnish these shells to anyone who will cart them away.

The books all tell us that the first feed in the morning should be a warm mash. Now let us see. In order to have this feed ready and warm when day-light first appears—when the fowls leave the roosts—one must either stay up all night, or, what is worse, get up an hour or two before day-light. Neither of these plans will be followed by one in a hundred of those who breed fowls. I find the most practical plan to be to leave some corn within their reach when the hens first leave the roost; and after breakfast, or about eleven o'clock, I mix the warm feed consisting of bran, potato peelings, and other scraps, or if these are not to be had, then whole vegetables of some kind boiled until soft enough to squeeze with the bran between the fingers, and with this I put all the pot-liquors I can get; also a good supply of red pepper water and sufficient salt to give the whole a relish. I keep constantly on hand for this purpose a large stone jar filled with water and red peppers. When this warm feed is prepared I roust out all the hens, whether in nests or sunning themselves or otherwise engaged; put them all together and see that one gets as nearly as possible as much as another. This is necessary; for this feed is never fed in such an abundance that any will be left. It is a sort of "constitutional" and should go round evenly. The main feed is corn, and the most successful managers I have seen keep this before the fowls all the time. I have no doubt it would be better to feed only just enough so that all of it should be eaten up clean; but, like many other good theories, this will not work in practice. No man has hens enough to pay him for standing and feeding them all day, and if he does not do this, or keep a supply within their reach, they are sure to suffer at some time from neglect, for the simple reason that often more important interests will command the owner's time and attention. The above system of feeding is with a view to making the hens lay eggs in Winter when extra care is necessary if they are expected to do any thing more than barely exist until warm weather comes again. L. S. H.

FANCY FOWLS.

IT seems very strange that the occupation of raising fancy fowls should be of sufficient importance to support numerous weekly and monthly journals devoted exclusively to that industry, and yet so few can make the raising of common poultry pay. Is it that the fancy breeds are so much better in every way? Or is this a little private enjoyment that men indulge in, like driving fast horses or sailing yachts, without the least regard to the cost of the matter? So far as mere feather is concerned I am sure this is the case. In relation to flesh and eggs, there is something of an open question. But even here, I have great faith in feed and proper management with the common fowl to bring about the best results. While it is true that the French have produced excellent breeds of fowls for the table, it is equally true that no man ever ate a perfect broiler outside of Paris, and the chickens of France from which the large stock that supplies the common market is drawn, are no better or more specially bred than are our American fowls. The foreign breeds have been in this country so long that it is now hard to find the old barnyard fowl in his simplicity. He invariably struts about with some kind of foreign toggery about him—a drooping comb that he borrows from his half-bred Leghorn mother, or feathers on his legs *a l'* Asiatic. Perhaps he has a Polish crest upon his head, but certain it is he has enough foreign blood in his veins to turn him to a good account for the table if he is properly fed. So it is with the hens—they have inherited more or less of the everlasting laying qualities of the Mediterranean breeds, and if properly housed and cared for will give a remunerative return in excellent eggs POULTRYMAN.

Dairy Husbandry.

THE DAIRY COW—NO. 22.

HENRY STEWART.

Working and Packing Butter.

IT used to be considered that butter required to be worked over, cut, squeezed, and pressed; worked even with the hands at one time, almost in the manner in which a brickmaker works his clay to fit it for the mold and make it tough and plastic; or, more recently, with butter workers which have almost the same effect. Working butter, if it is at all necessary, is a necessary evil; because it is an injurious operation required to avoid the more injurious presence of easily decomposed impurity (milk) in the butter. But there is no necessity for working butter at all. When it is made so as to come out of the churn in small grains, it may be washed perfectly free from the buttermilk with the greatest ease, and the salt may be mixed in with it in the most even and intimate manner, without disturbing the texture in the least by the slightest degree of working. At figure 30, is a representation of a small quantity of butter lifted out of the churn at the moment when the buttermilk had been drawn off. The mass is composed of small granules, most of which are no larger than cabbage seed; and the remainder of the size of grains of wheat. Some of this butter washed in three waters was packed in brine in glass jars for customers who wished it in this condition. The brine is perfectly clean and the butter taken from it is put upon the table in an elegant and convenient form for use, and as sweet and fresh as when taken from the churn. In domestic dairies there can be no more delicious butter—to some tastes—than when it is so made. If salt is required, that can be added to suit the taste, when it is consumed. When packed in this manner, butter will keep for years.

It is a mistake to suppose that washing butter injures the flavor. It cannot. Butter is an oil or fat, totally insoluble in water, and all its flavors are component parts of the fat, which cannot possibly be separated from it by contact with water. In washing granular butter it is necessary to use cold water which sets or hardens the granular atoms and prevents them from combining in a mass. When butter is taken from the churn in masses, the water should not be so cold as to harden these, otherwise the milk cannot be removed easily, and then the butter will not keep for any length of time, in spite of all precautions. In such a case the butter placed in the bowl is to be worked down with the ladle in thin slices, so as to provide outlets for the buttermilk to escape. The milk which escapes and flows to the bottom of the bowl should be poured off, and the butter washed with clear, pure water; the butter is then turned in the bowl and sliced in the opposite direction and again washed, and if the work has been skillfully done, this

is all the working that is necessary. A marble slab is an excellent thing to work the butter on. A thick plank, or block of hard maple or beech, not less than twelve inches square and four inches thick, placed upon folded towels or in a large pan to collect any moisture that may escape, is convenient. There are several convenient butter-workers made for use in dairies, all of which serve their purpose very well, and between which there is not much to choose. The main point to be observed in working butter is to avoid *plastering* it with the implement used, whether it be the hand, the ladle, or a lever, or a rotary crusher. The butter may be squeezed with impunity, to a considerable extent, but if it is plastered or the impiement is drawn over it with a sliding motion, it is seriously damaged and the texture destroyed.

Butter is salted as a means of preservation. Some persons prefer it unsalted when it can be procured fresh. In this condition are preserved all the most delicate flavors which are lost when salt is added. In the domestic dairy, butter may be sent to the table in this way or even direct from the churn without washing, and with all its native buttermilk adhering, as an unusal delicacy. But for ordinary purposes about six per cent. of salt is added to the butter; this is equal to one ounce to the pound. The salt is sprinkled evenly over the butter at the last of the working when it is sliced or gashed. The butter is then loosely gathered together and it is set away in the dairy for 24 hours. During this time some milky water usually escapes from it, and this is poured off at the final working. This is done in the same manner as before, and is continued until any streakiness in the butter is removed, and the whole is brought to an even and regular color and consistence. Some persons color their butter when working it, but this is not to be advised, for the color cannot be made even, and the butter will be streaky and patchy in spite of the most prolonged and injurious mixing. Some frightful examples of such butter are often seen at rural hotels and railroad restaurants. Coloring should always be done in the churn by mixing the proper quantity of prepared color in with the cream. The usual quantity is one teaspoonful to three gallons of cream. This is sufficient with the best Jersey and Ayrshire cream; but each dairyman should test this matter for himself, as the natural color of the cream varies with the cows, the feed and the manner of keeping the milk and cream.

The salt used is of greater importance than might easily be considered. The usual impurities of salt are chloride and sulphate of lime and chloride and sulphate of magnesia. Lime mixed with fats combines and forms an insoluble white soap. When lime is present in salt, small, white specks of soapy substance, are formed in the butter, thus injuring its keeping qualites. Magnesia is bitter, and if this is present the flavor is injured, so that it is of the greatest importance to have the purest salt. Unfortunately, our American salt is not of sufficient purity or uniformity for dairy purposes, and the best qualities only of English salt should be used. Of these there are two kinds on the market, known as the Ashton, and Higgin's Eureka. The latter is fast superseding the former on account of its perfect, purity, uniformity of grain and freedom from objectionable scale. As the difference in price between good and bad salt is very small and the difference between good and bad butter is very large, the extra cost of a sack of the best salt may easily be saved upon one pail of butter. A hundred pounds of salt will pack 1,600 pounds of butter, and two to five cents a pound on this quantity may easily be lost by means of bad salt, making a loss of $30 to $80 to offset the gain of one dollar, or less.

LARGE YIELDS OF DAIRY COWS.

L. S. HARDIN.

It is a good sign of the times to see men who own extra-good cows bringing before the public systematic statements of their yields, not only for a few days in flush times, but a continuous record from calf to calf. Just now the dairy world is startled with the records of two cows that seem so far to surpass other cows that the race to the hindmost appears hopeless. In the business of dairying a cow that yields 350 pounds of butter a year is considered a superlatively good one. She stands at the head of the herd, and it is generally considered that men who follow a calling for a livelihood know best how to manage it. Here at least it has always been thought that experience was valuable; but the records, so far as at present made up, say no. Two men who follow callings totally distinct from dairying, have carried the art of butter production practically beyond all competition. The owners of Eurotas and Belle of Scituate are in no sense dairymen, though one at least owns a small herd of dairy cows. They come upon the stage comparatively strangers and produce yields that startle the community. Jersey Belle of Scituate made 705 pounds of butter in a year, while Eurotas followed with a total yield of 778 pounds.

As already stated in the RURAL of December 11, '80, this remarkable yield of butter is from 7,525 pounds of milk, or about nine and a half pounds of milk to the pound of butter. The best work I ever witnessed with the milk of native cattle was in the Chautauqua trials between so-called deep-setting and shallow pans, at a high temperature. With the milk of native cows in Summer, each method required 21½ pounds of milk to one pound of butter. In the trials between Mr. Eastburn Reeder, of Pennsylvania, and myself, with the milk of Jersey and Guernsey cows, I reduced the yield to 17 pounds of milk with deep cans, and Mr. Reeder to 19 with his half-shallow pans. The above trials were with the mixed milk of herds; but though each one of the above Jerseys had been often tested singly, so far as cream yield was concerned, there had never been found any great variation in the quality of the milk from single cows. I remember once a most reliable gentleman told me his imported Jersey cow had made a pound of butter from 10 pounds of milk. We lived near each other, and he wanted me to verify the statement. On investigation I found all hands were laboring under a mistake. The cow was approaching parturition, and the whole milk, after standing a while, seemed to settle into a thick mass like yellow cream-cheese, and a little stirring separated the water from the curd, leaving an article not merchantable as butter.

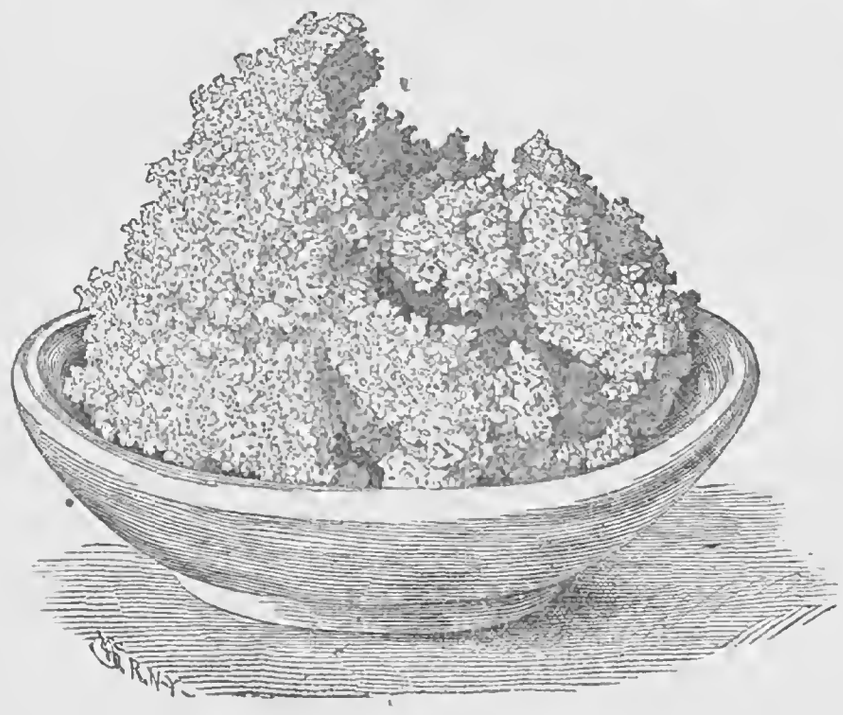


FIGURE 30.

I have often heard men claim to have owned cows that yielded almost pure butter. It is a common occurrence to find little soft pellets, like the cream that first comes in churning, on the sides of the pail while milking. Some cows may yield this article, whatever it is, to just about the consistency of butter that may fairly be worked into a merchantable article. It is thus only that I can account for a continuous yield of one pound of butter from nine and a half pounds of milk, and yet the science of testing cows is so decidedly in its infancy that it may be presumption on my part to question what at present appears phenomenal.

We have seen the speed of trotting horses increased, lowering the record to "two-forty," without pedigrees. After that the science of breeding took a hand, and, step by step, in the course of long years and after great effort and long-continued experiments in certain lines of breeding, we have seen Maud S. cut the record down lower than any of her predecessors. This was done, not at one swoop, but horse after horse lowered the record second by second, until Maud S.'s great achievement outdid all former efforts, though probably not all future ones. Now, if we group the horses by their present performances we find them growing more numerous at almost every second as we recede from the best record. With cows, so far as we know, the butter yields of the above "queens of the pail" stand nearly 100 per cent. above those of all rivals. To be sure, there are some old records giving a gross yield of some 400 pounds a year, but the above are the only continuous records; and Eurotas I believe is the only cow that has ever made so much butter from so little milk during the flood of her yield. All of these suggestive doubts may be owing only to the absence of a greater number of records. The whole matter of testing yields is only in its infancy, and we are in comparative ignorance of what many of our cows are doing every day, and after the keeping of accounts becomes a more common practice we may discover many yields that approach to these.

It will be noted from the record given in the RURAL of December 11th last, that this test of Eurotas was wisely begun in the Fall, giving her the advantage of a maternal stimulus during the Winter and the revival of her flow when she came on green grass in Summer; yet, as before stated, the yield of milk is not remarkable. Herds of Holsteins and natives have equaled it time and again, while the food she consumed could not have altered the ordinary Jersey yield from, say, 17 pounds to 9½ for one of butter. This must be an idiosyncrasy of the cow herself, and it may be one well worth preserving, for this quality of turning a small amount of milk into a large quantity of butter need not have the exhausting effect of yielding a heavy flow of milk, like Col. Hoffman's Holstein that gave over 16,000 pounds in a year.

Eurotas seems to have strangely varied her yield during the year, in December nearly doubling the yield of November, while in February, March and April she fell below her yield in January. Then again, in September she gave 454½ pounds and only 123½ in October. This may have been owing to the quality of feed, as she may have required certain elements to form her peculiar yield; for, in the absence of further explanation, we must call this not only a wonderful, but an exceedingly peculiar yield. I would like very much to see an analysis of her milk compared with that of her stall companion, to discover, if possible, in what consists this great yield of butter. It might be that science would point out in her milk some peculiarity that could be discerned in other cows, and thus a new breed be started with a butter tendency that would leave even the best Jersey as far behind as Eurotas now does the average Jersey. Her owner, Mr. Darling, is wealthy and enterprising, and I hope he will have his cow's milk analyzed to facilitate the discovery or formation of a new breed. I see no reason why the new butter-yielding capacity could not be combined, at least to a large degree, with the capacity for deep milking, as I think it often has been in the case of the native cow where both qualities have been bred for. Then, if the progeny of Eurotas and the Hoffman cows could be so crossed as to produce an offspring capable of giving the milk yield of the latter and the butter yield of the former, what a wonder we would have—something like 1,700 pounds of butter a year from one cow.

The plain, practical dairymen, with their years of hard experience, cannot be blamed for some lack of confidence in these remarkable yields, and it is therefore all the greater pity that we have not some accepted method of public trial that would enlist general confidence to the extent of setting these large yields up as standards for others to work to; but instead of agreeing upon some simple and inexpensive method of testing and recording these yields, the sole use they are put to is to make them the excuse for writing flaring articles in praise of some gentleman's herd containing the blood of the famous cows so lauded, and then in a month or two the sequel follows in a flaming advertisement of a public sale of this gentleman's herd, as though he had labored all his life and spent all his money to the end that any one who chooses to become a purchaser may profit by his labor and pecuniary sacrifices. There has been such a commingling of large records and big auction sales of late, coupling sensational prices with animals of ordinary capacity, that a slight film of incredulity causes one to wonder how far one is to be dependent upon the other.

It would be a good thing if our State Boards of Agriculture would take this subject of testing cows under consideration, and see if testers could not be chosen with skill enough to correctly measure a cow's capacity; honesty enough to give her the full measure of her performance, and independence enough to tell exactly what she does, without fear of harm or hope of reward. The need of some trustworthy method of testing the yield of milk of dairy cows, as well as the butter and cheese products from that milk, is acknowledged on all hands; but so long as the establishment of such a method is left to private enterprise few farmers will avail themselves of it, as its employment must entail some expense.

Farm Economy.

COOKING, TING AND GRINDING FOD DER AND GRAIN.

S. B. PECK.

It never seemed to me good economy to cut straw, hay or corn fodder for horses or cattle, for the finer the fodder is made the less it will be masticated, the less gastric juice will be mixed with it, and the less nutriment extracted. Neither do I think there is any possible advantage in forcing this fodder down the animal's throat by mixing with it the more palatable ground grain. Both the horse and the ox need something more bulky than grain, and if there is anything before them in the stall, even though it be nothing more palatable than poor straw or the leafless stalks of corn, they will, after eating their grain, eat of this coarse fodder till their wants are satisfied.

From 1845 to 1860 I lived in a community of farmers, and I noticed, as I visited their barns and sheds, that every one had a cutting-box set away in some out-of-the-way place, but I scarcely ever saw one in use. They had been highly recommended in the papers and all had bought them, but soon got tired of, or out of conceit with, them. During that time there came out in the papers an analysis of the corn-cob, showing that it contained considerable nutriment, and there were statements of experiments with feeding corn and-cob meal, showing a great benefit from the cob. Well, "it took," and our miller gave verbal notice that he would get up a corn and-cob grinder, and that he was having a sign painted to put on his mill, "*Corn in the h'ear ground 'ere.*" The sign was put up, all translated into plain Yankee language, and everybody (minus your humble servant) took corn in the ear to be ground. Soon my nearest neighbor asked me to look at his old horse, Billy. Well, Billy did look sorry and ashamed of himself, and I soon learned that what I suspected was true—the old horse had been cheated with corn-and-cob meal, and I said to my friend, "I have no doubt that what you have read about the nutriment in cobs is true, and the same thing is true of sawdust, but the question for you is, can your twenty-year-old horse extract this nutriment out of such a mass of rubbish? Give your corn-and-cob meal to your chickens, they will show 'which is which,' and give Billy honest food." Billy was soon cured. It was always a question with me whether any quadruped could take into its stomach with impunity the sharp, cutting edges of a broken corn-cob.

There have lately appeared in our markets hand-bills highly recommending cooked feed for horses and cattle, and offering to sell it for *only* ten cents per hundredweight over the price of raw. My neighbor tried it, and was pleased. I asked him if he knew how much water there was in it. "Oh, it is perfectly dry," he replied. I said, "So is your bread dry, but chemists say there is 45 per cent. of water in it." The question with me is not so much whether it is better for the feeding as whether one gets as much nutriment for the money in the cooked as in the raw. If wheat flour takes up 45 per cent. of water in the process of bread-making, it is quite likely that ground corn and oats will take up some water in cooking, and probably enough to pay the expense.

Those who have paid no attention to chemistry can hardly understand that water in plants, vegetables, and in many other substances is not necessarily liquid, or even wet to the touch. Gypsum in the stone is as dry as any other stone, but when subjected to heat in the process of making stucco, about 22 per cent. is driven off in steam or vapor. Limestone, after being subjected to heat and its carbon driven off, takes readily over 30 per cent. of water in slaking, and is still dry. The potato and other cultivated roots, with all our fruits and even animal flesh, are said to contain from 70 to 95 per cent. of water combined with their other constituents, the combination of which forms a solid.

THE ICE TRADE OF THE ST. LAWRENCE RIVER.

The ice trade of the St. Lawrence River has, within the last few years, grown to almost fabulous proportions. This river is really one of the finest ice-fields in the world. No other river has water so pure that makes ice of such fine quality. While the Hudson between Albany and New York may present a scene of greater activity while the season lasts, yet the season for harvesting ice is much longer upon the St. Lawrence and the ice is of a superior quality, making it desirable for shipping to Southern points. Dealers in ice all along the St. Lawrence never resort to any place but that river for their supply, and in later years quite an extensive jobbing trade has sprung up in shipping ice to the lake ports. In securing a good crop it is very often necessary to let the ice break up at least once, and perhaps oftener, in order to

secure perfect quality. The cause of a poor one is the great quantity of floating or anchor ice that lodges in the coves or bays, the places where ice-fields are usually staked out, and this floating article forms ice deficient in solidity. After a break-up, the ice formed in two or three days' freezing is of superior quality. During very cold weather the ice forms from two to three feet in thickness, and is very transparent.

The *modus operandi* of harvesting ice has been reduced to a science. In former times a single farmer when he wanted to fill his ice house, would cut his ice with a cross-cut saw, and the task was slow and unpleasant. Accidents sometimes happened, both dangerous and disagreeable, as, for instance, in the case of the man who found it easier to work where he stood, on the block he was cutting, and sawed it entirely off, happily with no worse result than a cold bath. But a single farmer never can make the elaborate preparations for harvesting ice made by men with whom it is a business. It is slow and laborious cutting ice by hand and handling it without proper tackle. Where men make a business of dealing in it the principal part of the cutting is done by horse-power, and very rapidly, by means of an ice plow. The ice-field is plowed its entire length in strips of a suitable width, by horse-power. The strips are cut in suitable blocks by large hand-saws, and floated to a particular point for loading. For convenience this is usually done at a point farther down stream than that where the ice was cut. At this point, by means of a long slide with one end in the water and the other high enough to drop the ice on the sleighs, smart men with pikes can load a team in a very few minutes. Care in cutting, that is, to have all the blocks of equal size and square in shape, greatly facilitates the packing of the ice. It is very often advisable, if time and opportunity allow, to dress the blocks with an axe where they are of awkward shape. In all the towns of any considerable size on the banks of the St. Lawrence there are men who make a business of dealing in ice, either for the local market or as jobbers engaged in shipping it, and when these men with their improved facilities for cutting and loading commence their ice harvest, farmers who wish to secure their year's supply, can usually purchase it already loaded on their sleighs, for forty or fifty cents per cord, a much lower figure than that for which each farmer could cut the few cords he would require.

A good team will usually draw at least half a cord at a load, and if the farmer is at all ingenious in making arrangements for unloading, the task of securing the year's supply becomes comparatively easy. It is always possible to slide the ice from the sleigh to wherever it is wanted by means of plank, and ice can be handled very easily in this manner by using long hooks made of good bar-iron. A great many erroneous ideas are entertained in regard to storing and keeping ice. Nearly all men with whom I have any acquaintance, invariably lost their first year's stock of ice owing to their neglect of proper ventilation. Others, again, think it necessary to provide an expensive building for keeping the commodity, while others omit to provide suitable drainage. Let it once be thoroughly understood that the cheapest building possible is good enough if there are only sufficient drainage and ventilation, and the job of storing ice will not appear nearly so formidable as it now does. Ten dollars are quite sufficient to erect a building good enough for any farmer. The trade in ice is already an important industry; a large capital is employed in it and it furnishes employment to a great number of men and teams. The season of 1881, commencing about the first of January, bids fair to be a prosperous one, as the ice is of excellent quality.

F. K. MORELAND.

Farm Topics.

SEASONABLE HINTS.

WHILE a relaxation from pressing work may be found now, such as can be found at no other season, there is much that may and should be done by all who desire to practice system and economy in farm management. With the coming of the new year we are reminded that a new campaign of seeding, cultivation and harvesting is drawing near, and it is often not without a certain feeling of dread that we contemplate its approach, and we are not disposed generally to spend much time in reviewing the one just closed. Still I think a few hours may profitably be spent in retrospect. If a daily or weekly record is kept, let an evening or two be spent in reading it over and refreshing the memory with the details of the struggles and triumphs of the past year. If no written record is kept, let the family talk it over and call up the principal incidents, each member contributing his or her share to the history of the year. This will assist in utilizing the experience of the past which should be to us all a part of our "stock in trade." Then let some time be devoted to taking an "account of stock"—an inventory of farm live stock, tools, fixtures, grain on hand, etc., and their values should be tabulated. If we are out of debt the result will show our resources, or, in other words, how much we are worth. This inventory, revised each year and compared with those for the previous years, will show whether we are gaining or losing, and how much.

An accurate account of all expenses should be kept, and if this has been done for the past year an estimate may be made for the coming year. This should include the amounts needed for the purchase of new tools and for repairs upon old ones. It should also be decided what improvements, if any, are to be made and what is to be their character and cost. A plan of farm operations should be marked out, and, with the experience of past years before us, we can usually see where improvements can be made. If our financial exhibit of the past year proves unsatisfactory, we must try and ascertain the cause, and endeavor as far as possible to correct it. If there has been careless or unwise management or if petty leaks have occurred here and there, the former must be amended and the latter be stopped. If the fault is in the season, if frosts, floods, or drought have baffled us and cheated us of the rewards we have justly earned and expected, all we can do is, like a disappointed fisherman, to hopefully try again. It will be found advisable to anticipate the coming busy season and study how we can make a day now count for one in seed-time or harvest.

We may do this by putting tools in order, rigging hay forks, repairing fences, trimming orchards and hedges, etc., etc. It is a part of good farming to have things convenient around barns and stables, so that teams and stock may be watered, fed and cared for with the greatest economy of time and labor. The farmer no less than the merchant or banker, to achieve the greatest success, must devote his whole time and talent to his business. He must in Winter live, so to speak, with his stock; in Summer, with his crops. He must study not only to make the most of fair weather and propitious seasons; but prepare for accidents and failure also, and strive to reap some benefit even from adversity. He should as far as possible, make the elements his servants and make the winds, the sunshine and the rain all contribute to his success; but, ever keeping in mind their treachery and variableness, he should obey the old injunction "never trust the weather." Thus while we sit by the fireside with the temperature at zero, if our land has been well drained or fall-plowed, we can take comfort in the thought that the frost is doing for us now what no effort of ours could do in Spring in mellowing and loosening the soil. If the winds sweep uncomfortably, they should pump our water, grind our grain and do many other jobs for us through the instrumentality of a good windmill. If crops have been short over a considerable extent of country, we should know this fact, and if possible profit by it. If our dairy products are a drug in market in Summer, we should let the cows go dry through the season of heat and flies, and milk them in Winter, and if rings and corporations combine to fleece us, we must combine also, and turning what seems our greatest obstacle—our numbers—to our advantage by the ballot, enforce justice and respect.

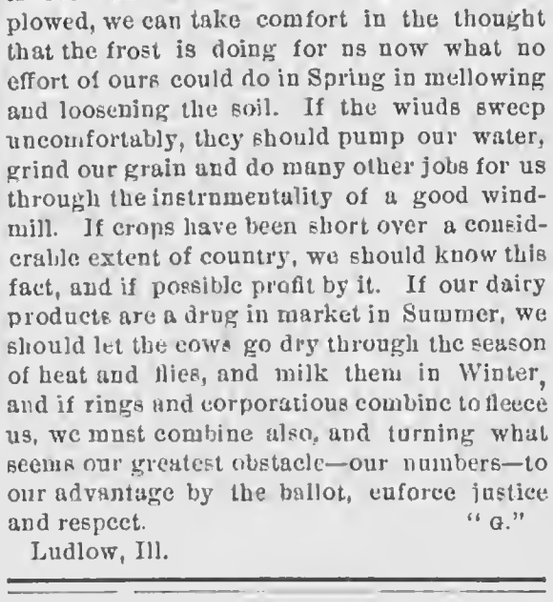
Floricultural.

SOME NEW PLANTS OFFERED BY GERMAN FLORISTS.

AMONG the new plants which may minister to the delight of all lovers of flowers next



MEGARRHIZA CALIFORNICA.—FIG. 31.

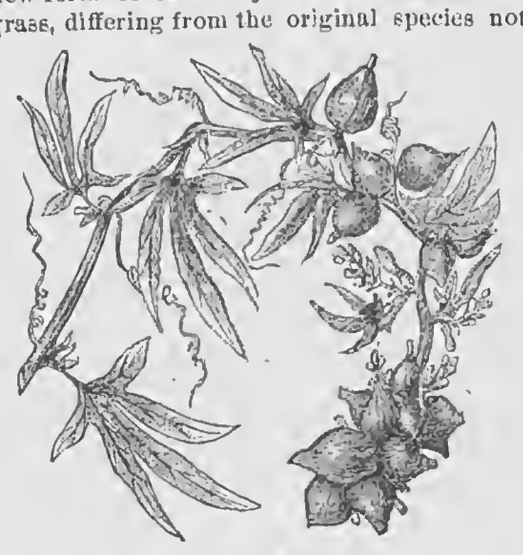
Summer, we take occasion to notice the following:

MEGARRHIZA CALIFORNICA, Fig. 31, is a new and very rapid-growing member of the Cucurbitaceæ family, of the same elegant habit and handsome appearance as Pilogyne suavis, but of much larger dimensions, the stems often attaining a length of 20 to 30 feet in one season. The beautiful, glossy, silvery leaves, about three to six inches in diameter, bear short, scattered hairs, the small, white sterile flowers appearing in slender racemes, while the fertile ones grow singly and are somewhat bigger; the oblong-shaped fruits, about

BROMUS PATULUS NANUS.—FIG 32.

two inches long, are densely covered with stout, pungent spines similar to those of the Cucurbitaceæ introduced up to the present time, being of about the same size and form as a Broad Bean and germinating as easily and surely as pumpkin seeds. The plant becomes fully developed when grown as an annual, but it can also be cultivated as a perennial, as it produces long and large tuberous roots.

BROMUS PATULUS NANUS, Fig. 32, is quite a new form of this very valuable ornamental grass, differing from the original species not



RHYNCHOCARPA GLOMERATA.—FIG. 33.

only in its lower growth, being scarcely half as high, but far more in its much more graceful, thinner and shorter panicles. By comparing a panicle of Br. patulus to the one shown in natural size in the figure, the superiority of the above-named sort may easily be noticed. This variety has already been cultivated for several years and has proved perfectly true from seed. It represents a valuable addition to the assortment of ornamental grasses grown on an extensive scale for bleaching purposes or dry grass bouquets.

RHYNCHOCARPA GLOMERATA, Fig. 33, is a charming and interesting climbing member

BEGONIA DAVISII.—FIG. 34.

of the same family, from Brazil, growing 12 to 15 feet in hight. Its branching habit and thickly-set, abundant foliage make it specially well adapted for covering arbors and fences or for garnishing festoons. The whitish flowers, as is mostly the case in this tribe of plants, are not very conspicuous, but the deeply cut, five-lobed leaves, together with the numerous hazelnut-like fruits appearing in dense clusters, render this plant one of the most attractive climbers for out-door culture. To judge by the tuberous-like root it may be treated as a perennial, but it succeeds well in any warm border as an annual.

BEGONIA DAVISII, Fig. 34, is a beautiful free-flowering new tuberous-rooted species of dwarf habit. The flowers are of the brightest scarlet imaginable, standing well out of the foliage as the above figure shows plainly. Undoubtedly it is one of the finest introductions amongst the tuberous-rooted class.

PARLOR GRASSES.

THE beauty which is all around us we neglect, while for that which is foreign we will pay the highest prices. I claim that our own grasses are quite as beautiful as most of the exotics. They are, at least, more suggestive. The sight of them leads us in imagination to pleasant river banks, to flowery meadows, or perhaps to mountain tops whence we viewed the kingdoms of the earth. We begin to gather grasses and sedges in Spring, and keep it up through the Summer, as the different species succeed each other, until at last we are prepared to arrange them.

With the grasses one can combine the delicate inflorescence of the Sea-lavender (Statice Limonium) the pearly heads of Immortelle (Antennaria margaritacea), a few bleached ferns, and a few that retain the glory of the setting sun. Then an exquisite addition is Cotton-sedge (Eriophorum). Its downy tufts are, like the breasts of the Birds of Paradise, of changeable, silk-like sheen.

An extremely beautiful grass is the Glyceria Canadensis which has open, drooping panicles of straw-yellow spikelets. There are as many colors in our grasses as there are hues in the forest, delicate greens, purples, and maroons. The habits are as various as the colors, from the upright spike of the sea-side Calamagrostis to the gauze-like film of Sporobolus. The more one studies grasses the more entranced he becomes, for the beauty is not alone in the growth, but the minute blossoms are pretty beyond description. I commend both grasses and sedges to those who love the woods; although their study is hard, they reward one by many an undreamed-of wonder. We marvel indeed, more at the elegance of little things, than at the vastness and magnificence of the great. The striations on a diatom, or the stigmatic feathers of a grass are as wonderful in their way as the craters of the moon. The difference is in degree not quality. Nature neglects no detail even in her hidden architecture. We find everywhere and always a directing hand. An opening rose-bud is a wonder, but so also is a budding grass.

W. W. BAILEY.

Brown University, Prov., R. I.

ENGLISH NAMES FOR GARDEN PLANTS

THE London (Eng.) Garden has taken a decided stand in favor of English names for garden plants, and I think rightly, too. In ordinary conversation who would ever think of talking about Convallaria majalis, Reseda odorata, Boussingaultia baselloides, Polygonatum giganteum, Narcissus Pseudo-Narcissus, and Nymphæa odorata, when we mean to speak of Lily-of-the-Valley, Mignonette, Madeira Vine, Solomon's Seal, Daffodils, Pond Lilies? There is a simplicity, beauty and sweetness in the common names not found in botanical ones. True, verbena, lantana, abutilon, fuchsia, aster, oxalis, and many others in common parlance, though really botanical, generic names, are, by their every-day use, understood as common English ones; in fact, the majority of the people who use them do not know them to be botanical names.

The English names that seem to me the most appropriate are those that have an obvious and descriptive meaning, as Pond Lily, monkshood, buttercup, blood-root, twin-leaf, sweet pea, snow-drop, golden rod, Evening Primrose, foxglove, cockscomb, and the like. But, after all, perhaps the prettiest names are the poetical ones, as the roses and lilies, daisies, pinks and pansies. Then there are many pretty imaginative ones, as Lady's-delight, Wandering Jew, Mother-of-Thousands, Bachelors' Buttons, Mourning Bride, Love-in-a-Mist, Love-lies-Bleeding, Venus's Looking-glass, Babies' Breath, and Star of Bethlehem.

Are we to relinquish these happy names, the names our children speak, the names our forefathers as children used, in favor of a harsh and formal botanical lore, and call an Iron Weed, Vernonia Noveboracensis; a Sun-flower, Helianthus annuus; a Snap-dragon, Antirrhinum majus, and a Sweet-William, Dianthus barbatus? Who speaks of Quercus, Acer, Fagus, Betula, when they merely mean to mention the oak, the maple, the beech or the birch?

A recognized botanical name is indispensable for every species among plants, and there are times when it must be used; but in every-day general use, when practicable, let us give high preference to the good old English names.

WILLIAM FALCONER.

Field Crops.

INFLUENCE OF MANURES UPON THE POTATO DISEASE.

PROFESSOR F. H. STORER.

IT has often been remarked by European farmers, and sometimes by American, that the manure employed upon potato fields may have no inconsiderable influence in pro-

moting the appearance and progress of the potato rot.

Hurtful effects have been noticed to follow in some instances the application of heavy dressings of farm-yard manure, and sometimes to be produced by Peruvian guano and by other "forcing manures"; and one or another explanation has suggested itself according as the natural or the artificial fertilizer appeared to be at fault. It has been supposed by some that spores of the rot-fungus might be harbored in some common plant eaten by cattle, and that these spores might be tough enough to pass unharmed through the animals and so be carried to the fields in the dung; while other observers have held that the increased luxuriance of the plant, brought about by the use of guano or other nitrogenous manure, was of itself a sufficient reason why the potato rot fungus should develop more freely in such plants than upon the less succulent vegetation of adjacent fields which had not been so strongly manured. It is a fact of familiar observation that those manures which contain much active nitrogen tend to develop the leafy parts of plants and to produce a rank vegetation of loose texture and juicy character such as is particularly well-fitted for the growth of the fungus which causes the potato rot. The advocates of the latter view have always had in their favor the well-known fact that the potato rot is specially liable to prevail when there is moisture enough either in the air or the soil to keep the plants in a succulent condition. The second view has the advantage, moreover, of being more general than the first, and indeed of including it, since it is plain that the nitrogen in stable manure may make the plants grow rank and succulent as well as that in the artificial fertilizers. That the second view is really the correct one seems to be borne out by some of the results of field experiments on potatoes made recently in Germany by Maercker, which show that the application of nitrate of soda tended very decidedly to increase the ravages of the disease. Thus, while the crops harvested from plots dressed with stable manure contained no more than five and six per cent. of diseased potatoes, crops taken from plots dressed with nitrate of soda showed from 11 to 12 per cent. of the diseased tubers.

No increase in the disease was noticed on plots manured with mixtures of stable manure and plain superphosphate of lime, and of stable manures and small quantities of ammoniated superphosphate, but when large dressings of the ammoniated superphosphate were used, in connection with stable manure, the proportion of diseased tubers was increased, in some instances to eight per cent. of the total yield.

In these experiments several plots manured in each of the different ways, were distributed and repeated in different parts of the field, and the results obtained from the different plots showed a remarkable agreement, as above stated. The influence of moisture was well shown in another set of experiments, made in another locality, where the disease happened to be much more prevalent. In this case the proportion of diseased potatoes varied from four and a half to 17 and a half per cent. of the total crops, on plots that had been manured alike. But it was noticed that the cause of these variations could justly be attributed to moisture which had collected in little hollows or depressions in the soil of some of the plots.

STOOKS, SHOCKS, STACKS.

THE criticism of your good-natured correspondent, "Kit," in the Corn Number, page 9, is by no means exempt from an error similar to the one he would correct. Although lexicographers have failed to record the proper distinction between stook and shock; yet intelligent farmers all over the country agree in the appropriate signification of the two words as employed by the producers of Indian corn. A stook of Indian corn consists of the stalks set up on the butt ends, in the form of a large gavel and bound at the tops. This cannot be properly denominated a stack, or a shock. A shock consists of a number of sheaves or bundles placed together on the butt ends. A shock may be long, round or of a square form; made up of a few, or a goodly number of sheaves. When buckwheat is raked up in gavels and placed on the butt ends of the straw and bound at the tops, the bunches are called stooks. A stack may be made of stooks, or shocks, or bunches, or sheaves, or of loose straw or haulms. Farmers do not call cocks of hay, stacks, but cocks. But if several cocks are placed one above the other, the pile is called a stack. Yet, one *may* call a cock of hay a stack, although it would not be using language in accordance with the most approved custom. Hence, persons who are accustomed to use the more appropriate words in the right places, say *stook* for a collection of stalks of unhusked corn, or a gavel of buckwheat, and *shock* for a small number of sheaves of any kind. There is just as much difference between a *stook* of corn and a *shock* of corn, as between a *cock* of hay and a *stack* of hay. Intelligent corn-raisers, the States over, will concur in the foregoing signification of stooks, shocks and stacks. CRITICUS.

Courage under Disappointment.

In answer to a circular from a Philadelphia seed house I got from them a package of what they called South American Corn—five kernels at two cents each. I planted them in the garden and nursed them carefully, but they turned out a failure. I also got a packet of "Canton Corn," which proved to be what I call very "small potatoes." Some "Hiawassie Corn" which the firm claimed to be "the most productive variety in the world," was a handsome white sort. For it I plowed up a piece of clover sod which was as rich as any soil on my farm—so rich that wheat or oats would have all lodged there. I put it in the best order and planted the corn, and tended it well. It grew 10 to 12 feet high without showing a sign of tasselling or earing. When my field corn—not over five rods from it—was in good roasting ears, there was not a sign of an ear on "the most productive corn in the world." My field corn gave 60 bushels per acre of as fine corn as you would wish to see, while on the promised wonder there were only a few little nubbins. It was all stalk and no ears. A package of Spring wheat from the same firm was sowed on a corner of the same piece of ground. It came up all right, but though I kept the ground clean not a stalk of it headed. Both the corn and wheat were put in before my own corn in May. Last Fall I received from the same parties 105 kernels of Australian Winter Wheat for which I prepared a piece of ground very nicely, planted the stranger, and am now waiting the result. I also got some White Russian Oats from a firm of grain dealers in Buffalo, and have high hopes with regard to the yield. I am by no means discouraged at the failures I have met, for my motto is the Scriptural injunction "Try all things and hold fast to that which is good.

Dixon, Ill. W. G.

Desirability of Stronger Winter Wheats.

As I am an old miller and still in the business, I wish to call attention to the importance of improving the quality of our wheat—Winter wheat. I think there has been too much attention given to increasing the yield regardless of quality. Our Winter wheats have been losing in strength, particularly the new varieties which are very deficient in that essential quality. If we could get a variety of Winter wheat that would yield well, and approximate in strength the hard Northwestern Spring wheat, it would be very desirable; and I have thought that this end might be accomplished by taking this Northwestern Spring wheat as a basis to start from, and either propagating new varieties from it or gradually changing it into a Winter variety. I make these remarks merely to call attention to the subject. W. J. Mc.

Steubenville, Ohio.

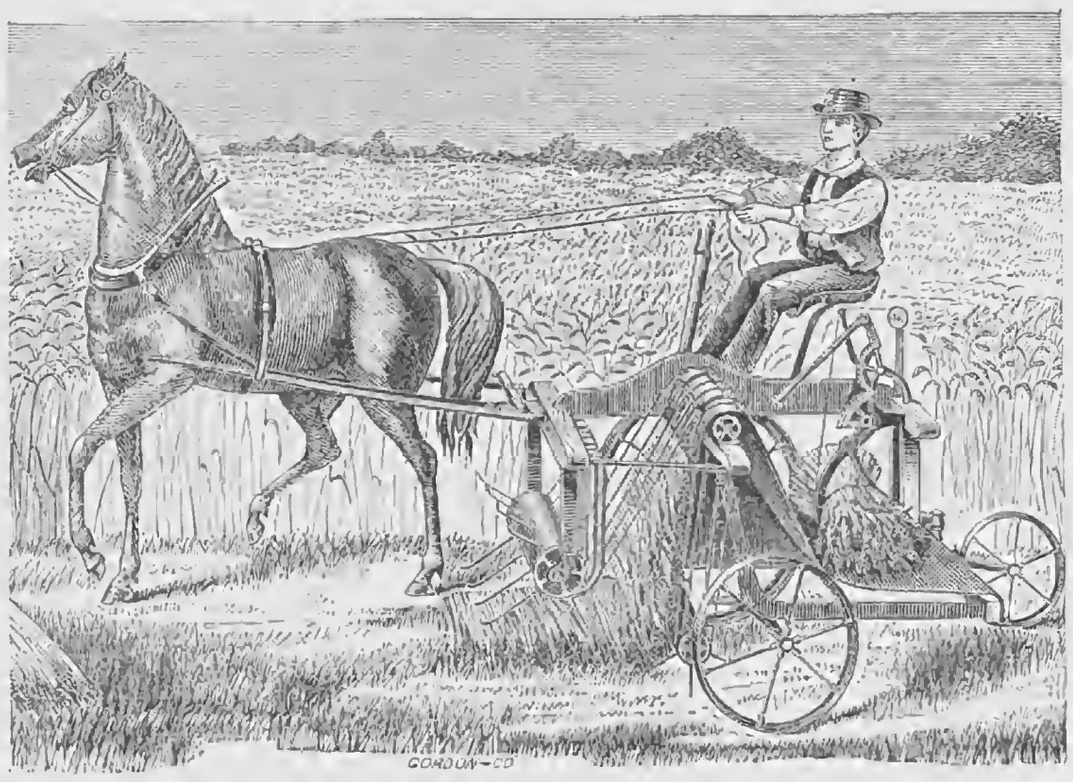
[Our friend will see that that is just what we are doing at the RURAL FARM.—Eds.]

Entomological.

ŒSTRUS BOVIS—THE OX BOT-FLY.

IN the issue of the RURAL for November 27, reference is made to this insect, with an estimate of the annual loss occasioned by it to those who raise cattle or furnish hides to the tanneries. The same article spoke of the ease with which the injuries might be checked provided all would take hold of the job. This led me to think that something on the habits of this insect might not be out of place.

All who have had the care of them have noticed that if the hand be passed over the backs of cattle at this season, a greater or less number of bumps or swellings are perceptible. These bumps are always found to be open, and inside is found a footless grub or maggot. These grubs are the cause of both the swellings and the holes, the latter of which cause the depreciation in the value of the hides, referred to in the article mentioned.



GLEANER AND BINDER OF THE JOHNSON HARVESTER CO. —FIG. 35.

The eggs that produce these grubs are deposited on the backs of cattle during the Summer by a large fly known as the ox bot-fly. They probably stick to the hairs like the eggs of the horse bot-fly, hatch in due time, when the grubs eat their way into the skin where they pass the whole of the larval period of their lives, reaching their maturity with the return of warm weather in the Spring. It is probable they do not cause a great deal of pain to the animal, though the swollen condition of the parts and the purulent state of the interior of the bumps indicate that they are a source of irritation to the system. The grub always keeps an opening to the hump because it must have air for its respiration, and it is through this opening that the air is obtained. The bumps are scarcely perceptible till the beginning of Winter, on account of the small size of the occupants up to that time. In the Spring these work their way out, fall to the ground, secrete themselves in the most sheltered place close by, and undergo their transformation to chrysalids. From these the flies in due time emerge. One writer describes the fly as "having a very hairy body, a large head, the face and forehead covered with light-yellow hair, the eyes brown and the antennæ black. The throat is yellow, barred with black, the abdomen of a grayish-white at the base, covered with black hair on the third segment, and the remainder of an orange-yellow. The wings are smoky-brown."

The remedy for these is very simple. During the Winter the grubs may easily be pressed out of their holes with the thumb, or the two thumbs, when they can be killed or left on the ground to freeze. The bumps will be found to vary in number from one or two to 30 or 40. If the grubs were removed from the backs of all of a herd, they would be found to be much less numerous the following Winter, but there would still be a few from the flies hatched from other herds. If all the owners of cattle in a community were to remove the grubs from the backs of their cattle this Winter, there would be scarcely one found in the same herds next Winter. It is hardly probable that more than a community would unite in an effort to exterminate the insect, but, as there is but one brood in a season, it is evident that if all owning cattle were to kill all the grubs, there would be no more trouble from them—at least for a long time. G. H. FRENCH.

Normal University, Carbondale, Ill.

Industrial Implements.

The Johnston Harvester Co.'s Gleaner and Binder.

We here present to our readers what promises to be one of the most valuable labor-saving machines in the country. As will be seen by the illustration, fig. 35, this is an independent binder and gleaner, and has the advantage that the grain can be bound at once or left in the field until cured, or until a more convenient time for binding it. It is simple in construction, binds with twine, making a secure knot that will not slip or give out. It has an adjustable gathering apparatus that can be easily adapted to the varying conditions of crop or ground, and it will bind after any reaper. We have watched the different successive improvements made in this implement until at last the manufacturers are prepared to put a limited number of them upon the market, confident that intelligent farmers can now use them successfully. This machine was thoroughly tested last season and made a good record. Its great utility will be recognized by farmers, as they can now get a binder without discarding their old reapers, and also can buy a reaper and independent binder for about the present price of a self-binding harvester. The orders for the line of regular machines made by the Johnston Harvester Co. are already so large that the number of these new implements must necessarily fall short. They will be put out in connection with the celebrated harvesters of the company, who will also fill such outside orders as their capacity to manufacture will admit.

Miscellaneous.

"TELL KNOWLEDGE—NOT GUESSES."

WHAT'S the matter with General Noble? He writes under the above heading as if he was in "a real state of mind." He reminds me of that old hypochondriac writer, Montaigne, who once wrote as follows: "I would have every one write what he knows; and as much as he knows; and no more. For such a person, having some particular knowledge and experience, as to other things knows no more than what everybody knows; and yet to keep a clutter with this little pittance of his, he will undertake to write the whole body of physics," etc., etc.—and yet he himself was full of whims and fancies.

Now, on to the wickedness of that "sap-sucker" writer, the General tacks a whole column of what I would fain call ill humor, only I cannot bring my mind to charge him with that. But he is mad about something evidently, or he would not say that these persons who so well express their ideas in the RURAL "write crudely and thoughtlessly." There, I say, General Noble is mistaken. Further, I think he is mistaken when he says that "no one has any right to declare what follows an event is its logical result." Because a man killed bark lice on his trees with linseed oil, the General painted his trees from top to toe and killed them, as well as the lice. Well, the logical result was proved, and the General ought to have been satisfied. That he laid it on too thick was his mistake. It reminds me of a man who asked me if salt was good for pigs. I told him, "Yes; pigs' need some salt as well as other animals and I always put salt in their slop barrel." The man having a beef barrel to empty, poured the brine and salt from it into the pigs trough, and the pigs being starved for it, ate several quarts and forthwith died. And the man was mad with me and talked precisely as the General does. Was that my fault or the man's? He should have used his reason, and so should we all when any man tells us what he has done and the result of what he did. All experiences are valuable, but they must be applied rationally. And so I say, "tell us not only what you know, but what you think you know, and I will consider over it and judge of it and make a sensible and rational use of it as far as possible." But if we are to tell only what we know of some things, we come to this—what do we know after all? The more one learns, the more he discovers how little he knows. What I thought I knew many years ago I am continually finding out was not of general application, but related to very narrow circumstances.

But should a person keep all that he thinks he knows to himself, lest his knowledge may be, after all, but a shrewd guess? How is it in scientific matters? How many things are being taken back by scientific men? and how much of a dozen years' old knowledge is exploded and dissipated to-day? But if those men had not published what they then knew, or thought they knew, we should not have reached the truth now. But is it the truth, after all? We cannot say. When a close, careful investigator found crawling and twisting things in certain liquids, he could not account for them excepting under the theory of spontaneous generation. When that notable book the "Vestiges of the National History of Creation" appeared, the scientific world was taken all aback, and a new theory of life was announced, based on certain facts. Some things were known and the logical result was, of course, unavoidable. Life was spontaneously generated. But when Pasteur took hold of the matter he found those facts were not facts, and gave us other facts which confounded them. Whether these new facts are facts, who can say? Time only will show. But some persons are very sanguine about them and so make out logically that General Noble and I and all of us come from some kind of stuff which they call protoplasm, climbing by degrees through infinite ages from insensible matter up to such intelligence as enables us to berate the poor man who believes the sapsucker really sucks sap. I don't blame the man who believes that. I don't know myself what that lively bird is after when he makes those curious rings of holes around a sound tree, but I do know positively that he will make holes in perfectly sound bark on young trees where no borers have been. Why may he not want to get his sweets or his bitters from under the bark; or why

may he not be amnsing himself as the bower birds do when they build up just snch "baby houses" as young children do?

The General is all wrong. Let us know what people think. I don't like to hear people say we know, and we know. I want to say I think I know, and I wonld have General Noble himself say the saine about the English sparrow. This is a nuisance certainly; but we don't know the good he does. Two years ago I berated him soundly for tearing open the ends of the corn ears. The past year I blessed him because he picked out of the corn ears the young worms which have been a thousand times the worse pest. I don't know but when I shot him two years ago, when he depredated on my corn, I helped to encourage the worms which last year spoiled thousands of ears. I would like to have the General's permission to say that I think this same sparrow, *in moderation*, is a serviceable animal and does actually kill off this corn worm if we will let him: and that when he tears open the ears, he is, like the General's sapsucker, after his grub. But I don't know it; in fact, there is not much that I do know, and therefore I wish, with General Noble's permission, sometimes to say what I think. H. S.

RURAL BRIEFLETS.

THERE are statements going the rounds of the press to the effect that the farm of the Stewart estate (Garden City) is highly productive. "From 2 500 acres," this is the gist of the statement, "formerly believed to be worthless, there were obtained last year 20,580 bushels of oats, 31,500 bushels of shelled corn, 5,000 bushels of buckwheat, 600 bushels of wheat," etc. The above figures, if the product per acre be figured out, give little to boast of. We rode over this farm when the harvest was close at hand, and we have rarely seen poorer crops on any part of Long Island.

MR. J. J. PRYOR writes us from Nashville, Tenn., that the most delicious potato he has ever eaten in Winter is "second crop" Beauty of Hebron. . . . . .

NOT enjoying a personal acquaintance with Marshall P. Wilder, the veteran horticulturist of Massachusetts, we have sometimes wondered why he inspired in such an unnsal degree the affection and respect of all who know him. We fancy that the following extract from Mr. Meehau's account of a visit to his home reveals the secret: "But among the greatest of all pleasnres was it to halt every once in a while and listen to his tales of his contemporaries. He would now have a word of praise for this one for what he had done, or some sort of commendation for another. Now he would start to show how this one had scarcely had enough credit for this, or that he should always be remembered for something else. What a pleasure it is to be with one who brims over with good-will to all and malice towards none. . .

WHAT a pity it is that all of us cannot so forget ourselves as to be both willing to appreciate the merits of others and to do justice to them. How charming—how altogether lovely is benevolence! . . . . . ,

E. E. THORNE, the Superintendent of the Farm Department of the Ohio State University, writes as follows:

EDITOR RURAL NEW-YORKER:—"The annual "Lecture Course," of the Ohio State University began on the 11th. We expect an attendance of 100 to 200 farmers. In preparing a lecture on "wheat" for this course I have found more valuable material in my files of the RURAL NEW-YORKER for 1879 than in all the other agricultural papers I receive." . . .

What Others Say.

A NEW LINE OF FARMING.—Dr. Hoskins tells the Home Farm (Maine) that he has grown seeds for upwards of a dozen years, and his sales have ranged from $100 to $800 per year. He has a single contract to grow peas next season for a New York party, that, with a fair crop, will net him $400. And yet he has only 12 acres, on which he has 1,400 fruit trees in orchard, 1,000 currant and gooseberry bushes, one-half acre of strawberries, one acre in nursery, etc.

MR. CLARE SEWELL READ'S ADDRESS on a late occasion, says the London Live Stock Journal, contained one or two points worth noting; this, for instance—that the Eastern States of America are already beginning to feel the competition of the West almost as folks do in England; and, again, that changes in agriculture are going on in those Eastern States very similar to those English papers have so often discussed as being desirable at home. Some lands have almost gone out of cultivation. There is a general desire to grow less corn and more grass.

INFECTED MILK.—The British Medical Journal reports a serious epidemic of typhoid fever at Worthing, due to infected milk. In all there were 44 cases, eight proving fatal, all of them occurring among the consumers of milk from a certain dairy, where a case of typhoid fever had occurred. It was noticed also that those who habitually drank large quantities of cold milk were the chief sufferers. Those who had only a small amount in their tea or coffee, or who drank the milk after it had been boiled, seemed to have escaped the disorder. The epidemic was at once arrested on discovering the source, and the place is now free from the disease.

CANADIAN VS. UNITED STATES APPLES.—The following is from a writer in the London Garden: "In Covent Garden I heard a very good account of Canadian apples, and was surprised to learn they were beating the American produce out of the field. There seems some reason for this, as the Canadian apples are better packed; the American barrels are usually "topped up," in market parlance—a layer or two of good fruit at the top, and then fruit of poor quality below. On the other hand, the Canadian fruit is generally fairly good throughout, the barrels are well packed, and considerably larger than those of the Americans. A very excellent apple which has been coming in large quantities is the Golden Russet; it has a high and rich flavor. In some sales lately, Canadians, when compared with Americans, were in the proportions of over six to one. This must be very encouraging to the Canadians, and should teach the Americans to pack honestly if they wish to keep their trade.'

BERMUDA POTATOES.—There are many persons who think that the so-called Bermuda potato is a distinct variety peculiar to the island, says the N. Y. Sun. This is not true, however, for Bermuda has to depend upon the United States for a supply of seed annually. Of late years the Garnet Chili is the variety principally planted; nearly all the stock is sent from this city, and in a few months they come back to us under the name of Bermuda potatoes. The climate of Bermuda is not favorable to the keeping of potatoes; consequently, no stock for seed is preserved; in fact, the inhabitants of Bermuda and nearly all the West Indies have to obtain their supply of potatoes for Summer and Winter use from our Northern States.

Everywhere.

RURAL SPECIAL REPORTS.

N. Y., Waterville, Oneida Co., Jan. 4.—This is a fine farming country. Hops and dairy produce are our chief productions. The past season has been exceptionally good for all crops, except hay, which is now selling at from $16 to $18 per ton. Hops have brought a fair price—from 16c. to 21c. per pound. One farmer, Mr. J. J. Bennett, has about 70 acres of hops, and sold his crop this year for about $20,000. I am a market gardener, and at no time since I have been in the business—six or seven years—has the season been so favorable for all kinds of vegetables. I have sold, from seven-eighths of an acre, $365 worth of truck, besides all the vegetables used in a family of six, and I have $75 worth yet to sell. I do all the work, with the exception of the help of a small boy for about a month in the busiest season. I "work out" "some" myself, and have earned about $100 working for others the past year. I enjoy work, and am never happier than when in my garden with a hoe or rake in hand, and when my day's work is done I like to take up the RURAL and read about the work of others. A. W.

N. C., Brookston, Warren Co., Jan. 2.—Up to November 15 the weather was all that could be desired, and those farmers who drove their work along were fortunate in securing their corn and cotton; but we were looking for our usually fine weather during the last part of November and well along towards Christmas. From the 7th of December to the 15th we had clear weather, which gave those who had their crops still in the field an opportunity to partially "catch up." With this exceptional week we have had no time suitable for any kind of farm work since the middle of November, as we have had either rain, sleet or frozen soil all the time. Very little wheat has been sown, and any sown after this will be too late to make more than half a crop. The wheat crop of this State at best is but "a drop in the bucket" compared to that of the country, yet if we are obliged to buy nearly all we need it will be a considerable drain upon our people. Fortunately we made a heavy crop of corn, and indications point to good prices for those who have a surplus. Prices for products are fair, with an upward tendency. Bright tobacco brings more money than for several years so early in the season. Cotton flits up and down about every day, averaging for the three months about 10c. Corn is worth 45c. to 50c.; wheat, $1.25 for white; cow-peas cannot be bought for much less than $1, though I believe the merchants are buying in a small way for less. Fodder, $1 per 100 lbs.; eggs, 20c. to 25c. Stock went into Winter in much better condition than usual, but Spring will undoubtedly find them thin enough, though I am happy to be able to note a decided improvement in the attention and care given our cattle and hogs in the past few years. M. B. P.

VA., Palneville, Amelia Co., Jan. 4.—Since my last letter of Oct. 4th, we have had rough weather for the season in this section. We had ice three inches thick in November and many persons half filled there ice-houses. On December 20, snow fell to the depth of six inches, and on Christmas Day it snowed again thick and fast, but I look on it as a blessing, as we had so much dry weather for the last three months that it was quite a serious matter. The farmers at this time are a little downcast as we failed almost entirely with tobacco, and wheat was a short crop, and these are the money crops, so that, of course, farmers feel a little discouraged, but the distress is more imaginary than real among those who have lived within their incomes. But the trouble is there are so many that go far beyond their means and then look for abundant crops and high prices to bring them out of the difficulty; so that when failure comes, they are ruined. We made an abundant crop of corn which is selling for 30 cents per bushel locally; but it was worth 50 cents in Richmond which is our chief market, and some farmers are now shipping there to sell. My Ovoid Mangels were the wonder of the neighborhood. I sowed them too thick, and it was very dry weather, and yet I got 96 roots weighing a fraction over 500 pounds. The wheat was put in quite early last Fall, generally, and was looking very well until the cold, dry, freezing weather set in which injured it somewhat; but I think the present snow will bring it out all right. I did think of giving you some of my experience with corn; but after your great yield I am almost ashamed to do so; however I will tell you what I made on three and half acres of land. It was creek bottom that had been in constant cultivation for 30 years, as far as I can learn, without fertilization of any kind whatever, and two-thirds of that time it was in the hands of tenants who cultivated it in corn exclusively, and allowed the water to deposit sand over one-third of it; the rest was well set with wire grass. I plowed it thoroughly in January with an Oliver chilled No. 20 plow, seven to eight inches deep, and let it lie until April 17, when it was again plowed and harrowed, the rows being struck off four feet, and the corn dropped by hand thirty inches, as near as may be, and covered with a one-horse cultivator. It was cultivated three times with plow and cultivator, and twice with the hoe, and without one ounce of fertilizer I harvested one hundred and fifty and a fraction bushels of good corn. This, although not a large yield for the acres, will do pretty well, I think, for poor old Virginia land like this. One of my neighbors on good new bottom land made as high as seventy bushels to the acre. J. W.

VA., Nokesville, Prince William Co., Jan. 3. We have had unusually cold weather, and now there is over a foot of snow on the ground—more than has been seen here for the last 25 years. Our crops were good—wheat over an average; corn good; oats light. Barley is not much grown hereabouts. Amber-cane was just introduced for the first time this year, some of us having made a trial of it on a small scale. We expect to raise more the coming season. Live stock went into winter quarters in good condition. We have a heavy stock of light, scrubby horses in our county; but our worthy brother Clark, Master of Nokesville Grange, went to Ohio this Fall and purchased a Norman Percheron stallion, and so we have hopes of better horses in future. In cattle we have Short-horn grades—fair animals. We also have Down sheep and Berkshire hogs. Land is cheap here. We want more immigrants of the laboring class. We have room for thousands of people here. L. Y. A.

The Querist.

ANSWERS TO CORRESPONDENTS.

ANSWERS TO MANY READERS.—We cannot sell Rural Branching Sorghum, Chester Corn, the White Elephant Potato or the foreign Asparagus, or anything else except the RURAL. If our friends would scan the advertising columns, some of the above questions would there find an answer. For the rest, we commend them to the catalogues soon to be noticed.

Losing the Cud—"Hollow Horn."

U. T. S., Sedalia, Col., asks, 1, whether there is such a thing as a cow losing the cud, and on that account becoming sick and dying; 2, is there any such disease as "hollow horn?"

ANS.—There is a disease known as losing or dropping the cud. It arises either from indigestion due to feeding on unwholesome food and acrimonious plants, or to over-feeding on rich, succulent pastures. Sometimes, however, it is caused by a diseased state of the liver. In the early stages the bowels are somewhat irregular, the animal appears dull, the coat is rough, and though the appetite may be as good as usual, the food is dropped more and more from the mouth as time goes on. Often quite a quantity of a thick green fluid is dropped in ruminating. As the disease advances the appetite diminishes and becomes capricious; dysentery comes on; the animal ceases chewing the cud; the eyes and mouth appear yellow, and a general unthrifty condition supervenes, and if the liver has become much affected, the disease terminates fatally. A cure should therefore be attempted at an early stage. If there is any costiveness, mix and give in a quart of warm ale, if convenient, if not, warm water will do: Epsom salts, 12 ounces; gentian, 1 oz.; ginger, 1 oz; carbonate of soda, 1 oz.; or:—Castile soap, 6 drachms; ginger, 3 drachms; Barbadoes aloes, half an ounce; Cascarilla bark, 2 drachms, warm water, one pint—mix. Often the bowels are loose, but the dung has an unhealthy appearance; then give morning and night the following drench in a pint of ale:—Carbonate of soda, 2 drachms; ginger, 3 drachms; Cascarilla bark, 3 drachms. The animals should be kept warm at this season. 2, There is no such disease as "hollow horn," although a few intelligent farmers here and there, and a greater number of "old fogy" farmers still believe in this exploded fallacy. Very early in life a cavity begins to form in cattle in the bone of the skull beneath the horn, and penetrates this, continuing to enlarge during the life of the animal. In old animals the horns consist of a thin shell of bone with a large cavity inside, divided, perhaps, by a thin, bony partition, and lined with a delicate, sensitive mucous membrane. This is the *natural* condition of the horn, designed by Providence to lighten what would otherwise be heavy and cumbersome. Attention was probably directed to the horns as the seat of the disease because in all serious troubles the extremities—the ears, horns and limbs—are cold, or alternately hot and cold. On boring they were found to be hollow, while it was supposed they should be solid, and it was therefore mistakenly supposed they were the chief seat of the disease, and the wretched animals, already ailing, have over and over again, been subjected by ignorance and quackery to keen suffering on account of their horns being pierced with gimlets and filled with irritating matter.

Quince Culture, etc.

O. C. Y., Liberty Center, Ohio, having planted several hundred quince trees last Spring, asks, 1, how to treat them so as to secure the best results as regards health, strong growth, and the size, quantity and quality of the fruit. Should they be kept dwarfed in a spreading bush form or trimmed up as standards, and do they need salting to make them vigorous bearers. 2. He has also a young pear orchard and he wishes to learn what to do to prevent blight, some of the trees having been already attacked by that pest, the second year after having been set out.

ANS.—If the ground is not such as would produce a good crop of grain, make it so by dressings of manure. Keep the soil mellow and free of weeds—cultivate shallow. We prefer the "spreading bush form," only cutting out all stems that are too close together or cross each other. As to the use of salt—most people *suppose* that it is beneficial to the quince. We know of no experiments having been made which offer any *proof* in the matter. We may say that quinces may grow vigorously and bear abundantly *without* salt. 2. It is our belief that a wash of carbolic acid, lime, sulphur, etc. (such as we have often recommended), applied in May, August and November, is an excellent preventive of blight. Prof. Burrill, as we have stated, finds that bacteria cause pear blight, and he believes that the yellows of the peach is also caused by these minute organisms, though specifically different, probably, in the two cases. Prof. Burrill made experiments last July by inoculating healthy trees with the bacteria procured from diseased trees. These inoculations are made by inserting a knife or needle "smeared with the living bacteria" in the bark of healthy trees, and observing carefully the results from day to day. More than half of the branches thus treated were affected with blight in from eight days to six weeks. Now, the question is, whether a tree covered with such a wash would be attacked by these minute organisms.

Queries About Apples and Pears.

"*Apple Tree*," *Brooklyn, N. Y.*, asks, 1, what is the best season for planting apple trees; some, he says, make a short trench and fill it with stones, over which they place a little earth and thereon plant the trees, with this drain under them, and our friend asks, 2, if that is the proper way to do the job; 3, which would it be best to plant most of—apples or pears; and which would be the best varieties of each for the above locality; 4, what kind of soil is best adapted for apples and pears—is high ground better than elevated soil; 5, is

the soil of New Jersey as well adapted to these fruits as that of New York; 6, what is the best way of storing apples and pears.

ANS.—1. Spring. 2. It is a senseless plan. The drain is no drain at all. One might as well set a barrel in the soil and call that a drain. 3 Most of pears—Bartlett, Belle Lucrative, Beurre Bosc, Beurre d'Anjou, Beurre Giffard, Clapp's Favorite, Doyenne d'Eté, Duchesse d'Angouleme, Howell, Josephine de Malines, Lawrence, Seckel, Sheldon, Urbaniste, Winter Nelis. APPLES—Baldwin, Early Harvest, Fall Pippin, Fameuse, Golden Russet, Gravenstein, Hubbardston Nonesuch, Jefferis, Large Yellow Bough, Mother, Northern Spy, Peck's Pleasant, Red Astrachan, R. I. Greening, Roxbury Russet, Talman's Sweet, Twenty Ounce Apple 4. They will do best in soil that will grow 75 bushels of shelled corn to the acre. We do not understand the difference, perhaps, between "high ground" and "elevated soil." Certainly a well-drained soil is needed for successful pear or apple culture. 5. Yes Of course, the *varieties* would need to be changed. 6. The best way to store apples, so far as we know, is to place them in a dark place where the temperature may be maintained as nearly as possible at 32 deg., never going below.

Jersey Cattle and Cotswold Sheep.

J.S., Twin Oaks, Ky., asks, 1, what is the scale of points of Jersey cattle and, 2, also a distinctive description of Cotswold sheep.

ANS —1, Scale of points, as adopted by the Royal Jersey Agricultural and Horticultural Society, as given in the Herd Register of the J. C. C., Vol. I., 1871.

BULLS.

ARTICLE.	POINTS.
1. Head, fine and tapering	1
2. Forehead, broad	1
3. Cheek, small	1
4. Throat, clean	1
5. Muzzle, fine and encircled by a light color	1
6. Nostrils, high and open	1
7. Horns, smooth, crumpled, not too thick at the base, and tapering, tipped with black	1
8. Ears, small and thin	1
9. Ears, of a deep orange color within	1
10. Eyes, full and lively	1
11. Neck, arched, powerful, but not too coarse and heavy	
12 Chest, broad and deep	1
13. Barrel hooped, broad and deep	1
14. Well-ribbed home, having but little space between the last rib and the hip	1
5. Back, straight from the withers to the top of the hip	1
16. Back, straight from the top of the hip to the setting-on of the tail; and the tail at right angles with the back	1
17. Tail, fine	1
18. Tail, hanging down to the hocks	1
19. Hide, mellow and movable, but not too loose	1
20. Hide, covered with fine, soft hair	1
21. Hide, of good color	1
22 Fore-legs, short and straight	1
23. Fore-arms, large and powerful, swelling, and full above the knee, and fine below it	1
24. Hind-quarters, from the hock to the point of the rump, long and well filled up	1
25 Hind-legs, short and straight (below the hocks), and bones rather fine	1
26. Hind-legs, squarely placed, and not too near together when viewed from behind	1
27. Hind-legs, not to cross in walking	1
28. Hoofs, small	1
29. Growth	1
30. General appearance	1
31. Condition	1
Perfection	31

COWS AND HEIFERS.

ARTICLE.	POINTS.
1. Head, small, fine and tapering	1
2. Cheek, small	1
3. Throat, clean	1
4. Muzzle, fine and encircled by a light color,	1
5. Nostrils, high and open	1
6. Horns, smooth, crumpled, not too thick at the base and tapering	1
7. Ears, small and thin	1
8. Ears, of a deep orange color within	1
9. Eye, full and placid	1
10. Neck, straight, fine, and placed lightly on the shoulders	1
11. Chest broad and deep	1
12. Barrel-hooped, broad and deep	1
13. Well-ribbed home, having but little space between the last rib and the hip	1
14. Back, straight from the withers to the top of the hip	1
15. Back, straight from the top of the hip to the setting-on of the tail; and the tail at right angles with the back	1
16. Tail, fine	1
17. Tail, hanging down to the hocks	1
18. Hide, thin and movable, but not too loose	1
19. Hide, covered with fine, soft hair	1
20. Hide, of good color	1
21. Fore legs, short, straight and fine	1
22. Fore-arm, swelling and full above the knees	1
23. Hind-quarters from the hock to the point of the rump long and well filled up	1
24. Hind-legs, short and straight (below the hock), and bones rather fine	1
25. Hind-legs, squarely placed, not too close together when viewed from behind	1
26. Hind-legs, not to cross in walking	1
27. Hoofs small	1
28. Udder full in form i.e., well in line with the body	1
29. Udder, well up behind	1
30. Teats large and squarely placed. Behind wide apart	1
31. Milk-veins, very prominent	1
32. Growth	1
33. General appearance	1
34. Condition	1
Perfection	34

In the scale of points adopted by the N. Y. State Agricultural Society the above scale has been copied almost *verbatim*, but 10 instead of one is the mark of perfection on each point, and lower numbers are used as each is thought to approach more or less to perfection, while the Jersey Society gives no mark unless sufficient perfection is reached on each point. The N. Y. Society also adds 10 for pedigree on the sire's side and 10 for pedigree on the dam's, making the aggregate of perfection on bulls 330 and on cows 360, instead of 31 and 34, as in the Jersey scale.

2. The description of a well-bred Cotswold is as follows: The face and legs are white, but sometimes dashes of brown or gray derived from the original stock, may be found on both face and fore-legs. The head is strong and massive, with sometimes a Roman nose, without horns, and having a thick forelock of wool upon the forehead. The neck and fore-quarters are not so square and heavy, nor the brisket so prominent as in the best Leicesters, but the hind-quarters are square, full and broad, and the thigh solid and heavy. The back is straight and broad, and the ribs well sprung, giving a round body; the flanks are deep; the legs are clean, of moderate length, but the bone is not so fine as in the Leicester. The general style and appearance are good and attractive, and indicative of a vigorous, active, and hardy animal and a prime mutton sheep. They are active and well fitted for gathering a living upon a pasture in which a Leicester would hardly thrive. The lambs are active and hardy, and the ewes are good mothers. The fleece is closer upon the back than that of the Leicester, and only in aged rams exposes the skin along the middle. The wool sometimes reaches a length of nine inches, and although coarse, is soft and mellow. In some of these sheep, the fleece is beautifully waved.

Leveling uneven Sloughs, etc.

C. W. C. L., Davenport, Ia., asks, 1, the best way to level uneven sloughs; 2, what will be the result of applying salt to barley as a preventive of rust.

ANS.—1, the best method depends very much upon the character of the ground. If the sloughs are ever dry, they should then be plowed and scraped with a horse shovel and leveled. If always wet, they must be drained in some way. Drainage is the best treatment for these wet spots: for once drained they become rich ground and soon pay for the work and expense laid out upon them. 2, Salt can only exert an effect in the way indicated, by strengthening the straw and enabling it to resist the disease which produces the rust. This is doubtless caused by a weakness in the cellular tissue of the straw, which permits the sap to exude and furnish an opportunity for the rust spores to germinate. Salt has the effect of invigorating the straw, and may thus enable it to avoid this trouble. Whatever strengthens the even vigor of the plant acts favorably in preventing disease. On rich soil an uneven vigor may be produced and disease be encouraged; lime, salt and potash, all alkaline substances, supply the needed elements to counteract this tendency to over-luxuriance that is unbalanced, and consequently a source of weakness.

Cranberries on Uplands.

E. E. B., Windham Co., Conn., wishes to know if cranberries can be grown profitably on upland and without water; if they can be grown on upland, what variety is best, and is there anything difficult about raising them in that way.

ANS —About the year 1840, when cranberry cultivation first began to attract public attention, and a few years later, several parties in Massachusetts and New York experimented with them on uplands, using the same sorts as were cultivated on flooded meadows. At first they thought they were successful, but after a few years of trial, they were given up, so far as we have been able to learn. This was not because cranberries could not be grown on upland, but because the vine and fruit there were subject to so many more casualties than when flooded, and the yield of fruit was so much less, they could not be grown at a profit. It might be an object for any one particularly fond of this fruit, who resided where he could not obtain it at a moderate price, to cultivate a small patch of it in his garden. For the best method of planting the vines and their cultivation, see the RURAL of Dec., 4, page 799, with this slight difference—after the plants commence growing, treat them exactly as you would corn or any other hoed crop.

Hen Manure.

L. Y. A., Nokesville, Va., asks, 1, how much hen droppings should be drilled in with wheat to produce the same fertilizing effect as 300 lbs. of ground bone; 2, what can be mixed with the droppings to increase their bulk without lessening their fertilizing value; 3, what should be add to 50 or 60 bushels of cattle droppings, so as to make enough manure to go over 15 acres of corn.

ANS.—1. Three hundred pounds of bone contain about 70 pounds of phosphoric acid, and it would require about 2,500 pounds of hen manure in the partly dried state in which it is generally used, to supply 70 pounds of phosphoric acid. 2, Nothing can be added to the droppings to enrich them, as they are already the richest manure made on farms: 2,500 pounds would contain about 80 pounds of nitrogen which would be equal to that contained in the same amount of bone; so that while the half-dry hen manure is not so rich in phosphoric acid, it is about equal in nitrogen to bone. 3, The 50 to 60 bushels of cattle droppings would be about sufficient to give a small shovelful to each hill of corn on one acre. Rather than go to the trouble of mixing anything with this, it would be better to use it as far as it will go and then procure some corn fertilizer for use in the hill or broadcast. Read over our Corn Number carefully again.

A Sterile Cow.

M. B. P., Brookston, N. C., has a three-year-old grade Jersey heifer that dropped her first calf when two years old, and then gave promise of becoming a superior cow. Last Spring, however, she aborted—on account of an accident—a month before the calf was due. She has been milked this Summer and is yet giving three quarts a day; but though she has been "served" twice she is not with calf, and as our friend has never before owned an aborting cow, he asks the best treatment for this one.

ANS.—It is quite probable the cow is all right: unless the accident which caused the trouble did some permanent injury, there is no reason why the cow should not breed again. It would be well to keep milking her and have her served regularly until she becomes in calf or is found to fail altogether. In the latter case she may continue to milk along, and should be well fed to increase the quantity of milk. It is not unusual for cows, especially in a dry season, to require repeated services before getting with calf.

Miscellaneous.

J. J. P., Nashville, Tenn., asks, 1, from whom did we buy the fertilizers used at the Experiment Farm on our late large corn crop: 2 from whom can he buy seeds of the Rural Branching Sorghum and the Golden Ovoid Mangel.

ANS —1, From the Mapes Fertilizing Co., 158 Front St., N. Y. 2, The Rural Branching Sorghum is not for sale *anywhere*. The RURAL has all the seed known to have been produced from last year's crop, all of which, so far as we can learn, was grown upon six acres. Notice is given to subscribers who succeed in raising seed from the seed which we shall send out, that a ready market in N. Y City is waiting for them. The Mangel is offered in several of the catalogues which will be noticed in this journal in a few weeks.

G. H. A., New Haven, Conn., asks "whether Iris Kæmpferi should be transplanted in the Spring or Fall; 2, does it belong to the bulbous iris tribe; 3 what is the distinctive peculiarity of the *suffruticosa* section of the Perennial Phloxes?

ANS'—1, The Iris may just as well be transplanted in the Spring. There is no plant of the Iris, Amaryllis, or Lily family, whose cultivation we can more heartily recommend. 2, Creeping tuberous roots, not bulbs. 3, As distinguished from *decussata*, the stems are more dwarf and slender—the leaves more glossy.

A. A. P., St. Mary's, Canada, says that a man has been traveling thereabouts selling Yellow Hackberry Corn at $3 per bushel, and professing that it would ripen in from 90 to 110 days, and our friend inquires whether it is a good sort and if it will ripen in the time stated.

ANS.—We know nothing about it. The value of any new variety of corn in a given place can be ascertained only by trial. We should not pay such a price for seed corn unless we had full confidence in the person offering it.

C. W. C. L., Davenport, Ia., asks how to can green peas for Winter use.

ANS.—The peas should be put in the cans with sufficient water to cover them only. The covers are then soldered leaving a pin-hole for the steam to escape. The cans are then boiled for two hours and, as they are removed one by one, a drop of solder is put on the pin-hole to close it. The cans are then put in a boiler and boiled for one hour longer. Then they may be stored away.

E. H. P., has some fine Brahma hens, but they are not good layers, and he asks what breed are the best layers and the most profitable in all respects.

ANS —No matter what the breed, excellent care is necessary to make them lay. The Leghorns are probably the best layers—the Black Hamburghs also rank high in this respect. For all purposes, we have never found any breed more satisfactory than Plymouth Rocks.

C. M., Albion, N. Y., Address the Pope Manufacturing Co., 595 Washington St., Boston, Mass., for circulars respecting the Columbia Bicycle, which will be promptly forwarded. We have ourselves examined these bicycles. They are of first-class workmanship and are all that they are represented to be.

Subscriber, Park Ridge, N. J., asks whether salt mixed with food for pigs, is, or is not injurious.

ANS.—This query is answered under "SWINEHERD."

Industrial Topics.

COMMISSIONER LE DUC'S ACTION WITH REGARD TO PLEURO-PNEUMONIA.

A Charge Refuted.

IN the course of an article contained in the Ohio Farmer of the 1st inst, under the caption of "Is Gen. LeDuc to be Removed?" occurs the following language:—

"Gen. LeDuc is proposed for the Secretaryship of Agriculture in the Cabinet. That should demand wise foresight and a thorough, intellectual and business grasp of the entire situation, and wisdom to counsel wise legislation. He who fills that place should be a leader. Has Gen. LeDuo proved himself to be one? Take the case of pleuro-pneumonia. He gave no public proof of knowledge of its existence, magnitude and dangerous character till private, State and national interference had definitely marked and mapped its territory and hemmed it in. He showed no appreciation of its influence on our export trade in cattle till President Hayes sent a special Commissioner to England to inquire what could be done."

The writer of the above is wrong *in toto*. To show the great injustice which he has done the Commissioner of Agriculture in the above charge we have but briefly to recall the action of Gen. LeDuc in the investigation of diseases of farm animals—an investigation which he instituted, as the published records show, almost immediately on his accession to office. No other Commissioner had done anything in this direction, and to him alone is due the present interest manifested in the subject of the suppression of that terrible disease known as contagious pleuro-pneumonia of cattle. And now to the record:—

Investigation Commenced in '77.

As early as August, 1877, during the second month of his administration, he caused the following circular letter to be forwarded to each member of the House of Representatives:

DEPARTMENT OF AGRICULTURE,
WASHINGTON, D. C., Aug, 1877.

SIR: This Department is making a thorough investigation into the causes of the many diseases now, and for some years past, prevailing, with such fatal effect, among the farm animals of this country. In order that this work may be facilitated, and the Department put in possession of information that will enable it to form a correct understanding of the extent, nature and character of these diseases, and of the remedies indicated therefor, I would thank you for the names and post office addresses of some of the more prominent stock and poultry dealers and breeders of your district, and also the addresses of respectable veterinary surgeons who have had experience in this direction. The names should include those of persons residing in localities where diseases of a general and local character prevail, either among horses, cattle, sheep, hogs or poultry.

I remain yours, very respectfully,
WM. G. LE DUC, Commissioner.

Members of Congress seem to have promptly responded to the above request, for we find that during the same month the Commissioner forwarded the following circular letter to one or more correspondents in every county of the United States:

DEPARTMENT OF AGRICULTURE,
Washington, D. C., Aug. 1877.

SIR:—This Department, being desirous of making an investigation into the causes of diseases now, and for some years past, prevailing among all classes of farm animals, desires your assistance and co-operation in the proper consideration and determination of a subject of such great importance to the stock breeders and growers of this country. With the view of saving millions of dollars annually by the timely use of such remedies and preventives as are now known or may be discovered by this investigation, the Department desires, as speedily as possible, to be put in possession of such facts as may have come under your observation in relation to diseases affecting horses, cattle, sheep, hogs and fowls, either in your own neighborhood or in adjacent localities. Have the kindness to give as complete a diagnosis of the disease as possible, stating the duration of the attack, its average fatality, what remedies, if any, are used, and with what success. In localities where diseases prevail among more than one class of animals, separate statements should be made under the name of the animals affected. Very respectfully, &c.,

WM. G. LEDUC, Commissioner.

Early Results.

This circular letter elicited a vast amount of information, which was called for by resolution of the Senate on February 20, 1878 and was forwarded to that body by President Hayes, accompanied by a short message, on the 27th day of the same month. This information was speedily published by order of the Senate, as Senate Executive Document No. 35, 45th Congress, Second Session. In the letter transmitting this information to the Senate, Gen. DeDuc says:

"For some years past the local press, and especially the agricultural journals of the country, have been calling attention to the increase of diseases among farm stock, and the consequent heavy losses annually sustained by our farmers and stock breeders and growers. I regarded the subject as one of such vast importance to the productive industries of our country as to demand the immediate attention of this Department."

(Continued on page 57.)

THE
Rural New-Yorker,
PUBLISHED EVERY SATURDAY.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, NEW YORK.

SATURDAY, JAN. 22, 1881.

WE want the Director of the New York Experiment Station, as the Ithaca Club says, to be a man who has clear conceptions and a just appreciation of science. Such a one can *suggest* lines of scientific experiment that may be more valuable than any the scientist can suggest.

SEVERELY just criticisms on the sins of commission and omission of public officials are not only the privilege but the duty of the public press; but a fair measure of care should be taken in investigating the subject discussed before attributing blame, lest in the desire to benefit the public, injure a public functionary, or advance some private interest, injustice may be committed. Elsewhere in this issue, it is clearly shown that the charge made by a highly esteemed contemporary against the Commissioner of Agriculture, with regard to his action concerning pleuro-pneumonia, is entirely unfounded.

THE RURAL ILLUSTRATIONS.—Thus writes Col. F. D. Curtis: "The new departure of the RURAL NEW-YORKER in furnishing its readers with life-like or exact pictures of animals, as nearly as they can be transferred to paper, is an enterprising and honest attempt in the right direction. These pictures may not *flatter* the animal, but they are real, and on this account valuable, because they give a correct idea of the animal or breed, whereas the common illustrations of animals and breeds are often fanciful—purchased cuts which are made to sell and are used for different animals and different breeds. These cuts, always 'on hand,' are much cheaper, but coupled with their cheapness there is delusion and fraud. They deceive their admirers and are not what they represent. The attempts of the RURAL to right this wrong are praiseworthy, and should be sustained by all honest breeders."

A SAD LOSS.—Fires in country places seem to be unusually numerous and disastrous this year, but the most lamentable that has come to our notice is the horrible destruction of the splendid herd of Jersey cattle at the Elizabeth farms near Brickville, Pa., between 12 and one o'clock last Saturday night. The herd numbered 52 registered Jerseys, including the bull Coxswain, valued at $3,000, and was the finest Jersey herd in Pennsylvania, if not in the entire country. It belonged to the estate of the late G. D. Coleman, of Lebanon, and was under the management of Colin Cameron. The barn in which the animals were stabled, together with a large amount of hay and other property, was entirely consumed. Above the roar of the flames rose the agonized groans and bellowings of the cattle as they were roasted alive chained in their stalls. The fire was decidedly incendiary, and the money loss about $40,000. In some of the States arson is still a capital offense—does not the cruel, malicious wretch who caused so much suffering and loss deserve the halter?

A DESIRABLE BEGINNING.—The weather warnings of the Signal Service have hitherto been of practical use almost exclusively to the shipping interest, which has been largely benefited by the forewarnings of approaching storms, given at the chief ocean and lake ports. We have frequently called attention to the great benefit agriculture and kindred industries might derive from similar forewarnings, and are therefore pleased to learn by a telegram from Washington last Saturday, that the first step has just been taken in this direction. The Texan "northers" have frequently proved exceedingly destructive to the flocks and herds of the Lone Star State, and General Hazen, the new Chief of the Signal Service, has given instructions, we are told, to have the approach of these storms telegraphed in time for the shepherds and herdsmen to take measures for the protection of their charge. How this is to be done with herds and flocks scattered over the prairies or wide ranges is not any plainer than how forewarnings are to be sent to those regions. The important point, however, is that the first step has been taken in rendering the Signal Service of advantage to those who make a livelihood by land, as well as to those who make fortunes by sea.

STOCK-RAISING OR AGRICULTURE—WHICH?—A measure is to be introduced into Congress giving 650 acres of the public land to any person who will sink an artesian well on the Great Western Plains, and thus secure a permanent supply of water. The cost of such work would render it impossible for the ordinary agricultural settler on the frontier to accomplish it, whereas stockmen desirous of extending their ranges would find the outlay an excellent investment, and by sinking wells in the names of their hands, they might soon seize upon all the most eligible localities. Already there is much complaint by small farmers along the frontier that the wealthy stock-owners are monopolizing all the springs and water-courses on the plains by a somewhat similar trick, and should this measure be adopted doubtless such complaints will be louder and more numerous. Stockmen, however, claim that the plains between the 100th meridian and the Rocky Mountains are unfit for tillage and suitable only for grazing. This question should be promptly investigated, and should it turn out that that vast, but at present arid, region is fit only for pasturage, it would be wise in the government to favor the above plan as likely to foster the great cattle interests of our Western territories.

ROOT-PRUNING VS. SHALLOW CULTURE FOR CORN.

Dr. Sturtevant, in a late N. Y. Tribune, speaks of the yield of corn of Mr. Bowditch, of Massachusetts, and how it was produced. On 17¼ acres of land he raised 100 bushels per acre. The land was in "fair—not high condition." It received for dressing 123 bags (200 pounds each) of "corn manure," or about 8 bags per acre. "After the plants were from one-and-a-half to two feet high, the cultivator was used—one of those which straddle the rows and whose discs cut deeply and lift the soil." It was "run frequently and as close to the plants as was possible and as deep as it would go." By such means the plant, whenever it obtained a rampant growth, was at once checked by the severe 'root-pruning,' and reminded, so to speak, that its purpose was to grow grain and not leaf.

Dr. Sturtevant concludes that this root-pruning was one of the secrets of the large crop. He cites as evidence that a neighbor (in friendly rivalry) used more manure and planted a smaller field; using greater labor in hand work and ignoring root-pruning. But he secured but "78½ bushels of crop."

At the RURAL's farm we raised, as has been shown, over 150 bushels of shelled corn on one acre, with but 350 pounds of "corn manure" in one instance, and over 130 in another, with 500 pounds of concentrated fertilizer. The cultivation was confined as nearly as possible *to the surface*. The plants were in no case reminded that their "purpose was to grow grain and not leaf."

Now, a neighbor upon a field but one field removed from us, used 1,200 pounds of special fertilizer broadcast, besides a small quantity in each hill, and used the sort of cultivator which Dr. Sturtevant describes, viz., one which "straddles the rows and whose discs cut deeply and lift the soil." His crop, as we have ascertained within the last few days, was between 75 and 80 bushels per acre on three-and-a-half acres. Is not our evidence, as given above, as forcible against "root-pruning" as Dr. Sturtevant's is in its favor?

THE WORLD'S FAIR.

In view of the unanimous election of General Grant to the presidency of the World's Fair Commission, and the promptness with which subscriptions are being handed in, we may confidently look for a successful Exhibition in 1883. Though the time for preparation is short and the work to be done is great, yet, we have no doubt but that, with zeal and persistence in pushing on the work, it may be all accomplished in due time.

Large sums of money have already been subscribed, but most of it conditionally. It seems as if the capitalists of the city and country should come out fearlessly and give a certain amount positively, not hypothetically, and thus the lingering doubt as to whether there is to be sufficient financial support may be removed. Mr. Vanderbilt promises $250,000 provided $4,000,000 are raised, and others agree to give $10,000 if two hundred similar subscriptions can be secured. If these $4,000,000 are not raised within three months it will be wisdom on the part of the commissioners if they postpone the time for holding the Exhibition a year or two.

But $4,000,000 will be far from sufficient to complete the work; it will be simply enough to insure a beginning. At least $10,000,000, and perhaps $12,000,000 will be expended by the Committee before the close of the Exhibition. Considering the fact that the receipts, after the Fair is opened, will defray the expenses in part, that should not prevent a hearty response to the present call for funds.

A failure to carry out the proposed plans for the Exhibition where success depends almost solely on financial considerations, would justly invite the sarcastic sneers of our foreign friends, and be somewhat humiliating to us as a nation on whom the sun of prosperity is shining in full effulgence; but we believe that our capitalists and the people at large have the good name and the best interests of the country too much at heart too allow any such issue of affairs.

With regard to the proposed site at Inwood, there are some objections, but not more than would be connected with any other site in the vicinity of the city, and many of these objections may be removed or greatly modified if no time is lost in the preparatory work.

A GIGANTIC MONOPOLY.

During the past week the commercial world, which from necessity largely patronizes the telegraph, has been greatly disturbed by the announcement that the Western Union, American Union and Atlantic and Pacific telegraph companies have formed a scheme of consolidation on the basis of a largely increased nominal capital. The present capital by which these companies are represented is much greater than the actual outlay made by them, and the projected increase will certainly entail higher rates in order to earn dividends on the floating capital, while the gigantic monopoly of the telegraphic facilities of the country will enable its managers to levy whatever tax they please on the public at large who may find it necessary to use the wires. A project is on foot for the formation of another telegraphic company so organized as to prevent its being absorbed by, or consolidated with, any other company; but even if such a company is formed it will be years before its lines are so extended as to be of benefit to the general public, as its rival will certainly obstruct it in every way.

Legislation, State or national, should promptly protect the public welfare from the odious tyranny and exactions of this and other huge monopolies. Already the prospective consolidation of the three chief lines in the country has strengthened the feeling in Congress in favor of adopting the postal telegraph system under control of the government, and it is reported that several bills providing for its establishment will be introduced into the House to-day. Although we are strongly opposed to the meddling of the government in undertakings that should be carried on by private enterprise, still the protection of the citizen against his foes is the chief end of all governments, and the most formidable enemies of the American citizen to-day are the monopolies that are constantly extending their baneful influence. If it is necessary therefore in order to protect the public from the exactions of monopolies that the government should take control not only of the telegraphs of the country, as in England, but also of its railroads, as in France, we shall heartily support the measure; for the best interests of the public are ours.

BREVITIES.

LADY Apples are now selling for $5.50 per barrel.

THE announcements of seedsmen, nurserymen, etc., may from now on be looked for in our advertising columns.

All subscriptions received after this date, will be placed on our lists to receive the Rural New-Yorker one year, counting from the date when the subscription is received. We have no back numbers.

WE receive some compliments that we value more than others. Here is one from Prof. E. W. Stewart: "I am glad to see strong evidence of your prosperity. Your paper is an honor to journalism."

OUR respected contributor, B. F. Johnson, of Illinois, writes:—"I have seen some large specimens of corn, but the ear of Chester Mammoth you gave us a cut of in the Corn Number is ahead of anything I have ever seen."

A CITRON was brought to the office by Mr. E. Williams who received it from Florida, measuring 7x12 inches in diameter. It is said to be the largest citron on record. The weight is ten pounds.

LET the 18th session of the American Pomological Society be the grandest thing of the kind ever held. President Wilder, as we have already announced, appoints the 14th of next September as the day—and Boston as the place.

THERE is a Yellow Calla Lily (Richardia hastata), a colored plate of which is figured in a recent London Garden. Although introduced into England 23 years ago it is yet quite rare, the stock being held by Hooper & Co. of Covent Garden, who are now sending it out.

WE understand that Ex-Governor Furnas, of Nebraska, is being strongly supported as the successor of Gen Le Duc at the head of the Agricultural Department, should the latter, like the heads of the other Departments, go out of office on the accession of the next President. A better man for the position could scarcely be named.

WE see a marked difference now from an advertisement in the RURAL, as compared with four or five years ago. The letters from our advertisers are more than double, which is the best proof we can get that the paper has a good circulation with a good class of people.

Ft. Atkinson, Wis. CORNISH & CURTIS.

A BOY, a visitor at the late Fat Stock Show in Chicago, on returning home was asked to describe in his own words some of those wonderful fat steers of Mr. Gillett, of which the newspapers had so much to say. He hesitated a while, and then said:—"Gillett's red steers looked more like a street car, with a head and a tail to it, than anything else I can think of."

EUROTAS'S yield of 778 pounds of butter a year, or about 15 pounds per week the year round, does not seem to gain a hearty credit across the Atlantic, to judge by the remarks thereon in our English exchanges. Well, we have a few doubting Thomases here at home; and faith in wonders naturally grows less with distance of place as well as of time.

How accounts do differ! The official report of the French Government places the yield of wheat in France for '80 at 279,200,000 bushels, and the average yield at 32 bushels per acre. Moreover, it is stated that for the past 10 years the average yield has been 31.3 bushels, and the average annual production 267,933,600 bushels, while the country has for the last decade imported 34,110,400 bushels, making the average annual requirement 302,044,000 bushels. English authorities have been putting the average yield of wheat in France at 15 bushels, whereas it thus appears it is greater than the English yield.

MANY singular discoveries have been made among manufacturers by the census enumerators in the course of their investigations. For instance, it has long been known that dealers are in the habit of adulterating honey with glucose on the plea of thus improving its keeping qualities. In Boston, however, there is a firm doing a large business in making honey entirely from glucose much in the same way as manufacturers elsewhere make butter from suine and oleomargarine. The comb is molded out of paraffine in excellent imitation of the work of bees; then the cells are filled with pure glucose and sealed by passing a hot iron over them, and the product is sent to Europe as our best clover honey. The busiest Italian bees couldn't compete with this firm in turning out honey, any more than could a Eurotas-like Jersey breed compete in butter making with our deft manipulators of lard and tallow.

DURING the week an effort is to be made in the House of Representatives to pass a bill giving to the head of the Department of Agriculture a seat in the Cabinet. The RURAL NEW-YORKER has been, for years, an earnest advocate of such a measure, confident that good results to the agricultural interests of the country must accrue from its adoption. We have in the past so frequently advocated the measure, that we shall confine ourselves here to wishing success to the approaching attempt to secure its passage. The present Congress will come to an end in a few weeks, without having hitherto greatly distinguished itself by the wisdom of its legislation; but should it raise the Department of Agriculture to the dignity due to the vast interests it represents, it will have done much to make up for its legislative shortcomings. That the elevation of the Department of Agriculture to the level of the other Departments is only a question of time—at most of a few months—seems to be generally conceded, and if the present Democratic Congress fails to reap the credit of passing the measure, the next Republican Congress is pretty sure to do so, thus bespeaking the good will and support of the vast agricultural community.

ARE we not in danger of having too many agricultural societies of national scope. Last year the American Agl Association which was to take charge of the agricultural interests of the nation, was founded in this city with much *eclat;* the other day the National Farmers' Alliance, which is to cover the same ground, and branch out a little into politics, was started in Chicago by an enterprising local paper; and last Wednesday a dozen or so highly respectable gentlemen assembled at Washington and revived the old United States Agricultural Society, which was founded 20 years ago, or so, to take charge of the farmers' interests everywhere in the Union. This venerable society, however, with the wisdom of age, passed two excellent resolutions:—First, it resolved that its congratulations should be conveyed to the Hon. Marshall P. Wilder, "the founder and friend" of the Society; and, second, it resolved that the question of its consolidation with the A. A. A., should be referred to the President and Secretary with full power to act as they might deem proper. One vigorous society would, in our opinion, be of more benefit to the farmers of the country than a trio of semi moribund ones. Can any of these societies do more for the farmer than the Grange has done; or is any of them more capable of benefiting him, socially, educationally or politically?

(Continued from page 55.)

This langnagc occurs on the first page of the above-named Executive documeut. Following it are the circular letters quoted above. Out of 2 447 (the number of counties composing all the States and Territories of the U. S. at that time), returns from 1,125 were received, from which a tabnlar statement of losses for the year was compiled. This statement may be found on page three of Executive Document No. 35, and is the more valnable because of its being the first statement ever made relating to the annual losses of farm animals by disease. The 1,125 counties reported the following losses for the year 1877:

No. of hogs raised	18,987,342
No. affected with various diseases	2,599,543
Proportion of those attacked that died	.5889
Money value of losses among swine	$10,091,483
Money value of all other classes of farm animals annually lost by disease	$6,561,945
Total value of annua! losses of all classes of domestic animals	$16,653,428

Again (quoting from the Commissioner's letter of transmittal, page three of the same document), we find him using the following language:

"Our wide extent of country and its great diversity of temperature and variation of climate, the severity of frosts in some sections, and the intensity of heat in other localities, render farm stock liable to the attacks and ravages of almost every disease known in the history of domestic animals. * * * * This interest is too great to be longer neglected by the general government. Not only the health of its citizens, but one of the greatest sources of our wealth demands that it should furnish the means for a most searching and thorough investigation into the causes of all diseases affecting live stock."

And now as to the character of this Senate Executive Document No. 35, 2d Session, Forty-fifth Congress. It is a volume of 150 pages of closely printed type, and contains all the letters of any importance received from nearly 1200 practical farmers in all sections of the country. Of the information contained in these letters the Commissioner says that, if heeded by the farmers and stock growers of the country, "it will result in a better sanitary condition, and a consequent diminution of disease among all classes of domesticated animals." As but a small edition of this work was issued by the Senate. Gen. Le Duc considered it of sufficient importance to reprint the more important portions of it, together with much valnable information received subsequently, in the annual Report of the Department for 1877. As 300,000 copies of this work were published, no editor of an agricultural journal should plead ignorance in regard to what it contains.

First Official Notice of Pleuro-Pneumonia.

Among other things contained in this Executive Document No. 35, are several letters giving information as to the prevalence of the disease known as pleuro-pneumonia of cattle. This was the first information of an official character published in relation to the existence of this disease among our cattle, and it not only attracted the attention of our own people but alarmed foreign governments, some of which at once commenced an investigation through agents sent to this country for the purpose. The Agricultural Committee of both the Senate and House of Representatives began to see the importance of some action on the part of the general government, and on the 14th day of February, 1879, after American cattle had been scheduled by the British Government, the Senate asked for additional information on the subject. As General Le Duc's letter of transmittal, which may be found commencing on page 219 of Special Report No. 12 of his Department, and of which 115,000 copies were printed in accordance with a special Act of Congress providing for the same, was one of the most valuable works ever issued by the government, our excellent contemporary should not be ignorant of its contents. The letter is addressed to Hon. A. S. Paddock, the then Chairman of the Senate Committee on Agriculture. It would fill scarcely less than three pages of this journal, so that its publication here is out of the question.

The evidence it offers, however, would seem to be sufficient to disprove the unwarranted and unjust assertion of the editor of the Ohio Farmer that Gen LeDuc gave no public proof of knowledge of the existence of contagious pleuro-pneumonia among our cattle, but we have something to offer in rebuttal of the declaration that he did not comprehend the "magnitude and dangerous character" of the disease "till private, State and national enterprise had definitely marked and mapped out the territory" over which it prevailed and "hemmed it in."

Commissioner Le Duc Ahead.

In August last the Department issued its Special Report No. 22, being one of a series of Reports relating solely to an investigation of diseases of domesticated animals. One hundred thousand copies of this report were also printed by Special Act of Congress, but the information it contains was regarded as of sufficient importance to be embodied in the annual Report of the Department for the year 1879. As this gives an edition of 400,000 copies, surely no editor of a leading agricultural journal ought to plead ignorance of its contents. This Special Report, No. 22, contains all the information attainable up to the time it went to press touching the progress of measures for the eradication of pleuro-pneumonia in the States where it exists. As no "national" action has as yet been taken by the government for the suppression of the disease, one can see what truth there is in the statement that Gen. LeDuc took no action "*till* private, State and *national* enterprise had definitely marked and mapped the territory and hemmed it in."

Bear in mind that Gen. LeDuc's investigations commenced in August, 1877, and that in the month of February following he forwarded to Congress a communication informing that body that this dreaded disease of contagious pleuro-pneumonia existed at several points in the United States. He not only furnished this information to Congress at that time, but he followed it up by urging in the strongest possible language immediate action upon the part of the General Government. At that time not one of the infected States had a law on the subject. It was not until April 15, 1878, that the State of New York passed a law for the suppression of the disease, and no measures for the enforcement of this were attempted until Feb. 12, 1879. New Jersey passed a law on the subject on March 13, 1879; Pennsylvania, on May 1, 1879, and Maryland in the Winter of 1880. For the text of the laws of some of these States, and the progress of the measures for the suppression of the malady, the reader is referred to Special Report No. 22, Department of Agriculture, pages 152 to 163 inclusive, and the Annual Report of Department of Agriculture for 1879, pages 446 to 455 inclusive. If the editor of the Ohio Farmer has not these volumes in his library, he of course, is well aware he can procure them by writing to the Commissioner of Agriculture. On page 163 of Special Report No. 22 commences the report of Dr. Chas. P. Lyman, who visited, under the direction of the Commissioner, the localities where the disease prevailed at that time, and he is the only one who has thus far "mapped out" the infected districts.

EXTENDING THE FERTILIZER TRADE.

MR. L. L. CROCKER has put up large and extensive works at Indianapolis, filled up with the latest and most improved machinery for drying and handling animal matter for his fertilizer works in Buffalo, N. Y. He has made contracts to last during the next three years for the products of over 1,500,000 hogs every year from Bloomington and Peoria, Ill., Louisville, Ky., Indianapolis, Ind., and several other points. The general advance in the material used in the making of commercial fertilizers the present season over the prices last year is from five to six dollars per ton. By this enterprise Mr. Crocker will be enabled to put his fertilizers on the market at the same price as last season, and at the same time retain fully as high an analysis and their former value. At Bloomington, Peoria and Louisville, the firm has in full operation steam presses for extracting the moisture and grease, after which the tankage is forwarded to Indianapolis to undergo the final treatment in the driers. Mr. Crocker has lately contracted with Eastern buyers for 500 tons of ammoniacal matter at $60 per ton, delivered in New York. This will show the great advance in this material. The advance in everything entering into the manufacture of commercial fertilizers has been very great, excepting only South Carolina and other rock phosphates. While enterprises of this sort contribute largely to the prosperity of the firm that undertakes them, they are also of decided advantage to the public, inasmuch as they enable the manufacturers to place upon the market within reach of all who may need them, strictly first-class goods at reasonable prices. One of the greatest evils the farmer has to encounter, is the sudden fluctuations in the prices of the goods he has to buy, due mainly to speculative movements on the part of dealers or manufacturers, and it is a decided benefit to the agricultural community that his present enterprise will enable Mr. Crocker to supply them "with a first-rate article at a steady price. The Honest Fertilizers" must have a greatly increased sale during the current year. W. H. K.

"Of Making Books there is no End."

During the year 1880 the American Book Exchange alone manufactured in their binderies nearly 750,000 volumes and put into type and electrotyped about 40,000 pages of new books. As many as 300 pages, containing nearly half a million printer's "ems," went into type in a single day. The cash sales for the year foot up to $414,248.15. Surely Americans *must* be a reading people.

B. S. WILLIAMS & Co., Kalamazoo, Mich., have just received an order from South Africa for five Stover Wind-Mills. They have also lately made several shipments to South America and their foreign trade is rapidly increasing.

Literary Miscellany.

DEATH OF THE OLD YEAR.

ALFRED TENNYSON.

FULL knee deep lies the winter snow,
And the winter winds are wearily sighing.
Toll ye the church bell sad and slow,
And tread softly and speak low,
For the old year lies a dying.
Old year, you must not die;
You came to us so readily,
You lived with us so steadily,
Old year, you shall not die.

He lieth still; he doth not move;
He will not see the dawn of day;
He hath no other life above.
He gave me a friend and a true, true-love,
And the old year will take em away.
Old year, you must not go;
So long as you have been with us,
Such joy as you have seen with us,
Old year, you shall not go.

He frothed his bumpers to the brim;
A jollier year we shall not see
But though his eyes are waxing dim,
And though his foes speak ill of him,
He was a friend to me.
Old year, you shall not die;
We did so laugh and cry with you.
I've half a mind to die with you,
Old year, you must not die.

He was full of joke and jest,
But all his merry quips are o'er,
To see him die across the waste,
His son and heir doth ride post haste,
But he'll be dead before.
Every one for his own,
The night is starry and cold, my friend,
The new year blithe and bold, my friend,
Come to take up his own.

How hard he breathes!
I heard just now the crowing cock,
The cricket chirps; the light burns low;
'Tis nearly twelve o'clock.
Shake hands before you die,
Old year we'll dearly rue for you;
What is it we can do for you?
Speak out before you die.

His face is growing sharp and thin,
Alack! our friend is gone.
Close up his eyes, tie up his chin;
Step from the corpse, and let him in
That standeth there alone,
And waiteth at the door.
There's a new foot on the floor, my friend,
And a new face at the door, my friend.
A new face at the door.

INMATES OF LESTER HALL.

(Continued from page 26.)

CHAPTER XXXIII.

"And she?" said Sister Monica, eagerly, her fair face flushing as she leaned forward.

"She? She laughed him to scorn!" he laughed bitterly.

"Ah! cruel! how could she? how dared she?" said the gentle nun, clasping her hands eagerly. "It was very wrong."

"There was one excuse for her," he said, hurriedly. She had a brother, whom she loved dearly, and he had been led astray by the brother of this man who loved her; he died a broken down ruined man, and she vowed to revenge his death. To keep this vow, she won the doctor's love -to avenge her brother's death, she scorned it!"

"It was cruelly unjust!" said the nun, gravely.

"No, no!" he said, quickly. He could not hear Cecil blamed. "She thought that he, the doctor, was the guilty man who had ruined her brother."

"Did he not undeceive her?" asked the nun.

"Chance did afterwards," he answered, wearily. "Perhaps I ought not to say chance to you, my sister; and she, in her nobility, wrote to the man who had loved her so madly, and asked his forgiveness."

"And he?"

"He forgave her," he answered, feebly. "He had no room for anger in his heart against her, it was too full of love——"

"Well, and then?" said Sister Monica, with her bright, eager eyes full of tears at his pathetic words.

"When she wrote to him," said Lawrence, his face contracting with pain, "she was the promised wife of another."

Sister Monica uttered a little broken exclamation, and there was a silence.

"That is not quite all," he continued, in a moment. "It so happened that they met again; they were staying together at the same house, and the man whose wife she was to be was there also. They met daily, although they had but little intercourse with each other. How that madman suffered when he saw her with the man to whom she had given a right to love her, and who had permission to touch her hand, her cheek, her lips! One night she came to him and they were alone, and she told him that, betrothed to another though she was, she loved him—loved the man whom she had scorned—loved him with her whole life and being! Can you guess what the temptation to him was then? He resisted it fiercely, and rejected that love, refusing even to touch her hand—because, poor fellow! he dared not. Was it not another's?"

"That was very noble of him," said the nun, gently. "Well?"

"They never met again; the doctor came abroad; he dared not trust himself to look upon her face again."

"And she? Is she married?"

"I do not know. The day was fixed for the wedding, but she was taken ill—not dangerously, but sufficiently to prevent any marriage taking place."

He closed his eyes wearily, and Sister Monica said no more, but when she next glanced at his face large drops of water were shining on the long eyelashes, and rolling down the hollow cheeks; and as she left him, going to prostrate herself before the altar in the little chapel, and while she prayed that the dark shadow might be lifted from Lawrence Carewe's life, there mingled with her prayers a chord of thanksgiving for the calm and peace of her own existence.

CHAPTER XXXIV.

A STRANGE RETURNING.

Sorrow rarely kills. It is wonderful how much this frail humanity of ours can bear without sinking under the burden which at first threatened to overwhelm us. At first, when the trouble comes, it seems as if we should never know joy or peace again—as if for us the sun was darkened, the earth had lost its beauty, the flowers their fragrance; but by-and-by we lift up our heads again. Much has been taken from us, but much has been left, and we discover that

"Life has more things to dwell on
Than just one useless pain!"

And we go about our usual tasks, and resume our usual occupations, heavily indeed, it may be, but even the effort is beneficial to us."

The shock of Lawrence Carewe's terrible death did not kill Cecil Lester, although those who loved her at first feared that it would do so; but when she first left her room after the nervous illness which prostrated her for a time, those around her were surprised how well "she bore it." She neither wept nor wailed: no word of lamentation or moaning escaped her lips. She was very quiet indeed, but more gentle, more patient, than she had ever been before. Thus she was outwardly; it was when she was alone that she suffered an inconceivable anguish.

During the day she tried hard to be calm and composed—she drove out with Mattie, saw a few visitors, who accounted for her altered looks by her late illness, and who never dreamed that the illness was caused by the announcement, which some few had noticed, of Dr. Carewe's death in the East. She was never idle; she tried to read, she tried to work, she tried to practice, with a feverish desire for occupation, but she could fix her attention on one subject but for a short time; she grew dreadfully restless, and grew thin to emaciation, pale and haggard.

I think what saved her reason, if not her life, was a faint glimmer of hope which lay deep in the inmost recesses of her heart—unconfessed even to herself, but living. There might have been some mistake—a case of mistaken identity, perhaps; such things had happened ere now. And there never came a knock at the hall door—a carriage never stopped before the house—but Cecil started to her feet with a sudden eager, hungry light in her eyes, and a wild hope in her heart, that when the door opened she would see the tall proud figure, and the grave, gray eyes she loved so well. It went to Mattie's heart to see how despairing the great eyes would look when the hope proved as it always did—fallacious.

Once, seeing the effect this endless excitement was having upon her health, Mattie gently remonstrated with her. They were sitting together in the boudoir, where they had spent so many happy hours during their girlhood, and Mattie had her baby in her arms, and made as pretty a picture in her dainty motherhood as eye could wish to see. They had been silent for some moments, and Cecil was watching her sister with sad, tender eyes, and a little smile on her lips, the book she had been reading lying unheeded on her lap, when suddenly there came a peal at the bell which rang through the house; and Mattie saw how her sister started, and pressed her little hands to her heart, and bent her head forward to listen, and then, when a servant came in with some trifling message, how she sank back wearily on her cushions, white and still, exhausted by the agitation she had undergone.

"Cecil, dear," Mattie said softly, speaking in an undertone out of consideration for the sleeping child on her lap, "do you know that you make us very unhappy?"

"Unhappy!" said the voice; "I am sorry, dear. How?"

"Cecil, do you not think," Mattie replied, answering one question by another, "that it would be wiser to give up hoping as you do? Dear, if he lived, do you suppose we should not have heard it ere this?"

It was the first time she had ever mentioned the subject, and Mattie's voice was very unsteady as she spoke.

"Do you think that I hope, Mattie?" Cecil said, wearily. "Do you think that I dare hope—and yet—oh! Mattie!" a sudden passion breaking up the stony calm of her face, "if I did not, I should die!"

She rose from her seat and knelt down by Mattie's side, speaking in a low, hurried tone of anguish.

"I do not hope," she said, faintly. "I know how vain such a hope would be—but sometimes I cannot help thinking I shall see him again—such strange things happen! We have known it, have we not, dear, that people have come back from wars, from captivity, so many years after, that their own relatives did not know them?"

"But not from death, Cecil!" said Mattie, her eyes filling with tears; and Cecil's head sank until it rested on her sister's knee.

"Think how hard it is for me, Mattie," she said, in a moment. "I loved him so passionately, and he never know it! When I told him so, passionately, he never knew it! When I told him so, he did not believe me. We never had even one happy day together! If I could have seen him once—if I could have heard him say he forgave me—if I could have been with him when he died, I should not have felt it so hard, but as it is, Mattie, I cannot bear it!"

She flung herself away from Mattie and on the rug, lying there on her hands for some minutes; while Mattie sat silent, powerless to console, powerless to help, with tears running down her cheeks, and falling on the baby's dimpled hands.

"It is not often I make such a moan," Cecil said after a pause, raising herself from the ground, and pushing back her hair wearily from her brow. "Forgive me, dear!"

"Dear Cecil," said Mattie, gently, "you are so brave and patient, it makes us love you all the more, and grieve all the more, that you should let yourself hope at all.

"When my hope—if hope you can call it—dies, I shall die too! Oh! Mattie, how strong I must be! Do you remember how ill I was in the Spring, and how I recovered? Nothing seems to kill me," she went on wearily, with a little sorrowful smile. "Other women would die under the trouble—under half the trouble which I have borne, and live!"

"We cannot spare you, darling," murmured Mattie, softly. "What would Uncle Henry do without you? You are the light of his eyes, Cecil!"

"Poor dear uncle! Such a dim light now!" she said, smiling, and took up her book again and began to read.

There was some minutes' silence, then Cecil looked up with a smile.

CHAPTER XXXV.

"You are fond of poetry, Mattie," said Cecil. "Shall I read you something I found in this book of poetical selections Edgar brought you the other day?"

"If it will not tire you, dear," said Mattie, gently.

"It is called 'Returned'—'Missing,'" said Cecil. "And underneath, in parentheses, are the words, 'Five years after.'"

"Do you think you had better read them?" said Mattie, looking a little alarmed at the title. "They may upset you, Cecil, dear."

Cecil shook her head.

"I should like to read them to you, dear," she said, and without more ado she began, in her soft, pathetic voice, two stanzas of which were as follows—:

"Yes, I was sad and anxious,
But now, dear I am gay;
I know that it is wisest
To put all hope away.
Thank heav'n that I have done so,
And can be calm to-day!
* * * * * * * *
"Not that I dream or fancy
You know all that is past;
Earth has no hope to give me,
And yet—time flies so fast
That all but the impossible
Might be brought back at last!"

"All but the impossible!" said Cecil, softly. "Is that impossible, Mattie?"

There was a silence, broken at last by the entrance of a servant, who came to replenish the fire and to inform Mattie that Mr. Eleston was in the drawing-room, and wished to see her or Miss Lester.

Cecil looked up eagerly.

"Ask him to come up here, Jenkins," she said, quickly. "Mattie, don't send baby away—Ernest will like to see it."

Ernest entered the room with some embarrassment; it was the first time he and Cecil had met since that stormy interview occasioned by the breaking off of their engagement, and he looked a little pale and nervous as he shook hands with Mattie first, and then turned to Cecil, who gave him her hand with a little smile, which Ernest could not return, he was so shocked and startled by her altered appearance.

"You have been ill," he said, helplessly. "You have been very ill?"

"Yes, I have been ill," she said, smiling. "But I am better now; much better—almost quite well—and I am very glad to see you. When did you return?"

"Only this week; I heard you were in town, and"—looking at her deprecatingly—"I thought I might come."

"It was very good of you to come," she said, gently. "We have heard of you sometimes indirectly, she added, with a smile, and Ernest colored slightly under his sunburn, and turning to Mattie said something complimentary about the baby; and while the young mother smiled and answered, Cecil sat dreamily looking into the fire

"Have you brought no news?" she said, abruptly. "No, of course you could not, I forgot. Will you have some tea, Ernest?"

"I am going to take baby to his nurse," said Mattie, rising. "I will tell them to bring some Cecil. Ernest likes afternoon tea, I remember of old."

Mattie went away. Ernest having closed the door looked down at the wan face of the woman who was to have been his wife.

"Why do you look at me so sorrowfully?" she said, smiling. "Do you think I look very ill? Do you think I am going to die?"

"Cecil," he exclaimed, in a voice of pain; then conquering his agitation, he sat down beside her.

"What has been the matter with you? Have you had advice?" he said, a little huskily.

"Advice! what for? I have not been ill for some time now," she answered.

"Not been ill—not ill! Good Heavens, Cecil, look at your hand."

"Do you think that illness alone could make it so thin?" she said, sadly. "Did you ever hear of a great trouble killing one? Oh, I hope—I hope—I pray that my trouble will kill me."

"Cecil!" he exclaimed.

"Do you remember that last time we met?" she said. "I told you then that I had given away my heart to a man who cared little for the gift. But I loved him, and he is dead."

"Dead!" he repeated. "Poor Cecil! Poor child!"

"I only tell you this, that you should not worry yourself or me with suggestions about my health," she said, hastily; "we will not talk any more about it. Tell me about yourself; you returned home this week, you say? Have the Tyrrell's returned?"

"No, but they return shortly," he said, hastily. "Cecil, have you forgiven me for my brutal conduct to you when——"

"Nay, you were quite right," she said, gently, "I deserved every word of reproach you gave me, Ernest. But we will not talk of that now," she went on. "You have quite forgiven me, Ernest, have you not?"

"It was I who needed forgiveness," he said, brokenly. "I was never worthy of you, but I loved you, Cecil, you know that?"

"Yes," she said, sadly. "But all that is over, you know. I want to hear all about yourself and ——and Lottie."

The handsome, sunburnt face flushed slightly.

"About myself," he answered, with a slight degree of embarrassment (it is not a very pleasant thing to tell one woman to whom you were once betrothed, of your engagement to another,) "there is but little to tell. I have been traveling about you know. At first I was very miserable, Cecil, but by-and-by I got over it."

"Well," she said, smiling.

"Well, then I fell in with the Tyrrells, and the General gave me permission to join their party and—it was very pleasant," he concluded, lamely.

"Very pleasant," said Cecil, with her soft, sad smile. "Is that all?"

"Not quite," he answered, coloring and smiling, "Well, Lottie and I saw a good deal of each other, and ——"

"And you made up your minds you could never see too much of each other?" said Cecil. "Ernest, I am so glad. She is one of the sweetest, truest girls I ever knew. You are a very fortunate man to have won her."

Ernest's face flushed, and he required but little encouragement to become eloquent on the subject of his new happiness.

"Do you remember last year at this time, when we were at Mrs. Brayburn's?" he said eagerly; "you thought Lottie had a fancy for Dr. Carewe; but she says she always cared for me even then. By-the-way, what a shocking thing that dreadful death of his was."

"Yes," said Cecil, calmly, although her very lips paled at the careless mention of his name; and before Ernest could speak again, Mattie entered the room.

(Conclusion next week.)

THE EYE-OPENER.

Now for the names of the "parties" outside New York City, to whom the Post Office refuses to deliver letters or money orders on account of the more than doubtful honesty of their mode of conducting business—and first for the New England sharpers:—Boston shelters L. A. Kendall; alias L. A. Ashman; alias Bay State Organ Co.; alias Eastern Gun Works; alias Enterprise Publishing Co.; alias Home Delight Co.; alias Hub Manufacturing Co.; alias Hub Watch Co.; alias Inventors' and Manufacturers' Association; alias Japanese Curiosity Co.; alias New England Scientific Works; alias New England Manufacturing Co.; alias Paris Art Co.; alias Parisian Photograph Co.; alias People's Paper Publishing Co; alias The Welcome Guest. Kendall, you see, has a multitude of irons in the fire with which to burn his patrons. The Paris Novelty Co. has dens at Boston, Mass., Rockland, Mass., and Chicago, Ill. Another firm with many aliases, and hailing from the same three cities, is E. Ellsworth Slocumb; alias Agents' Union; alias American Book Co.; alias E. G. Cramco; alias Eels & Co.; alias Royal Piano Co; alias D. P. Eels & Co.; alias Solar Watch Co.; alias Solar Manufacturing Co; alias D. P. Suydam; alias P. W. Williams & Co. After this many-named concern here are a few others, whose spider-webs are set in other parts of Yankeeland:—Edgar W. Jones, Ashland, Mass., and South Framingham, Mass.; alias Harry J. Littleton & Co.; alias Union Purchasing Agency; alias Union Publishing Co.; alias Magnetic Watch Co. Union Publishing Co., Ashland Mass; Union Publishing Agency, South Framingham, Mass.; Harry J. Littleton & Co., Ashland, Mass., and South Framingham, Mass.; Magnetic Watch Co., Ashland, Mass. Ashland, Mass., seems pretty well stocked with doubtful characters—eh? A couple more are left for other places, such as Hugh McKay, alias Hugh McKay & Co., of St. Stephens, New Brunswick, and Calais, Me., and the Magnetic Watch Co., South Framingham, Mass. Other parts of the country will be heard from next week.

MAGAZINES FOR JANUARY.

ST. NICHOLAS.—Contents—Frontispiece, "Firelight Phantoms;" The Wrong Promise, illustrated, "George entertains the baby;" One of his Names, verses; Going Home for the Holidays; The Children's Fan Brigade, illustrated, "Playful," "Majestic wave," "Position for bows," "Fans spread," "Inviting;" Out of Style, verses, illustrated; Stories of Art and Artists; Handel, poem, illustrated; How the Aristocrats Sailed Away; The First Tooth; Fire-light Phantoms, poem, illustrated by the Frontispiece; In Nature's Wonderland, Chapters II. and III., illustrations by H. Faber, "Mrs. Yegua takes leave of her enemies," "Breaking a grizzly;" The 'Thing-a-ma-jig, illustration, "The Thing-a-ma-jig;" "The King of France and Four Thousand Men;" Every Boy His Own Ice Boat; New Year's Day, verses, illustrated, "A Happy New Year to you!" Phaeton Rogers, Chapters III. and IV.; Nedawi, An Indian Story from real life, illustrated; Brier-Rose, poem, illustrated; A Snow Battle; A Dear Little Girl of Nantucket, Jingle, illustrated; New Year's Calls, illustrated; Mystery in a Mansion, Chapters V. and VI.; For Very Little Folk, The Fast Goat Line; Jack-in-the-Pulpit; The Letter-Box; The Riddle-Box.

This, the first of the new year's numbers, is presented in equally as attractive, if not an improved form. The illustrations are stories in themselves, increased in interest by able descriptions.

THE AMERICAN NATURALISTS.—Contents: The Ancient Glaziers of the Rocky mountains; The Discovery of Iron Implements in an Ancient Mine in North Carolina; On the Fertilization of Calamintha nepeta; Comparative Neurology; Botanizing on the Colorado Desert; The Method of Distinguishing Species of Populus and Juglans by the young naked branches; An address to the Fossil Bones in a Private Museum; Editor's tables; Recent Literature; General Notes; Zoology; Entomology; Anthropolgy; Geology and Palæmontology; Geography and Travels; Microscopy; Scientific news; Proceedings of Scientific Societies; Selected Articles in Scientific Serials.

THE DISCOVERY OF IRON IMPLEMENTS IN AN ANCIENT MINE IN NORTH CAROLINA.—In Western North Carolina are found many evidences of prehistoric mining operations, such as open cuts, tunnels, shafts and dumps. The latter are covered with a forest growth of several hundred years and in the excavations has accumulated the debris of centuries.

About ten years ago a new industry was inaugurated in the State, that of mica mining, and strange to say the best and most profitable mines have been those located upon the sites of the "old diggings." In clearing out the ancient works very few implements have been found which throw light upon the original miners. The opinion, now generally held, is, that they belonged to the Mound-builders, whose mounds are also found, but sparingly, in the river basins. That this is, for the most part, correct, I think has been clearly shown by Prof. Kerr in his Report on the Geology of North Carolina for 1875. He there states that he learned in a conversation with Col. Whittlesey, and subsequently from numerous publications on the subject of the mounds of the Northwest, that mica was of common occurrence in the tumuli of the Mound-builders, among the utensils and ornaments which such rude people are in the habit of inhuming with their dead owners. And upon further inquiry, he ascertained that cut forms, similar to those found in the mounds were occasionally discovered among the rubbish and refuse heaps about and in the old pits.—*Frederick W. Simonds, in Am. Naturalist.*

LIPPINCOTT'S MAGAZINE.—Contents: Gigi's: A Cosmopolitan Art School; Titian's Venus; An Old New England Seaport; Lilith, a Story; The Wanderer's Bell, a Poem; Out-door Life on the Rhine; Opposites; The Called Meeting, a Story; Madame De Stael; The Occultation of a Honey-moon, a Story; Race in Brazil; My Mining Investment; Which is Best? Our Monthly Gossip; Literature of the Day.

This number opens a new series at a reduced price, and presents itself in an artistically designed cover that pleases the eye. This favorable impression is more than confirmed by an examination of the contents, which are generally light and of a thoroughly popular character, while marked by a literary excellence of a high order. The illustrations, too, are carefully executed, the new arrangement of the editorial matter cannot fail to prove attractive, and altogether the number is promising.

DEMOREST'S MAGAZINE.—Contents: Marie Antoinette (portrait in oil); Bubbles (steel engraving); Valentine in Oil; Seed-time and Harvest Tapestry; Marie Antoinette; Women of History—Madam Roland; The Higher Education of Women. H. F. R. Some Account of its Progress in Europe and America; Talks with Girls; Small Causes vs. Great Events; Economy; A Revolution; An Easy Place; A Valentine; Heartsease; The Ebb of Love; Two Photographs—A Story of St. Valentine's Day; Song; Sam's Stratagem; I Love You; Josie's Grandmother; Mr. Hayford's Beau-Bake; Kith and Kin; A Valuable Gift; My Housekeeping Class; About Horns—Items; Correspondents' Class; The Spelling Reform; Advice to Girls; Answer to Rebus; Influence of Associates; The Rich Mouse; Window Shade in Mosaic—Knitted Lace—Scrap Basket—Knitted Fringe—Monogram, N. G.—What Women are Doing; Hobbies—Bubbles—Decorative Art in the Household—Miss Alcott's New Story; What We Live For—State Reformatories for Women—Modern Improvements in Business Houses—Kith and Kin; Current Topics; Scientific Items; Kitchen; Answers to Correspondents; Review of New Books, etc.; Good Words—Life Insurance—A Literary Thief—Diamonds of Thought; Spice Box.

The combination of fashion and literary matter, together with the many illustrations, make this a popular and attractive periodical.

ECLECTIC MAGAZINE.—Contents: Steel Engraving—"Marguerite," after the painting by Bertrand; The Sabbath, An Address; Lady Hester Stanhope, the "Queen of Lebanon;" Some Strangely Fulfilled Dreams; Animal Instinct in its Relation to the Mind of Man (The Unity of Nature, No. III.); Social Life among the Ancient Greeks; A Letter from Newport; Decorative Decorations; Fiction—Fair and Foul, IV; Trevelyan's "Early History of Charles James Fox;" Recent Science; Through Siberia by Way of the Amur and the Ussuri; Life and Death, three sonnets; The Mystery of the Pezazi, a Sketch from Ceylon; Plain Speaking, 1, a Little Music; The Bugle, from the French of Paul Dolourede; The Natural History of Dress; The Wages of Literature; Three Wishes; Literary Notices; Foreign Literary Notes; Science and Art; Miscellany.

The frontispiece is a great addition to this issue. The selections are good and the general production equal to former issues.

DEAN STANLEY told a good story recently. He said a minister of one of the younger branches of the Church was calling the attention of a member of the Established Church of Scotland to some of the great abuses in that venerable Church, to which the Scotch minister replied: "When your chimney has smoked as long as ours, perhaps it will have as much soot in it!"

For Women.

CONDUCTED BY MISS RAY CLARK.

THE FAMILY RECORD—AN INCIDENT OF ENUMERATION.

EDGERTON.

"This notched stick, suspended here
Beside the great hall door,
Hides many a quaint and curious page
Of unwrit family lore:
It holds the record of our lives,
Each notch a story tells,
And in its mystic marks and signs
Our family history dwells.

"'Twas not as now, when we were young,
Our schools were precious few,
And also very far between—
Our county numbered two—
And fifteen miles in winter time,
Was rather far to go;
Remembering that the Winters then
Were not devoid of snow.

"And so the schooling we obtained,
(Myself and husband Dick,)
Consisted all in marks and signs
And notches on a stick.
I blush not here to own this fact,
The blame, if blame there be,
Must all attach to circumstance,
And not to Dick and me.

"This preface on the end, we notched
Just sixty years ago,
Where we had built our little hut
And moved in, through the snow;
The worldly wealth we then possessed,
I'll not essay to hide,
Consisted in a yoke of steers,
A log-chain, axe and slide,

"But we were young and hopeful, and
Esteemed our prospects fair,
The richness of our mutual love
Relieving every care;
We dwelt within a little world
All sacredly our own,
Basking in smiles and johnny-cake
Living on love and pone.

"This notch, denotes the day and date
When little Dick was born,
The first of June, in twenty-nine,—
Just fifty years this morn,
Poor boy! he was not with us long,
His sands of life were few!
For here we notched him off again
In April, forty-two.

"With doubtful, trembling hand, I made
This ugly notch myself,
When Daisy married wild Jack Jones,
And moved off to herself;
I had no confidence in Jack,
He'd lived a reckless life,
'Twas only under my protest
That he obtained his wife.

"But Daisy brought about a change,
As good wife ever can,
And Jack has long since settled down
And proved himself a man;
They own five hundred acres of
The very best of land,
And have a genteel balance left
Of ready cash on hand.

"Our cash account, we've always kept
Upon this separate stick—
I make no entries here myself,
But leave it all to Dick.
Each notch a thousand represents,
In all, just sixty-four,
And should the crops prove fair this year,
We'll add about five more.

"We've always kept our business square,
And straighter than a string,
Have fairly dealt with all the world
And owe no man a thing.
We've labored honestly and well,
For every cent we've got,
And old age finds us happy and
Contented with our lot."

CONCERNING SELF-RELIANCE IN GIRLS

MARY WAGER-FISHER.

For Fathers and Mothers to Read.

I THINK I may say, that, as a girl, being mother-orphaned at a tender age, and from the force of other circumstances, I was more self reliant, or grew to be more so, than are the majority of girls. But when my father died—I was then past twenty—I felt as if the earth were swept out from under my feet. I had been liberally educated, had been made familiar with many things, but I knew almost nothing of business. I believe I did not know how to make use of a check or draft without being told. I knew nothing of the management of property, or of property laws. I had an idea that the business of a lawyer was to "fleece" his client, and so I trusted my pecuniary welfare as a great many women do with relatives. In short, I was, after a fashion, my own lawyer. There's an old adage which I illustrated finely. "When a man is his own lawyer, he has a fool for a client." (As I have married a lawyer, it is reasonable to infer that my opinion of the guild has changed since I was a girl.") I suppose I learned something from my ignorance and folly, for it is a strange experience from which one does not reap some benefit. But why should women, from generation to generation go on garnering the bitter fruits of similar folly and ignorance? Why should a girl, any more than a boy, when orphaned; or a wife, any more than a husband when widowed, be helpless and unarmed against the misfortunes, and suffer as they so frequently do from the bountiful "advice" and "kindness" and "management" of male relatives? Simply because they are trained in ignorance of certain things that they should well know, and pre-eminently because they have not been taught habits of self-reliance. I have known a few men, and I have reason to believe that there are many such, who buy every article needed for the family, even to corsets, calicoes, stockings and winter cloakings and the "women folks" have become so accustomed to being "pro-

vided for" even to their pocket handkerchiefs, that they actually dread going to town to shop, or to "trade."

There is such a thing as to fall so far from the grace of moving about in the world, as to live very much like a vegetable—to grow up, or to be planted in a certain spot, and to remain there until nipped by the frost of Death. There are *women* who become just such vegetables from a continued habit of staying at home. It may be comfortable, and it may be easy, for the father and husband to attend to the entire business of the family, but it is a kindness of such texture that sooner or later parts into shreds of a very poor sort.

Some one writing from Mentor not long ago, mentioned having seen Mrs. Garfield standing in her kitchen door, giving directions to the "hands" in regard to the marketing of half a dozen or more barrels of cider. Whether the stated occurrence was true, or not, one feels certain that the wife of the President-elect is fully capable of transacting business intelligently and in a business like way, and no one doubts but that she possesses womanly qualities of a high degree.

I mention this, as some young women pride themselves upon their ignorance and their helplessness. They imagine that to be purely womanly, they must be helpless, and delicate, too. Such persons are not womanly in the true sense! they are simply effeminate. A girl should be taught self-reliance from her infancy, and from an early age should regulate her own expenses so far as it is practicable. If a frock of calico or gingham is to be bought for her, take her to "the store" with you, and let her select it and pay for it herself. Habituate her to expending money carefully and discreetly. By choosing for herself, she learns to decide for herself. It is better that she decide for herself, and make a poor decision a great many times in unimportant things, than grow up to be an undecisive women. The man who wrote "Frailty, thy name is Woman," would have hit the truth more nearly, had he put it "Indecision, *thy* name is Woman." Business men dread to do business with, or for, women, because the latter so rarely know what they want, and are so slow in coming to a decision. They fail to distinguish between important and unimportant matters, and daily as long over the one as the other. This defect in character of many women is by no means innate; it is the result solely of their education and training. They have not been accustomed to decide for themselves, and the narrow scope of their lives, has forced them to regard even trivial matters as important ones. They look as long before they leap in deciding between two pieces of black silk, as in committing matrimony. But then it sometimes happens that husbands are more easily to be had than are silk frocks.

It is always a good training and an essential part of a child's education, to have a bank account, however small. It is not always practicable to give a child a real bank account; but you, yourself may be the banker, receive the small deposits of the child, oblige it to draw out its savings when desired by means of checks, and so far as possible, transact the business as at real banks. Interest may be allowed on the deposits which the child should compute. Of course, the child should be aided as much as possible in making deposits, and in spending the withdrawals judiciously. Care should be taken to inculcate a spirit of generosity, as well as one of frugality, and to teach that money has but one value the use to be made of it. The investment and security of money form a good topic of talk with children, occasionally, and girls especially should be made to understand the meaning of bonds and of mortgages, and the value and requirement of securities.

The custom in France of giving a *dot*, or dowry to a girl when she marries, is a most excellent one. French parents, no matter how poor they are never expect their daughter to marry without a *dot*, and the various members of the family, somehow manage to secure it. Of course, it is often very small—one or two francs maybe—but it is *something*—and it is to belong to the young wife exclusively; is duly invested and secured for her sole use. The custom I am glad to see, is being imitated in this country. A young California lady who was recently married had an income of fifty thousand dollars secured to her; half by her father, and half by her prospective husband. Of course, that was an exceptional case in amount, but the principle is a good one. Every married woman ought to have a certain income which is secured against all probable misfortune, and which no one but herself can control. It ought to be regarded by every father and mother as their duty to see to that their daughter, when she marries, has such an income as it is possible to give to her thoroughly secured to her. It should be made a genuine matter of business, legally arranged, and in no way be left to a matter of sentiment. Sentiment is all right in its way; women are over-much guided by it, but a well-certified legal document is apt to befriend one better in the long run. It is much better to give a daughter a frugal "out-set" and a *dot*, than to make the former sumptuous and the latter altogether lacking. Secure to her an income at all events, I would say, and the man to whom she is to be married should be given the opportunity to contribute to the fund. A wife is worth as much now-a-days as when Abraham sent his servant to bargain for a wife for Isaac. If husbands and fathers were sure of living forever, there would be no need of post-mortem provision for their families. It is not pleasant to talk of death, or to keep the possibility of it ever present to one's mind; but how much trouble might be saved if there was a clear understanding by the elder members of the family as to what would be best to do in the case of the death of a parent—whom to consult, by whose judgment to be guided, what disposition to make of the property, etc. In case of the death of the husband and father, or of the mother—if the only parent—the family then, would not be plunged into such rayless perplexity, not knowing what to do, whither to turn, and in their grief taking the first hand proffered, and living to regret it ever after.

That all people have confidence in their near relatives is right. They should have; the world would be a sorry place without such trust and confidence. But as regards the management and trust of property, there are two reasons why they should not be entrusted with one's relatives. In the first place the business is not conducted in a businesslike way, whereas it should be regulated precisely as it would be with a stranger. In the second place, if the management is bad and money is lost, hard feelings are engendered, and few things are more deplorable than anger between kindred. It is a common remark that if you wish to retain the honest affection of a person, don't put him under pecuniary obligation to yourself; for if he finds himself unable to discharge it, he never thereafter feels comfortable and happy in your presence. It is always better in matters of finance to be guided by the advice of a competent lawyer (not a "pettifogger") than by the gratuitous advice or suggestion of the best and dearest relative in the world, unless the relative chances to be an entirely disinterested party and a person of experience and good judgment in business matters. Even then there is safety in having a good lawyer.

My great aim in referring to this matter at all is to urge upon parents—especially upon husbands and fathers—the necessity of educating their wives and daughters in matters of business, obliging them, so far as they can, to become familiar with the common details of financial transactions, and to have a tolerably clear comprehension of what they could do, and what they should do, in case of necessity, and to urge upon young women the advantage of thinking and acting for themselves.

OLD MAID.—No. 2.

I NEVER read "Twaddle," stuff that women write, about cooking, etc,, but in turning from the Agricultural news to "Inmates of Lester Hall," my eye fell upon a letter which attracted my attention. Since then I have look on with some interest, and as that "Young Bachelor" is about to get the worst of it, I step upon the arena, for my share of—Oh! what shall I call it? No. 2's antipathy or approval? I am older than Bachelor No. 1, I meet ladies with a *frown* and I'm crusty.

I like the ring of No. 2's metal. Give me always and forever a woman who thinks she hates men, and my interest to win her is excited.

OLD BACH. No. 2.

ABOUT WOMEN.

MISS MORSE, the daughter of the inventor of the telegraph, is about to be married to Mr. Rummel, the pianist.

THE DUCHESS OF MARLBOROUGH will send 16 Irish families, with complete farming outfits, to Manitoba, in the Spring.

MRS. ELLEN GRANT SARTORIS has now three children—two little girls and a boy. The fourth—her eldest son—is dead.

ADELINA PATTI is undoubtedly, says Mrs. Hooper, coming to this country next Autumn to remain two years. All arrangements are made, and the contract signed.

MISS SCHOONMAKER, of Kerhoneson, New York, at the age of 24, inherited a large farming property very heavily mortgaged, and had at that time, five helpless people dependent on her. In the 14 years that have since elapsed, she has taught school, managed the farm, going into the field herself out of school hours, has paid off the mortgage, improved the property, and become an extensive stock-raiser.

FASHIONS.

THE skirts of walking-costumes are certainly as a rule, much fuller than they were last Winter although the bodice is quite as clinging as ever.

Bonnet crowns of copper-colored plush are made very effective by amber-beaded appliques.

Silver jewelry is very much a la mode, and shows very effectively with the rich, dark dresses of the season.

Sleeveless polonaises of figured materials over velvet skirts and sleeves form not only very fashionable, but convenient toilets.

Plush is the queen of materials this winter but still many ladies prefer brocaded silks and satins, which not being so thick, are more becoming to all but very slight figures.

Woolen fabrics are innumerable; tartan plaids in dull colors are much worn, mixed with plain materials for ladies, but by themselves for little girls and children. Other woolens, such as cashmere, vigogne, camel's hair, armure, rep, beige, and diagonal, are mostly trimmed with fancy wool and silk brocade, velvet, or plush.

The Marguerite gauntlet sleeve is very fashionable and stylish. The top is made of the material of the dress, and the long cuff which reaches to the elbow is made of plush velvet or satin. The cuff fits closely to the arm, and is buttoned or laced up the back.

As regards colors gray is not much worn this Winter; black toilets are always very *distingue*. The shades most fashionable for dresses are dark greens; garnet, always in favor; violet, very becoming to blondes; lapis-blue, seal-brown, prune, and all shades of deep red; the latest name for copper-red is *tison*, or ember-red.

Fashion is very full of whims and fancies this Winter. Upon fur cloaks, caps, and muffs she has decided to place the paw of some wild beast—lion, tiger, or panther—with gilt claws. In artistic jewelery we see the most fantastic devices—beetles, cockroaches, spiders are the favorites; the latter especially is just now the pet of the season. It is made of gold, silver, diamonds, and every kind of precious stone, and used as eardrops, brooches, charms, and ornaments for hats and bonnets.

Ice water is rendered harmless and more refreshing with Hop Bitters in each draught.

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

GOOD MANNERS AT THE DINNER TABLE.

Good manners, when carefully heeded at home,
Will carry politeness wherever you roam.

Gaze not at a guest, nor at any one's plate,
Nor boorishly hold up your knife and fork straight.

Forbear at the table to mimic the ape,
Nor spread out your limbs in an uncomely shape,

Rest not on your elbows, nor knife and spoon lick,
Nor finger the forelock, nor use a tooth-pick.

Speak never of sickness, nor death of a friend,
Nor nauseous nostrums, till dinner shall end.

Beware, when at home, or abroad, of the fault
Of thrusting *your* knife in the butter or salt,

Smack not with your lips, neither glower around,
Nor swallow your coffee with gurgling sound.

One should never be guilty, wherever one goes,
Of hemming and hawking and blowing the nose.

Raise not an unsavory dish to the nose,
Nor turn it to scan it suspiciously close.

If knife, fork, or spoon chance to fall to the floor,
Defer not to wipe, and unsullied restore.

When butter is furnished with insipid hair,
Remove it, unnoticed, affecting no care.

Cut thin and small slices; but eat with a fork;
And turn from the table when drawing a cork.

The carver, when carving and serving the meat,
Should deem it unskillful to rise from his seat.

When serving the courses, distribute the best
To matrons and sages, or some honored guest.

Let gourmands and gluttons beware of the sin
Of ending *their* courses ere others begin.

Mince not between courses, when you've had enough;
And turn from the table to stifle a cough.

Sip not your hot coffee, nor blow your hot meat,
Nor gulp them untasted, nor surlily eat.

Good manners at dinner forbid one to look
At letters, or papers, or read in a book.

Be cheerful, feel grateful whenever your food
Is wholesome and fragrant, all steaming and good.

When one cannot eat what is dry as a stick,
True etiquette warrants the plea, "I am sick!"

When leaving, untimely, say "Will you excuse?"
Thus honor your manners, nor credit abuse.

Suck not your soup with a bubbling sound,
Nor heedlessly spatter the gravy around.

Encircling the table, *say* something; yet fear
To speak in a whisper what others may hear,

Say something; yet, after another's begun,
Forbear interrupting before he is done.

Say *something*, if naught but "This sugar is sweet,"
Or coffee is fragrant, or juicy the meat. S. E. T.

ONE WEEK FROM MRS. CLAY'S JOURNAL.

ANNIE L. JACK.

FRIDAY.—This morning Janet undertook to give the children's bed-room an extra cleaning while about the regular up-stairs work, so Nora and I did the baking, which, if possible, is done up on Friday to last three or four days. I often think what folly it is for us to be always over the oven and baking board, and there is as much need of economy in that direction as anything else to which we turn our attention. Economy in work means a saving of strength, and the saving effected in this respect means more to spare for mental labor and the development of our children. When Alex. comes to me, as he often does, and says, "Mamma, how do the leaves come?" or, "What makes the leaves fall off?" if I am thinking of him and his naturally inquiring infant mind, I tell him in the simplest language the story of Nature and of Nature's God. But if I am tired with over-work or worry, I very likely say, "Run out and play; don't ask so many questions." Am I not right, mothers? While we were all very busy Karen undertook to sweep the living-rooms, and when I went in to go to my bed-room to dress, my first thought was that they looked neat and tidy. But, alas! a further examination proved disastrous to this opinion—for the *corners* had been neglected. I called the little girl and gave her a word of advice, telling her that it would never do if papa only plowed the middle of the fields; and what would happen if those corners were left dusty every day? Why, they would grow heaps and heaps of dirt and have to be shoveled out, at which Karen laughed gaily and went for the broom to try again. And now I find that my thoughtless words said the other day are about to be put to the test, for Janet came in just before dinner, and, with her honest eyes looking shyly away, told me that Sandy Muckleman, who is just out from the Highlands, has asked her to be his wife; that she hesitated because he was going off to Nebraska and she "couldna' thole ta leave the weans." And then she told me for the first time the history of their long waiting, how his parents depended on him for support, and she came to America to earn money a few years and then go back to Saudy. But now he was alone in the world and had sold his possessions and bought a farm in the West. I am very sorry to lose her; we shall miss her honest face and helpful ways, for we have *trusted* in her, since she came to us. But we are glad her future is assured, and think that Sandy Muckleman is a lucky fellow to win such a wife; for she will make a home wherever she goes and give it the adornment of her presence, while the touch of her busy hands will beautify the plainest of furnishings. And for us, I think there will be no trouble. Equally divided work the "many hands" make light, and if I have any doubts I shall lay them aside and say:—

"Yes, leave it with Him, the lilies do so, and the grow—
They grow in the rain and they grow in the dew. Yes they do."

And I shall not fear for our future while health and loving hearts are left to help us."

DOMESTIC RECIPES.

Apple Pudding.

Four large apples pared, cored, and chopped fine, two-thirds of a cup of raisins, seeded and chopped, two tablespoonfuls of minced suet, one-half cup of sugar, a pint of sweet milk, some slices of light, stale bread, two eggs, nutmeg. Line a shallow pudding dish with slices of stale bread well buttered, put in the apples, raisins, suet, sugar and nutmeg. Scald the milk and pour slowly over the beaten eggs, sweeten with two tablespoonfuls of sugar and pour over the ingredients. Cover and bake in a moderate oven three-quarters of an hour. Eat cold with powdered sugar.

Potted Fowl.

Cold roast fowl, a little lean ham, two spoonfuls of butter, salt and pepper. Cut all the meat from the bones, rejecting skin, shred, then pound in a mortar till a paste, add the butter, season, mix thoroughly, put into little pots, and tie down with thick paper or bladder.

Sweet Rusk.

At night make a sponge with a pint of warm milk, two spoonfuls of yeast and flour for a batter. Keep in a warm place. In the morning mix in one cup of sugar, half a cup of butter, two beaten eggs, a teaspoonful of salt, and flour for a soft dough. Mold into little balls, put into a greased pan and let them rise until very light. After baking, you can, if you please, wash the tops with sweet milk, egg, or molasses and water.

MRS. J. L.

Butter Crackers.

One quart of flour, four tablespoonfuls of butter, two large cupfuls of sweet milk, salt, and half a teaspoonful of soda dissolved in hot water. Cut the butter up in the flour, add the other ingredients, mixing well. Work into a ball and pound with the rolling pin half an hour or longer, turning the dough often. Roll into an even sheet a quarter of an inch thick, cut into little rounds, prick deeply and bake in a moderate oven.

Lady Cake.

One pound of sugar, one-half pound of butter, whites of ten eggs, one half pint of milk, one-half pound of flour, a teaspoonful of cream of-tartar, and one-half teaspoonful of soda. Flavor with bitter almond and bake in squares. Flavor the frosting with vanilla.

Marble Cake.

One cup of butter, two cups of granulated sugar, four eggs, one cup of milk, two even teaspoonfuls of baking powder, three cups of flour. After mixing the cake take out a teacupful and into it stir two tablespoonfuls of grated chocolate wet with a very little milk. Into your cake-pan pour in the yellow batter until an inch deep, then drop in a spoonful of chocolate mixture in two or three places. Give to the brown spots a little stir with the spoon and pour in more yellow batter. Again drop in the brown mixture, pouring over the yellow.

Orange Snow.

Juice of four large sweet oranges and grated peel of one, juice of a small lemon, a coffee-cupful of powdered sugar, a package of gelatine soaked in a cup of cold water, whites of four eggs beaten until stiff, a pint of boiling water. Mix the juice and grated rind of the oranges and lemon with the soaked gelatine, add the sugar and let stand an hour. Then pour in the boiling water, stir and strain. When the liquid becomes cold whip in the whites and pour into a wet mold.

M. B.

QUESTIONS ANSWERED.

Frozen Fruit.

E. H. P., Racine, Wis., says that a friend has a large supply of canned and preserved fruit—peaches, pears, jellies and jams, which lately froze. As they are in sealed glass jars he fears they will burst, or at least become spoiled when they thaw out, and our friend asks will either of these mishaps occur, and what should be done.

ANS.—If the glass jars had been filled "to the top with fruit," they would necessarily have burst. As they did not burst while freezing they are not likely to do so afterwards. The flavor of the fruit will not be injured and it will keep as well hereafter, if air-tight, but the pears and peaches will become soft from the freezing and thawing process.

Keep the kidneys healthy and unobstructed with Hop Bitters and you need not fear sickness.

News of the Week

HOME NEWS.

MONDAY, Jan. 17, 1881.

The mercury stood at 52 deg. below zero at Stevens' Point., Wis., Monday morning. A water famine has reached Galesburg, Ill., owing to the long-continued drought and cold, which have dried up or frozen the wells, cisterns and ponds supplying the city with water. In consequence of the lack of water the Chicago, Burlington and Quincy Railroad Company had to withdraw some of their engines, and on Thursday paid $50 for ice to melt in order to supply their engines with water. Brown's Cornplanter Works and many individuals are melting ice, which is obtained from the Mississippi River. The cold averages about 10 deg below zero every night.....A Japanese coasting steamer, with 60 passengers and a crew of 22, has foundered in the Inland Sea and 64 lives were lost. .....Houtzdale, Pa., has had a number of deplorable visitations. Since 1877 it has experienced two conflagrations, a great flood and a big riot, and now the diphtheria is taking off the children at the rate of a score a day..... ...Bjornstierne Bjornson, the great Norwegian poet and statesman, has had a grand reception at Chicago..... Prof. Alphonso Wood, the well-known botanist, died a few days since at his home in West Farms, N. Y. He was the author of several works on Botany.

The International Committee for the proposed World's Fair in 1883, assembled on the 10th inst.. at the City Hall, to prepare the work before them, Sixty-seven commissioners were present at the first day's proceedings, more than one-half of them being from outside States and Territories. The Inwood site was discussed, and a resolution finally adopted accepting it as the location for the Exhibition. Mr. Vanderbilt offered to subscribe $250,000 providing $4,000,000 can be raised. The work of getting subscriptions has been delayed but will now be pushed with persistence..... The resignation of ex-Mayor Cooper from the Commission was accepted and Cornelius Vanderbilt was chosen in his place. General Grant was elected permanent President of the Commission....

Nathan O. Greenfield, the several times respited Oswego (N Y.,) wife murderer, was sentenced on the 10th inst., to be executed on Thursday, February 17, 1881, in the Onondaga County Penitentiary.....Mrs. Alice Williams of Alpine township, Kent county, Mich., cut her tongue out with a razor. She was a devout Catholic and imagined a sacrifice to the Lord was demanded of her. Death will follow..... .....The strike of ice gatherers at Verplanck's N. Y. has been amicably settled .....A fire at St. Louis, which originated in the shoe store of Joseph Eade, 1114 Broadway, extended to a row of one-story shops and saloons, north and south, consuming them all. The wind carried the flames to the extension building of the Broadway Foundry, in the rear of these small houses, doing great damage to the valuable machinery and patterns as well as the foundry building.

G. H. Wales has paid $30,000 for the seat of W. C. Williams on the New York stock exchange. It is the highest price ever paid.....In Chicago 3,900 buildings were erected the past year, costing over $9,000,000.... ...In the Illinois Senate on the 10th, a bill was introduced to cede the Illinois and Michigan Canal and the improvements on the Illinois River to the United States, on condition that the National Government agree to convert them into a water-course for ships from the Mississippi to Lake Michigan.....Charles M. Phelps, ex-State Treasurer of New York and defaulter, who was convicted in October, 1875, of forgery and larceny on three counts and sentenced to five years' imprisonment on each, died of consumption in the Albany Penitentiary this week. He would have received a pardon in a few days had he lived. .....Thomas J. Kirk, a prominent iron merchant of Chicago, residing at Lake Forest, has committed suicide by shooting .. ....The boiler of a steam thrashing machine at Lucan, Ont., exploded, killing George Brumen and injuring a number of others.....On the 13th inst., it was officially announced that the consolidation of the Western Union and American Union telegraph companies was perfected and articles signed that day. The consolidation is said to be on the basis of the Western Union and American Union at par and Atlantic and Pacific at 50, with an entire new stock to be issued, and after the consolidation is permanently effected the lines are to be sold to the government.....A newspaper published near Elmira advertises to take buckwheat cakes and honey on subscription, and a limited amount of apple-butter.....Conrad Meyer, senior member of the firm of Conrad Meyer & Sons, probably the oldest maker of pianos in the United States died at his residence in Philadelphia on Tuesday evening at the age of 88 years. Mr. Meyer was born in Germany, and in the war of 1814 served in the campaign against Napoleon .....The old home of President Lincoln in Springfield, Ill., is now a cheap lodging house.... The boiler in the Union Flouring Mills of Detroit Mich., exploded on the 12th inst. with terrific force, tearing out the side of the building, completely wrecking the structure. Engineer Young and a man named Whittier, fireman, were instantly killed and buried under the debris. Three horses were killed.....

Rev. William Shelton, D. D., who for fifty-one years has been rector of St. Paul's Episcopal Church, has resigned for the reason of old age and ill health. Dr. Shelton is over eighty-three years of age. The parish have unanimously voted him a life lease of the church rectory.....The Regents of the University of this State met in annual session in the Senate chamber Thursday night Henry R. Pierson, Vice-Chancellor, was unanimously elected Chancellor, and George W. Clinton, of Buffalo, Vice-Chancellor.

Paul Sweet, residing about six miles south of Marshall, Ind., shot and killed F. M. Craig, familiarly called General Craig. The men met in the road, near the residence of the latter, when Craig said that the time had come for one or the other to die, and commenced firing Sweet at once returned the fire, killing him instantly.....Four hundred hands from the Grand Trunk works at Montreal are on strike. It seems that some 25 of them wished to attend a funeral, and asked permission to do so. Mr. Herbert Wallis, the superintendent refused. The men went on their own leave, and the next morning were discharged. Nearly all the men in the works at Point St. Charles threw down their tools and walked out, giving as their ultimatum the return of their comrades to work. As the company has been working night and day to complete the large works, the men will doubtless succeed in their demands.

The National Association of veterans of the Mexican War will hold its annual meeting in Louisville February 22.....At Jersey City, the Adirondack Steel Works are embarassed. Liabilities, $75,000; nominal assets, $50,000.....Rev. Edward Crowley, convicted of cruelty to little children in the Shepherd's Fold, at New York, of which he was manager, and who, on February 28, 1879, was convicted of ill-treating Louis Victor and sentenced to the penitentiary for one year and fined $250, has been released on the expiration of his term and the payment of his fine.....Jean Baptiste Narbonne, who confessed to the murder of his brother Dan, with his father and stepmother, at whose instigation he committed the deed, were each sentenced to be hanged on the 25th of February, between eight and ten A. M.....Warren Longmore, aged nine years, was, Thursday, found guilty of manslaughter in causing the death of Freeman Wright, aged eight, at Pembroke, Me. He has been sentenced to the State Reform School during his minority.....A terrible snow slide occurred in Wahsatch Mountains, Utah, on the 16th inst, by which several persons were killed and a town partially destroyed.

Dr. Theodore Christlieb, professor of theology at Bonn university in Germany, is to deliver a course of lectures on preaching before the students of the Yale theological school in 1882.....The Secretary of the Interior recommends an appropriation of $50,000 for the survey of Yellowstone reservation with a view to the allotment of the lands in severalty to the Indians.....The Board of Supervisors of Niagara county have adopted resolutions opposing the proposed International park at the Falls, and even the appointment of a commission to value the property that would be required for it. They assert that 80 per cent. of the voters of the county agree with them..... .A clerk in Andrews & Co.'s store, at Climax, Mich., while weighing out powder for a customer, somehow ignited the powder and one hundred pounds exploding the store was blown to pieces. Twelve persons were injured, nine of them badly. It is thought that the clerk and two others will die. Loss on the property, $3,000.

The will of the late J. F. Armour, of Chicago, brother of P. D. Armour, was admitted to probate on the 14th inst. It bequeaths to the heirs $7,500,000 and the executors gave bonds of $3,000,000. He bequeaths $100,000 for building a mission church and school in memory of his first wife, Amelia G. Armour.....The only survivor of a party of ladies who assisted in the construction of the "Star-Spangled Banner," which stirred up the patriotic fire of Francis S. Key and created a national anthem, Mrs. H. S. Sanderson, is living in Baltimore, aged 83.

The Supreme Court of Iowa, at Des Moines, has given a decision in a novel bank case, the point having never before, it is said, been decided in this country. It appears that a suit was brought on a note which required payment at B. F. Allen's bank. The note stipulated that it was to be placed in the bank, and the maker appeared at the bank when the note was due, and paid to the bank the principal and interest. The bank failed the next day, while the note was in transit from Indianapolis to the bank for collection, and the Court held that the payment to the bank was the payment of the note.....A new railway company has been organized at Evansville, Ind., to build a road from Evansville to Dayton, Ohio, 240 miles in length. The capital of the company is $6,500,000.....The United States has 24.77 miles of railroad to every 10,000 inhabitants. This is eight times as much as Europe, which has 3.29 miles to the 10,000..... ....The Wabash Railroad has announced the withdrawal of its claim to different rates between Chicago and all points on its line, and that it would sell tickets at the same rates as other lines. The Alton Railway upon learning this at once raised the fare from Chicago to St. Louis to $4.50 and to Kansas City $7. This rate was adopted by the Wabash and other competing lines..... New York musical circles are enthusiastic over a young violinist of a dozen years or so, named Mauricio Dengremont, whose performance is declared to be good for a mature player and marvelous for a lad.

The earnings of the Central Pacific Railroad Company for December were $1,853,000, as against $1,335,870 for the same month last year. The total earning for the year 1880 were $20,410,424, being an increase of $3,257,261 over 1879.

FOREIGN NEWS.

In Ireland the trial of the leaders of the Land League has become tame and uninteresting, five of the principal defendants being in London giving Parliament a world of trouble by obstructing all legislation. The League is still busy, chiefly in extending its membership by threatening evils to those who refuse to join it. It is also adding to the number of those landlords and land agents whom it is punishing by "Boycotting" them. The most prominent "tyrant" now undergoing this sort of excommunication is Bence Jones Esquire, a rack-renting landlord and agent at Clonakilty, County Cork. For years this "fraud" has been "posing" before the English public as a model Irish landlord earnestly doing good to an ungrateful, lazy, lying, drunken, treacherous tenantry. This is the character he has been trying to fasten on the whole Irish peasantry, in magazine articles, letters to the London newspapers, and a book he has published, while everywhere the fellow has been loud in puffing his own praises. On investigation, however, it turns out that Bence Jones Esquire—as he is fond of calling himself—is the meanest, most tyrannical, exacting and rack-renting of all the landlords in his county, and as the facts become known sympathy for him disappears. Wishing to ship his stock to England since he has been overtaken by the Boycotting Nemesis, the railroads refused to carry the animals, the Cork line of steamers declined to transport them, and after they had been taken to Dublin, it was only after much delay and loss that he secured their passage. From all accounts, Bence Jones Esquire richly deserved "Boycotting." The government is arresting large numbers of Land Leaguers for "terrorizing;" about 150 were arrested last Saturday in different parts of the island.

A split has taken place in the Irish Home Rule party in Parliament, Mr. Shaw, member for Cork, having seceded, with a few others, from the Parnell radicals. The Commission on Agricultural Depression recommend for Ireland a governmental scheme of emigration; also one of migration from over-peopled districts; a plan for the reclamation of waste lands, and a court of arbitration for fixing rents. They generally approve a modified form of peasant proprietory. The minority of the commission consider these measures as not sufficiently strong.

In England an attempt has been made to blow up the barracks at Salford. The explosion is believed to have been effected by dynamite, and is attributed to the Fenians. In the House of Commons all legislation has been blocked since the opening of Parliament by the obstructive tactics of the Parnellites, who are determined to prevent as long as possible the introduction by the Government of a coercive bill for Ireland. The war with the Boers in South Africa still drags along, with a few outpost skirmishes. England has sent a lot of troops and cannon to the scene of hostilities; but although Sir Bartle Frere while in charge of the Cape Colonies advised that the independence of the Transvaal Republic should be restored, the Government refuses to consider the subject until England's supremacy shall have been reasserted.

The latest report is that Greece will declare war against Turkey by the first of next month, unless the latter concedes the territory the Berlin Conference thought Greece should receive. France has already informed the bellicose little kingdom that while the Conference urged Turkey to cede the territory, it conferred no right on Greece to claim it by force of arms, and that if she goes to war she must not expect aid from the Great Powers. Turkey has sent a note to the Powers asking them to mediate in the quarrel between her and Greece, and suggesting another conference on the matter, hinting that she might be induced to yield a larger territory than she has hitherto acknowledged to be possible. It is most likely that a conference of the Ambassadors of the Great Powers at the Porte will settle the difficulty amicably. None of the Powers seems to want war just now, and the Grecian threats are mostly bluster.

In France but little of general interest has occurred of late. The moderate Republicans have been steadily gaining in all the elections that have been held, local as well as national. The army is now considered in a finer position—better disciplined, armed and more numerous than *ever* before, even in the days of the first Napoleon. For the last ten years the chief interest of the nation has been to prepare the army for any contingency.

[Keokuk Constitution.]

Every Time.

A man, or even a piece of machinery that does its work right every time, is, we think, very correctly judged "valuable." And certainly none the less valuable is any article designed to relieve the ills of mankind, and which does so every time. Mess. Jones, Cook & Co., Bay State Brewery, Boston, Mass., write: We have used St. Jacob's Oil among our men, and find that it helps them "every time." We therefore heartily recommend it as a pain-healing liniment.

AGRICULTURAL NEWS.

Alexander Hyde, of Lee, Mass., the well-known writer on agricultural topics, died in Boston on Tuesday, Jan. 11. A fall on the pavement on leaving the State House caused his death before he reached the hospital to which his friends were carrying him.....Representative Geo. B. Loring, of Massachusetts, the well-known writer on agricultural topics, is spoken prominently of as the successor of Gen. LeDuc as Commissioner of Agriculture, should the latter be removed from office. But of this removal there are no present indications.....The State Agricultural College at Manhattan, Kansas, has about 200 pupils, nearly half of them ladies.....The annual product of beet sugar in France amounts to the value of $55,000,000. The number of persons to which this industry gave employment in 1879, exclusive of those who raised the beets, was 68,582, of whom 51,023 were men, 9,365 were women, and 8,192 were children.....Extensive experiments in irrigation have been made in Kansas this season, and have proved very successful, one acre producing 1,000 bushels of sweet potatoes. It is proposed to utilize the waters of the Arkansas on the plains of Western Kansas, and stock companies are forming to take charge of the work.....The recent heavy snows have made it impossible for quail and partridges in different parts of the country to get their accustomed food, starving hundreds of them and driving others to farm-houses for something to eat.

For the week ended Dec. 18 there arrived at Liverpool from America and Canada 312 live cattle, 162 sheep, 150 pigs, 4,996 quarters of beef, 650 carcasses of mutton, and 301 dead pigs.....The famine in Russia, it is predicted, will assume proportions altogether beyond previous estimates, but no steps have been taken to meet it. The Russian peasant cannot afford at the best of times to eat wheat, and this grain has been sold long ahead to the Jews and other middlemen. What is wanted is an immediate importation of cheaper grain.....There was an auction sale of 62 head of Short-horns at York, England, Dec. 9, at an average of about $100 per head.....The annual report of Secretary McGlincy, of the Elgin Board of Trade, shows that the total number of boxes of cheese sold on that Board during 1880 was 233,940, and the total number of pounds of butter sold on the same Board was 2,670,877. The value of the entire product of both cheese and butter was $1,801,303.09. This is $281,270 less than the transactions of the Utica Board during the season of 1880 for cheese alone. The butter product of the Elgin district ranks deservedly high, and does honor to the State in which it is made. .....Much gratification is felt at St. Heliers, Island of Jersey, at the steadily increasing demand from the United States for Jersey cattle. The farmers are obtaining the unheard-of price of $1,000 each for their cows.... ....Kansas harvested 25,000 acres of Egyptian or Rice Corn last year, the average yield being 25 bushels to the acre. This corn was among Egypt's exhibits at the Centennial, and, as it thrives in the driest soil and under the intensest heat, and is preferred by cattle and fowls to Indian Corn, its widespread introduction is predicted.

The Nebraska State Farmers' Alliance met at Lincoln on the 6th, completed its organization on the 7th and adjourned. They "resoluted" against railroad exactions; against excessive bridge tolls on the Missouri; in favor of Congress improving the channel of that river; in favor of farmer legislators, and against the diversion of the Western part of the State from tillage to stock-raising..... The new Indiana State Board of Agriculture organized on the 6th by the election of President, R. M. Lockhart, Waterloo, De Kalb County; Vice-President, B. H. Hancock, Fredericksburg, Washington County; Secretary, Alexander Herron, Indianapolis; Treasurer, James A. Wildman, Indianapolis; General Superintendent, Fielding Beeler, Indianapolis; Executive Committee, Jacob Mutz, Shelby County; Robert Mitchell, Gibson County; W. H. Ragan, Hendricks County; and S. R. Quick, Bartholomew County. The time for the State Fair was fixed for Monday, Sept. 26, 1881, and to close on Friday evening, Sept. 30..... On the 6th also the Indiana Wool Growers' Association elected the following officers: President, Fielding Beeler, Indianapolis; Secretary, J. W. Robe, Greencastle; Treasurer, S. W. Dungan, Franklin. Notice was given of an amendment to the constitution providing for electing a Corresponding Secretary. It was resolved that next January the meeting be held on the same week with the annual meeting of the State Dairymen's Association, the Swine-Breeders' Association, and the State Agricultural Society. The Association adjourned until the regular semi-annual meeting in May.

A Michigan farmer has been detected in selling rolls of butter which had been made hollow, filled with water and frozen solid.....The exports of grain from the port of New York during the year 1880 reached 107,000,000 bushels, an excess of nearly 18,000,000 bushels over the exports of any previous year.....The agrarian outrages in Ireland during December, 1880, numbered 866, which was more than for the whole of 1879, and little less than the aggregate of the three preceding years.....The sales of wool for 1880 in the Boston market foot up a little rising 100,000,000 pounds against 128,000,000 for 1879.

The Ill., State Board of Agricultural resolutes against the manufacture of oleomargarine and suine, and Gov. McCullum of that State in his message to the Legislature urges it to amend the criminal code on the subject of adulteration of food, referring to these concoctions.....Connecticut has one farmer in her Legislature in the Senate and 63 in the House out of a total of 245—more farmers than men belonging to any other calling .....In Ireland wheat in 1880 was fully 3s. per 280 pounds or 5s. per quarter better in quality than in 1879; but the present price is 2s. per 280 pounds under last year, or 3s. 6d. per 480 pounds. The production per acre was no larger in 1880 than in 1879. ...The visible supply of grain, comprising the stocks in granary at the principal points of accumulation at lake and seaboard ports, and on rail from Western lake and river ports and frozen in on New York canals.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Jan. 15, 1880.

BEANS AND PEAS.—The bean market is quiet and round buyers can obtain go ds at the inside or shaded quotations. There seems to be no urgency to sell; the crop yield for '81 is believed to be smaller than the previous one, and if another European demand sets in sel ers will have a strong position. Eastern yellow-eyed eans dull at $1.75@1.80. Green peas plenty, not moving, and offered lower at $1.60@1 65. Southern B. E. steady at $2 per 2-bush. bag. Marrow beans prime $1.80, do, other $1.60@1.72, medium prime $1.70, do other $1.50@1.65, pea $1.60@1.75, white kidney $1.80@2.00, red do. prime $1.50@1.60, do. other $1.25@1.45, black or turtle soup $1.50, Lima $4.50@5.

BEESWAX.—There is a fair amount of stock on offer and a steady market; quoted at 23½@24½c. for Western and southern.

BUTTER.—Supplies continue moderate and with the possible revival of the export demand, prices keep close to last ranges. The present week makes a good showing in this way. The stock is estimated at about 2 150,000 pounds, but this is not deemed heavy, in view of a long winter. Still, if the interior holding is large dealers will not feel disposed to mark stronger prices than the year opens with, if, indeed, current quotations can be sustained. Very common styles of stock will be apt to drag in any event, as there is a surplus of that class reported on the continent and in England. At this season some very fancy State, Chenango and Delaware stock comes forward which exceeds general tub figures 2@3 ₱ lb. Western has about the best local run of buyers, fine grain-fed creamery leading the high class of trade, and the weather favors the exhibition and trying of useful cheap grades. Rolls are unusually plenty, as it is a convenient mode of packing at very cold points. They should be always cloth wrapped and there is no objection to the muslin being new or scrupulously clean.

Creamery, fine Western, 31@ good to prime, 31@33c; fair to good 27@30c State ranges, 20@30; State dairies, entire choice, 25c; fair to prime 22@24c.; firkins, 19@24c; State pails and half tubs, full, 28c, fair to prime 26@27c.; poor to fair 19@21c.; Welsh tubs, choice, 26@27c; other 19@23c; Western imitation creamery, 25@27c.; dairy, fresh, 23@24c; other 15@22c.; factory, fine, 21@22c.; other 14@20c, low quality, 12¼@13c.; rolls choice 18@19c, fair to good, 17@18c.

Receipts for the week, 21,050 pkgs.

Exports for the week, 8,527 pkgs.

CHEESE.—There is a better market on a decidedly freer export demand, moderate receipts and reduced stock. Exports for the week, 42,137 boxes. Quotations are for

State factory, fancy, at 13¾c.; do. good and prime, 12¾@13¼c.; do. fair to good, at 11¾@12¾c.; do. h'f skimmed, 9@11c.; Wisconsin factory, fine, at 13@13½c; do. good to prime, 12¾@12¾c.; do. fair to good, 11@12c.; Ohio factory, fine, 12¾@13¼c.; do. good to prime, 12@12¼c.; do. flat, fair to good, 10¾@11½c; do. poor to fair 8@11c.

Receipts for week, 39,804 boxes.

Exports for week, 45,223 boxes.

Liverpool cable, 67s.

Steam to Gt. Britain, 35@40s.

COTTON.—There has been a very good demand and the market closed steady.

January at 11.80@11 82c.; February at 11.95@11.96c.; March at 12.28c.; April at 12.28c; May at 12.40@12.41c.; June at 12.51@12.52c.; July at 12.61@12.62c.; August at 12.65@12.67c.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted.

Receipts for the week, 31,227 bales. Exports do. 8,830 do.

DRIED FRUITS.—Domestic dried apples have a fair demand and prices generally steady. Peaches are quiet unchanged. Small fruits have a light margin. Quotations are for

Evaporated apples at 8¼@9c. for the better qualities; sliced apples at 5¾@6¼c. for good to choice North Carolina; 3¾@4¼c. for Va. apples, 4@4¾c. for Tenn. do; 4¾@5¼c. for State do; 4¼@5¼c. for western Ohio and Mich. Peaches at 30@33c. for evaporated peeled; 16c. for unpeeled do; N. C. peeled at 20@21c.; for the better qualities, unpeeled peaches at 6¾@7¼c. for halves and 6¾@7c. for quarters. Plums at 15@16c. Blackberries at 3c. Cherries at 17¾. Raspberries at 25c. Whortleberries at 12¼@13c.

Receipts for the week, all kinds, 3,624 pkgs.

Exports for the week, 4 203 pkgs. dried apples.

EGGS.—Receipts for the week 1,500 bbls; do. last week, 1,175 bbls. Business is light and there is only a limited supply to trade in. Scarcity seems to prevail in all points, at least our high prices have not had the customary effect of bringing in lots from Philadelphia or other places. Limed are still doing wonders in the price-list for owners. It should be remarked that any liberality in receipts would reduce quotations. This is one of the most sensitive markets in this city. Near Points, doz., 40c; State and Penna, 35@37; Western and Southern fresh 35@37; Fall-laid stock 33@34c; stored fresh 30@32c.; State limed 30@31c; Western and Canadian do. 29@30c.

FLOUR.—As a rule buyers have had the advantage this week on full supplies and the easier course of the wheat market.

Quotations are: $3.00@3.75 for very inferior to very fancy superfine State and Western; $4.00@4 40 for poor to choice extra State and Western, odd lots and lines; $4 40@4 65 for choice to fancy do.; inferior to good white wheat, trade and family extras, $4 15@5.15; good to choice do. at $5.10@5.85; (very choice up to $6,25;) red and amber winter wheat inferior to choice trade and family, at $4.15@5.85; round hoop Ohio, $4,25@4 75; and trade and family brands of do at $4.80@6.25, the latter for fancy; St Louis $4.40@5.25 for inferior to good extra; $5.25@6.25 for good to very choice; Minnesota clear, inferior to very choice at $4 25@6,; Minnesota "straight," poor to very choice at $5 25@6.75, and patent inferior to fancy at $5.75@8.25; city mill extra at $5.10@5.35 for poor to strictly choice for the West Indies; do. for England at $4,15@4.90 for poor to choice spring wheat, and $4.65@5.50 for winter wheat product; do. trade and family extras $5.65@6,75; do. for South America, $5.45@5.75, the latter for very choice; No. 2 at $2 85@3.40 for very inferior to fancy.

Receipts for week, flour, bbls. 135 950; corn meal, do. 1,500; wheat, bush. 435,700; corn, do. 162,850; oats do. 115,350; rye, do. 18,000; malt, do. 24 350; barley, do. 36,100. beans, do., 7,532; rice, nkgs. 1,120.

Exports for week, flour, bbls. 107,850; corn meal, do. 4,775. wheat, bush 727,300; corn, do. 147,850; oats, do. 2,961; peas, do. 4,200; beans, pkgs. 424; rice, 1,050.

CORN MEAL—Quoted at $3.35 for Brandywine, and $2.65@3.25 for yellow Western.

FRESH FRUITS.—Exports of apples for week, 8,750 bbls. The apple market is without animation: buyers carry only small lots and then have to pick out a safe day for transportation. Stored Greenings and Baldwins fill most wants. Railroad deliveries are unsettled unless in marvelous good condition.

Baldwins $1.75@2; Greenings, $1.62@1.75 Spitzenbergs, $1.87@2; Lady apples $3@4. Cranberries quiet but not pressed for sale; holders calculate upon a long season; Cape Cod fancy bbls., 48; other $4@7; N. J. crates, $1 75@2,25. Florida oranges still overstock the market and the first heavy crop has met with a poor opening. Repacked standard half bbl. boxes $3@4,50; ordinary to good as they run, $2.50@3 50. Best in boxed pears are scarce and bring fancy prices, $7@8; Californias selling only in a small way. Peanuts have got into a strong position and close firm; Va. hand-picked 4¾@5c, ₱ lb; other 3¾@4¾, shelled 3¾@4¾c. Hickory nuts dull; $1.25. Black walnuts 40@50c. Pecans 8¾@9¾c.

FURS AND SKINS—Unbreased; prices too high for treaty under the discouraging advice from Europe.

GRAIN.—Wheat has felt the increasing visible supplies and has tended lower; exporters have taken 740,000 bushels for the week. Latest prices are for

No. 1 white at $1.16@1.16¾, do. January at $1.16@1.16¾, do. February at 1.16¾@1.17, do. March at $1.17¾@1.17¾, do. May at $1.17¾@1.17¾; No. 2 white at $1.15; ungraded white at $1.13@1.16; mixed winter at $1.16@1.16¾. No. 2 red at $1.18¾@1.19, do January option at $1.18¾@1.18¾; do. February at $1.18¾@1.19¾; do. March at $1.20@1.21, do May at $1.20¾@1,21¾; No. 3 red in lots at $1.16@1.16¾, ungraded red at $1.11@1.18¾. New York No. 3 Spring at $1.08; rejected spring at 93c

Rye at 97@$1.01.

Corn has ruled easy and moderately active: latest sales are of

New York No. 2 at 56¾@57c, do. January at 56¾, do. February at 56¾, do. March at 56¾@57, do. May at 54¾@55; ungraded mixed Western at 54@56¾, No. 3 at 54; New York steamer mixed at 54¾@54¾, New York steamer yellow at 55; No. 2 white at 58¾@59; steamer white at 56; yellow Jersey at 53¾@55.

Oats have been in active demand and closed with extra white at 50c; No. 1 white 49@50; New York No. 2 white at 48¾@49¾; No. 3 white at 46@47; New York No. 2 at 44¾@44¾, do. January at 43¾@44, do. February at 44¾@44½, do. March at 45¾, do. May at 45¾, No. 3 at 43¾@43¾, ungraded white Western at 45@48, ungraded mixed Western at 42¾@44, white State at 48@50@, mixed State at 46. No. 2 Chicago at 44¾.

HAY AND STRAW.—Receipts are fair but demand good and prices firm. Quotations:

Hay, prime timothy at $1.15@1.50 ₱ 100 lbs.; medium timothy at $1,10 do.; shipping grades at $1@1.05 do.; clover mixed at $1@1.10, clover at 90@95c. do. Straw—No. 1 rye at $1.20@1.30 ₱ 100 lbs.; No. 2 rye at 70@75c, do.; oats and wheat at 65@70c. do.

Exports for the week 994 bales.

HONEY—Remains quiet at the easier rates.

White clover, single, comb. 16@17c.; larger pkgs. do. 14@15c.; buckwheat 11@12c.; extracted 8@10c.

HOPS.—There is a generally firm market, and demand moderately active. Quotations are for

	Cents per lb.
New Yorks, crop 1880, prime and choice	21 @23
Do. medium	19 @20
New Yorks, crop 1880, low to fair	16 @18
Eastern, crop 1880	18 @22
Wisconsin, crop 1880	18 @22
Yearlings, crop 1879, choice	14 @20
Olds, all growths	4 @12
Bavarians	30 @35
Pacific coast, new	20 @24

Receipts for the week, 1,632 bales.

Exports for the week, 357 bales.

LEATHER.—Quotations for hemlock sole are light at 22@23 middle, 23@25; heavy at 23@25, and good damaged at 20½@22.

MILK.—Supplies are smaller but ahead of Winter wants. Commission cans of 40 qts. sold during the week at an average of $1.71½.

OIL-CAKE.—Western is quoted at $29@29 50 per ton.

POULTRY AND GAME.—Dressed poultry shipped by express is doing well: freight-shipped turns out more or less frozen and buyers will not bid high for it. Large turkeys very slow of sale; more chickens than fowls wanted. Prime ducks and geese sell well. Drawn poultry similar to that dressed for eastern use is in no favor here.

Turkeys, N. J. small, 13@13¾c; other, 12@13c, State, small, 12¾@13c.; other, 11½@12c.; Western, small, 12@12¾c.; other, 11@12c.; poor to fair, 8@10c.; Philadelphia d.-p., 13@15c.; chickens, choice, 15@16c.; good to prime, including scalded, 12@14c.; poor 9@11c.; chickens and fowls W. 9½@12c.; cappons, 20@21c; slips, 16@18c.; fowls, good to prime, 10@13c.; do. poor, 8@9c.; ducks, choice, 14@16c.; other, 10@13c.; geese, choice, 11@12c.; other, 8@10c.; squabs, dark ₱ doz., $1.50; light, $2,75@3.

Live poultry is in fair demand and in good supply for winter.

Fowls, 10@11c. ₱ lb.; chickens 8@9c.; roosters, 5@7c, turkeys, 9@11c which is lower; ducks, best, 75@87c, other 50@70c. Geese, extra, $1.87@2; other $1.25@1.75. Pigeons, 20@25c.

Game is bringing good prices in a rather restricted way. All prime birds firm.

Canvas back duck $1.50@2, red-head 50@87c, mallard 50@60c; blue wing teal 40c, green do., 35c common 20@30c, quail ₱ doz trapped $1.87@2; poor $1.50@1.75; partridges, ₱ pair 60@90. Geense prime $1.12@1.15, drawn 80@$1; hares, 25@50, Rabbits, 25@30.

PROVISIONS.—Hog products have been active.

Mess pork quoted at $13@13 25 old on the spot. Bacon at 7½ for long clear and 8 for short clear. Lard—Western steam at 9.33½ for spot lots. 9.30 for Jan., 9.30@9.32½ for Feb., 9.40 for March. Stearine at 9¾@9¾. Tallow at 6¾@6¾ for prime. Beef hams at $18@18.50. Beef—extra India mess quoted at $21@22 for city; $10.50@11 for extra mess; $9.50@10 for plain mess; $13 to $14 for family mess; packet at $12.

Receipts for week, beef, bbls. and tcs., 650; pork, 2,150 bbls.; cut meats, 40,100 pkgs.; lard, 23,700 pkgs.

Exports for week, beef, bbls. and tcs., 2 668; pork, 8,014 bbls.; cutmeats, 15,469,075 lbs.; lard, 6,192,000 lbs.

SEEDS.—Clover is quiet; Western is quoted at 7¼@8½c.; Timothy has a light demand; quoted at $2.75@2.85.

SUNDRIES.—Cider jelly 8@ ₱ lb; feathers, prime, 45@50c; maple sirup $1 ₱ gal.; pop corn 2@3c; no large quantities wanted.

TOBACCO.—Exporters are doing little and trade is moderate; prices are steady.

LIVE STOCK MARKETS

NEW YORK, Saturday, Jan. 15, 1880.

BEEVES.—Receipts for the week 13,451 head: do. last week, 11,171 do. The market opened well on Friday, but the later sales were slow and there was enough decline to call it a ½c. compared with Wednesday's market. Market closes weak with heavy prospective supplies. Common to medium steers, 8@9¾c., dr. 55@56 lbs.; fair to good, 9¾@10¼c., dr. 56 lbs.; prime to choice, 11@12c., dr. 57@58 lbs. The run of quality unusually heavy.

COWS AND CALVES.—Latterly supplies have exceeded the demand and prices are now weak for any quality under choice. The range is $55@60 ₱ head, the latter for singles above prime.

VEAL CALVES.—Common calves are slow; primo in good demand.

Live choice fed 7¼@8c. poor to prime 6@7¼. Mt. Holly 5@8, buttermilk, 4@5, grass, 2¾@3¾, hog dressed choice 9¾@10, fair to good 8¾@9, common 4¾@6¾.

SHEEP AND LAMBS.—Receipts for week, 29,359 head; do. last week, 28,365 do. Market slightly overstocked with sheep; prices easier. Common to medium, 4¾@5¾c.; fair to good, 5¾@6¾c.; Lambs, 6@7¾c.; a few Canadian, 7¾c.

SWINE.—Receipts for the week, 42,728 head: do. last week, 31,331 do. The demand is active for live or dressed, cold weather favoring packers. Live corn fed, $5 05@5.15 ₱ 100.

Country dressed pork light 7@7¼c.; medium, 6¾@7c.; heavy, 6¾@6¾c.; city dressed State 6¾@7¾, city dressed Western 6¾@6¾, Western dressed 6¾@6¾. Pork tenderloins 12@12¾.

KIDNEY-WORT
PERMANENTLY CURES
KIDNEY DISEASES, LIVER COMPLAINTS, Constipation and Piles.
Dr. R. H. Clark, South Hero, Vt., says, "In cases of Kidney Troubles it has acted like a charm. It has cured many very bad cases of Piles, and has never failed to act efficiently."
Nelson Fairchild, of St. Albans, Vt., says, "It is of priceless value. After sixteen years of great suffering from Piles and Costiveness it completely cured me."
C. S. Hogaboom, of Berkshire, says, "One package has done wonders for me in completely curing a severe Liver and Kidney Complaint."
IT HAS WONDERFUL POWER. WHY?
Because it Acts on the LIVER, the BOWELS and the KIDNEYS at the same time.
Because it cleanses the system of the poisonous humors that develope in Kidney and Urinary diseases, Biliousness, Jaundice, Constipation, Piles, or in Rheumatism, Neuralgia and nervous disorders.
KIDNEY-WORT is a dry vegetable compound and can be sent by mail prepaid.
One package will make six qts of medicine.
TRY IT NOW!
☞ Buy it at the Druggists. Price, $1.00.
WELLS, RICHARDSON & CO., Proprietors,
12 (Will send post paid.) Burlington, Vt.

Liquid KIDNEY-WORT
In response to the urgent requests of great numbers of people who prefer to purchase a Kidney-Wort already prepared, the proprietors of this celebrated remedy now prepare it in liquid form as well as dry. It is very concentrated, is put up in large bottles, and is equally efficient as that put up dry in tin cans. It saves the necessity of preparing, is always ready, and is more easily taken by most people. Price, $1 per bottle.
LIQUID AND DRY SOLD BY DRUGGISTS.
WELLS, RICHARDSON & CO., Prop'rs,
A Burlington, Vt.

LANDS AND HOMES
Short winters, low taxes, good society, convenient markets, superior schools, healthful climate. Excellent for Stock, Fruit, and Farming. ☞ The best Tobacco Region in the West.
1,000,000 acres well-watered Timber and Prairie Lands along the line of the St. Louis and San Francisco R. R. for sale at from $2,50 to $8 per acre on seven years' time. Free transportation from St. Louis to purchasers of land. Send for maps and circulars.

Reading for the Young.

A LITTLE STORY TELLER.

WHAT do you think
Has happened to Rover?
The most dreadful thing
The whole world over—
If anybody else had told me so
I wouldn't have believed it—no no, no!

Oh, dear—let me see—
I suppose I must tell—
You know our folks
Have got a big well;
It's dark and it's big, and, oh, such a place!
I've told him so to his very own face.

He's a bad, bad child;
He wouldn't mind;
He would go on the edge
As if he were blind;
And, oh! don't you think, he's tumbled way over,
And the water's all covered my poor little Rover!

See, here comes Rover now!
See, he ain't dead!
Now *can't* I make up things
Out of my head!
I guess if the editors knew what was smart
They'd take *my* stories instead of yours, Uncle Mark.

FARMING FOR BOYS AND GIRLS—NO. 10.

HENRY STEWART.

Harrowing.

IT will be plain, to one who knows how plants feed and grow in the soil, that the finer the soil is, the better the plants can feed and grow. Every little rootlet is a mouth pushed out to find food. If it meets in its course only fine particles, through which it can penetrate with ease, it throws out branches in its course until it occupies the whole soil. In this way the roots of a plant soon form a close net-work of fibers, which grasp and surround the soil and suck up from it its moisture, in which is dissolved the plant food. But if the soil is in hard lumps, the root pushes on with all its strength, vainly trying to enter these masses, and becomes merely a single thread, gathering no food, but really tiring out itself until it is starved or greatly weakened.

Again, when the soil is in lumps and clods, there are large air spaces between these and the surfaces become dry, because the moisture evaporates from such soil or sinks down into the subsoil too quickly. Then the root perishes, and the plant not only fails to find food, but all the work it has done is lost, and it is to that extent weakened.

From this it will be seen how necessary it is to break up the soil and reduce it to as fine a state as possible. This is done by harrowing the soil, immediately after it is plowed and while it is fresh and soft, and can be easily broken up. But there is a right and a wrong way to do everything, and the harrow may either not be well adapted for its purpose or it may not be properly used. A harrow is usually a wooden frame provided with iron or steel pins or teeth, set upright in the frame or slanting backwards. Recently an improvement has been made which consists of using sharp-edged discs or wheels mounted on a frame instead of teeth, and for some purposes this is very useful. For instance, when a sod has been plowed and turned under, it is very difficult to use a straight toothed harrow without tearing up the sod, and this has a bad effect, and prevents the farmer from reaping the most advantage from his work, as we shall see when we come to think about the plowing under of sod. The sharp wheels of the disc harrow, cut up the surface into very small pieces and as they are placed a little sideways on the harrow, they scrape the soil to one side a little and turn it up into small ridges of soft, loose soil and thus prepare a very excellent bed for the seed. The same effect is produced, but only to a smaller extent, by the sloping-tooth harrow which passes easily over the surface without tearing up the sod under it, and for some purposes, such as covering seed, this kind of harrow is very useful.

The common kind of harrow works the best on stubble land and when drawn across the furrows. It should always be drawn from a corner or near the corner, as this brings the lines of the teeth close together and breaks up the soil more thoroughly. When a harrow of this kind is drawn across the furrows, the teeth break up the furrow-slices very completely, and as they break these and stir the ground they fill up all the loose spaces between the lumps with fine soil, and make the ground compact as well as soft, and fit it precisely for the needs of the roots which are to grow in it. But when drawn along the furrows it is very clear that it cannot break up the ground nearly as well, because hard slices cannot be penetrated by the teeth.

To produce the best effect the harrow should be drawn by a short chain, which permits it to vibrate from side to side with a sort of zig-zag motion, and also causes the harrow to lie flat, so that every tooth does its work and none of them are lifted out of the soil, which would be the case if the harrow was hitched short and close to the traces. Harrowing is thought to be a very simple thing and is too often slighted on this account. But if we consider its purpose and what is gained by it, and watch a harrow at work and examine the soil before and after harrowing, we shall find it a very important business, and one that should be done with the greatest care and attention. In fact, by such consideration we shall learn that there is no work on the farm, but has a deeper purpose in it than appears at first sight, or to one who does not think; and that thinking about the work will help us very much to do it in the best manner.

A WORD TO YOU, BOYS.

FIRST: Be honest. By which we do not mean, simply, not to steal. That goes without saying. The young man who, before his beard is grown, thinks it clever to cheat his tailor, or to sneak out of his little debts at college, has already laid a sure foundation of ill fortune. Nothing is known so quickly or sticks to a man so long as the reputation of dishonesty. It is the fleck of mildew which eats and grows blacker and spreads from year to year.

Boys are fatuously blind to the lengthening shadows which these faults of sharp-dealing and lying in their earliest years throw down their whole future. In a year or two they will be asking for patronage from the public or a chance in the business world, and they will find that in damaging their character they have already squandered their only capital. No merchant would take a boy even as porter into employ who was not known to be honest.

We take it for granted our boys are honest, in the coarsest meaning of the term. But there is a finer honesty that enters into a man's nature and lifts him above his fellows. He is no sneak nor sham, neither to his companions, his God, nor even to himself.

As the boy begins, so the man will end. The lad who speaks with affectation, and minces foreign tongues that he does not understand at school, will be a weak chromo in character all his life; the boy who cheats his teachers into thinking him devout at chapel, will be the man who will make religion a trade and bring Christianity into contempt; and the boy who wins the highest average by stealing his examination papers will figure some day as a tricky politician.

The lad who, whether rich or poor, dull or clever, looks you straight in the eye and keeps his answer inside of the truth, already counts friends who will last all his life and holds a capital which will bring him in a surer interest than money.

Then get to the bottom of things. You see how it is already as to that. It was the student who was grounded in the grammar that took the Latin prize; it was that slow, steady drudge who practiced firing every day last Winter that bagged the most game in the mountains: it is the clerk who studies the speciality of the house in off-hours who is to be promoted. Your brilliant, happy-go-lucky, hit-or-miss fellow, usually turns out the weight of the family by forty-five.

Ready for you in your early manhood, there are plenty of pleasures waiting for you to conquer—applause, money, society, this and that kind of philosophy or faith. Take nothing on trust; weigh it, see what it is worth. You will have rough disappointments, but you will come to the granite underneath at last.—Tribune.

LETTERS FROM THE COUSINS.

DEAR UNCLE MARK AND RURAL COUSINS:—I have long cherished a wish to write to you and tell you how much I love and appreciate the dear RURAL. It has been a constant and welcome visitor to me for the past three years, and in renewing my subscription, I must say that I cannot afford to do without it.

I remember the first one that I ever saw some 25 years since; it had the deaf and dumb Alphabet in it which I took great pleasure in learning. I would like to join the Horticultural Club, as I am a great lover of flowers, and the beautiful in general. I admire the artistic taste displayed by woman in arranging her flower-pots and in flower culture. I admire her devotedness not only at home, but on the battle-field administering to the wants of the wounded and dying soldiers, as only a woman can, and in carrying the Gospel to the benighted heathen and in many other ways her devotedness is exhibited. How many sad hearts have been cheered and strengthened for life's battle in the perusal of the RURAL'S pages? Who can tell?

I think that the free Plant and Seed Distribution cannot fail to be of great value in disseminating new and choice varieties of plants and seeds. It gives children an interest in cultivating the beautiful in Nature and is far more valuable than the so called "Chromos" and "Oil Paintings" which are "given away" as Premiums.

I have taken great interest in the seeds which you so kindly sent me from time to time. I received the Cuthbert Raspberry some time ago, for all of which accept my sincere thanks. The reliability, trustworthiness and honesty of the RURAL places it in the front rank of Agricultural Journals and I hope that nothing will ever creep in to mar its fair pages, and that the same sympathy and patronage may be extended to it in the future as it has had in the past. VIOLET.

Oxford Co., Canada.

DEAR UNCLE MARK:—I think it is about time I wrote and thanked you for the seeds you so kindly sent me last Spring. I wrote a letter some time ago but as it was pretty long, I did not see it in print and I supposed it found the waste basket where a great many letters go. I had pretty good luck with my seeds last Summer. The musk melons were just splendid, one weighing seven pounds. As a general thing they were not very large but I had a great number of them, they were of such a delicious flavor that every one admired them that tasted them. Out of the five okra seeds I received only three grew. The pinks, portulacas and phloxes were very nice and flowered until the frost killed them. Every thing was nice but the mignonettes; they grew and covered the ground all over but they did not have any sweet smell at all. I did not receive any coxcomb seeds. I have three hybrid penstemons, one magnolia tree and one grape vine. My brother had a lot of mangolds one weighing sixteen pounds. The oats also were nice. Out of the three willow cuttings two grew. I am a great lover of flowers and have a great number; among them, I have eight different kinds of roses. Grandma has a lemon tree about thirty years old. It is about four feet high and its leaves are about six inches long. She puts it out in the garden in the Summer time and keeps it in the house in a big box in the Winter; it never blossoms nor bears any fruit. I wish to ask if it was grafted would it bear fruit, if so where could she get grafts. L. H.

Oshawa, Ontario.

[The lemon tree can be successfully grafted. Grafts may be obtained of Parsons & Sons, Flushing, L. I., also of P. J. Berckmans, Augusta, Ga. —U. M.]

DEAR UNCLE MARK:—Many thanks for the seeds you so kindly sent me. They grew finely and flowered beautifully, especially the phloxes, and pinks. We have just been having a long California rain lasting three weeks, which some of the cousins will think is awful, but it is not. The weather is nice and warm; the plants out-doors are growing and blooming nicely; the grass is green, and the mercury is up to 58 deg. this morning. We have boquets of roses and other flowers all the time. My brother takes the RURAL he likes it very much. He received his potato in good condition. I am afraid my letter is getting too long so will close. ALICE SNYDER.

PENTZ, Butte Co,, Cal.

UNCLE MARK:—I have a corner in our garden that I have for wild flowers. I have some Bloodroot and Wild Phlox, Wild Anemones, both single and double Hepatica, Dutchman's Breeches, two species, and some ferns. I would like to join the Horticultural Club. My brother takes the RURAL NEW-YORKER and we like it very much. I have a parrot, it is so tame we can handle it most any way we please; it talks some. I want to ask you a question: is it natural for Roman Hyacinths to come up now, in this climate. ELSIE.

Bucyrus, Ohio.

[Hyacinths sometimes come up in mild Autumns, but this weather will cure them of that.—U. M.]

UNCLE MARK AND RURAL COUSINS:—I have read the letters from the cousins to my little brother, and he has been teasing me to write, so I venture for the waste-basket. One of my older brothers has taken the RURAL for three years and would not part with it. I am fifteen and my little brother is nine years old. It is so cold in Winter that we can only raise annuals. We have a few house-plants. If we can join the Horticultural Club please put our names on the list.

Grundy Co., Iowa.

ROSY AND ANDREW BENTON.

DEAR UNCLE MARK:—I am a little boy nine years old. My pa takes the RURAL and I like to read the letters from the cousins very much. I want to join the Horticultural Club and be one of the cousins. I cultivate a garden every year, and raise beans and peas, beets, radishes, tomatoes, cucumbers etc. I grafted some wild goose plums last Spring, and some of them grew and are doing well. I have lots of pretty flowers too, such as portulaca, balsam, petunia, phlox and lark spur. Please send me some seeds next spring.

Dallas Co., Texas. EMMANUEL C. HATCHER

Sabbath Reading.

ONE DAY AT A TIME.

Only one day
To bear the strain
Of living, and to battle with the pain.

Only one day
To satisfy
With food and covering, as the hours slip by.

Only one day
To-morrow's care
To-morrow, if it comes, itself shall bear.

Only one day—
Then waste it not
In futile planning where the Lord is not

Only one day
God gives to me
At once. Oh, may I use it faithfully!

A NEW COMMANDMENT.

EXTRACT OF A SERMON, BY JOHN STOUGHTON, D. D.

COMMENTATORS are not agreed as to whether our Lord intended that his new commandment should be taken as an addition to the ten delivered on Sinai. Be that as it may, even if it be a misnomer to call it the eleventh commandment, we shall all agree that it points to something in the Gospel of our Savior which goes beyond the Law of Moses. That something, I shall endeavor at once to illustrate.

It is a new commandment. In a certain sense it is from the beginning—the law as well as of the Gospel—yet also it is new, as to its form. There was a compression, a terseness, a pungency in our Lord's teaching quite original. He did not deal in a multitude of words, a thick forest of verbiage in which a listener is presently lost. No crowd of particulars, no host of minute specifications, such as learned casuists have been wont to suggest, do you find in his lessons—but that which is to the point—that which strikes into the heart of a subject, cleaving it and laying it open.

Compared with the wearisomeness of Rabbinical teaching, our Lord's method was obviously new. Even the old ten commandments, delivered on Sinai amidst lightnings and an earthquake, and which pealed out, one after another, in slow solemn grandeur, the great teacher condenses into two brief sentences—"Thou shalt love the Lord thy God with all thy heart, and with all thy soul, and with all thy mind. This is the first and great commandment. And the second is like unto it Thou shalt love thy neighbor as thyself. On these two commandments hang all the law and the prophets." Here we have a new and abridged edition of the Sinaitic code. One of the ten precepts might easily be dropped out of the enumeration, but these two contained the essence of the whole, and no drop of either could be ever lost. It is true, each of the epitomes just cited may be found in the writings of Moses, but there you do not find the two compactly brought together as in the words of Christ: so entwined here are they in the most portable of forms, that they can hardly ever, through fault of memory, be rent asunder. Our Lord's summary was something new. The text is in exact keeping with the second saying—"Thou shalt love thy neighbor as thyself," only it presents the law of charity under a new aspect in this way.

It is not addressed to the world at large—not to the mere citizen, who may live in the same street, next door to another who has only a common claim on his regard; but it is addressed by the Savior to his own disciples—to those whom he had called out of the world, and brought into select fellowship with Himself, to those whom he addressed by the endearing epithet "little children"—an expression we can scarcely help uniting with his words on another occasion: "Except ye be converted, and become as little children, ye shall not enter into the kingdom of heaven." These men to whom he spake were within the kingdom, they had bowed down their heads and entered the low strait gate as little children—they had been new born into his own new family of love; and now, looking on them with a smile of affection, he bids them be brotherly, he bids them be united, he bids them clasp hands together in his presence, and swear a league of undying friendship. "A new commandment I give unto you," members of a new spiritual family such as were never seen on earth before—"that ye love one another."

It is *new* in point of *example*, and here we get closer to the true idea of its newness. He exemplified it Himself—as Moses had never done, as the prophets had never done. A pattern of perfect love had never before been beheld in this selfish world. The love of Jacob for Rachel was very beautiful and tender; the love of Jonathan for David was passing the love of women; the love of the Maccabees for their country was noble and heroic; so was the love of certain Grecks and Romans—but Christ's love rose above that of wife, or friend, or country, was of another order, of another stamp, of another spirit, went more entirely out of self, so as to carry not the faintest shadow of self where it went. Such other loves, as those just touched on, fall back again, if I may say so, on the lover. The wife, the friend, are part of self, and are essential to the lover's enjoyment, without them he cannot live. They minister to his felicity, he is lost without them—so with his country to the impassioned patriot; he pines away and dies apart from it.

A GOOD conscience is the palace of Christ, the temple of the Holy Ghost, the paradise of delight, and the standing sabbath of the saints.

WHEN the winds of applause blow fresh and strong, then steer with a steady hand.—M. Henry.

Why be sick and ailing when Hop Bitters will surely cure you?

PERSONAL ITEMS.

General Hawley, the new United States Senator from Connecticut, was born in North Carolina.

Ex-Governor Warmoth, of Louisiana, will get from his plantation a million pounds of sugar this year—it is said.

Ex-Governor Horatio Seymour is in ill health and says that he "will have to nurse himself until Spring."

President-elect Garfield is said to be fond of horseback exercise and at Mentor rides every day several miles.

The late Dr. Chapin was very much worried during the last years of his life by the rattle of his false teeth while he was preaching.

"R. B. Hayes, President of the U. S." is flanked on one side in the Washington directory by "R. H. Hayes, barber," and on the other by "T. J. Hayes, shoemaker."

President Hayes and the White House during 1880 cost the government $119,964, $50,000 of which Mr. Hayes received as his salary, the other $69,964 being for White House expenses.

Queen Victoria has placed Osborne Cottage at the disposal of the Empress Eugenie for a few weeks. The Empress will take up her abode at her new residence in North Hants in the Spring.

Ex-Confederate Generals are, many of them achieving fame and fortune in rosier paths than of old. Major General Marmaduke is a Missouri railway commissioner, and, as a bachelor, lives comfortably in St. Louis on a salary of $5,000 a year. General J. B. Gordon, as counsel for the Louisville and Nashville road, gets a salary of $14,000. Major General F. B. Cheatham has a handsome farm in Tennessee. General Toombs practises law, and is very rich. General Basil Duke is a lawyer in Louisville, and has a good income; General Bradley Johnston is also getting rich in the same profession in Baltimore. All the sons of Robert E Lee, except one, are moderately successful farmers in Virginia. The exception, Custis Lee, succeeded his father as president of Washington-Lee University. General Jubal Early is living quietly at Lynchburg in comfortable circumstances. General J. C. Pemberton has become a resident of Philadelphia, is an invalid, and has written a book on Vicksburg.

[Cairo (Ill.) Radical Republican.]

What We Know About It.

"What do you know about St. Jacob's Oil?" said one of our oldest subscribers. This was a fair question, and we answer that we are reliably informed that a gentleman of this city who has suffered untold agony, and spent a mint of money to get relief from Rheumatism, in desperation bought some and tried it, and declares that it is the best remedy for Rheumatism he ever heard of.

BRIC-A-BRAC.

A LOVER'S INDECISION.

Do I love her?
Dimpling red lips at me pouting,
Dimpling shoulders at me flouting—
No, I don't!

Do I love her?
Prisoned in these crystal eyes
Purity forever lies—
Yes, I do!

Do I love her?
Little wild and willful fiction,
Teasing, torturing contradiction—
No, I don't!

Do I love her?
With kind acts and sweet words she
Aids and comforts poverty—
Yes, I do!

Do I love her?
Quick she puts her cuirass on,
Stabs with laughter, stings with scorn—
No, I don't!

Do I love her?
No! When to my arms she flies,
Filling me with glad surprise—
Ah! yes, I do!

Will. Speir, having occasion to cross a bridge where a penny toll was exacted for foot passengers, pleaded poverty, and begged to be allowed to pass free. The tollman was inexorable. Will protested. "Wee'l, I canna pay you." "You cannot pass then." Maun I staun still here like ane o' the stoops o' your yett?" "Yes, or return the way you came, or beg a penny to pay the toll." "Gang back! you gauk," said Will: "would ganging back hain your brig, wonld it no wear't just as muckle as my coming alangs't it did—I hinna time to gang back the noo—there's your penny to you man; an' the neist time I come this way I'll gang a whole day on't atween the inside o' the yett there and the tither end, and take my pennyworth oot o' the brig."

THE funniest man in all the town
He thought himself did Mr. Brown.
While at the club one night he saw
A new silk tile upon the floor,
And winking to the crowd so slick
He gave the hat a gentle kick;
And then another, just to show
That wit from empty heads can flow.
All caught the humor of his fun—
To kick the hat they vied each one,
There ne'er was such a joyful crowd,
And Mr. Brown felt very proud,
And when leave-taking came broad smiles,
All wore while putting on their tiles,
Save Mr. Brown, whose mirth was flown—
The hat so crushed was all his own.

"What do you learn at school?" asked Uncle Tom. "Nawthin," said Bill, working away at a tangle in his fishline. "What do you study then?" asked the uncle again. "Nawthin," replied the nephew. "What on earth do you go to school for?" roared the astonished uncle. "Same thing, I reckon," replied Bill; the assistant is young and pretty, and the principal is a bachelor, and that's about all there is of it."

A WISHBONE.

HE held one side and she the other;
What did he wish? I could not tell;
He pulled, she pulled, and then her mother
Came in; perchance 'twas just as well.

For after it was passed he told me
His wish, a wish I should not name,
'Twas for a kiss; a bird sang near me
And told me hers; it was the same.

A BLOTTING PAD.

"HAVE a blotting pad, sir?" asked a peripatetic dealer, reaching out one of those absorbents.

"How do you fasten the thing on?" inquired Jones, after turning it over and over.

"Fasten it on!" exclaimed the peddler; "what do you mean?"

"What do I mean?" cried Jones, looking up. "Young man, I've had experience in this pad business. I've bought them for the head, stomach and liver, and this is the first one I ever saw with no tackle on it. No, I don't want it. Good-day."

The man saw it was no use to argue with Jones.—Boston Transcript.

THEY sat together at the grate,
And merry jokes were telling:
She shook the popper o'er the coals
And he the corn was shelling.

How beautiful it looks cried he,
Don't think I tell a whopper;
I wish I had it in my hand
And you were in the popper.

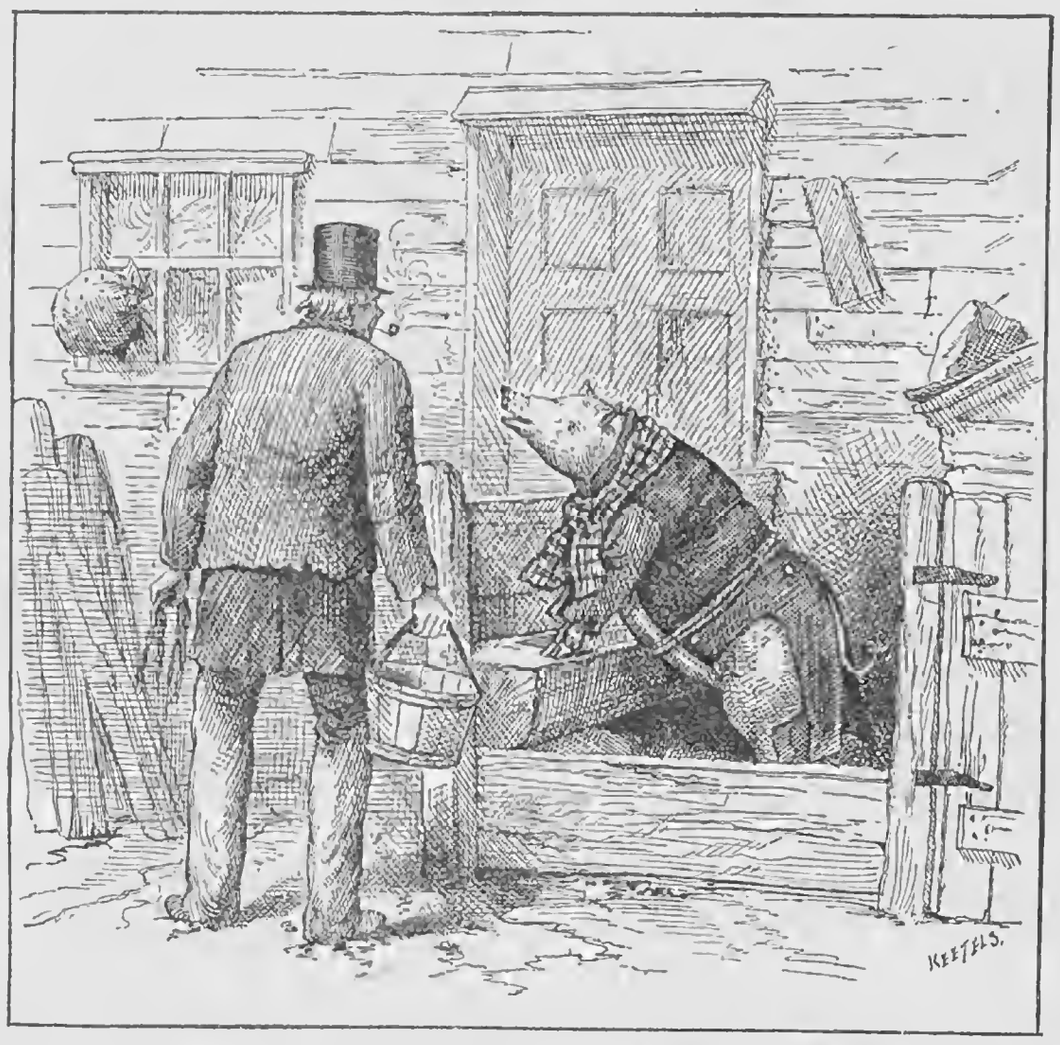
Pray, what have I so evil done,
Said she, to merit roasting?
I don't believe that just for fun
You'd give me such a toasting.

But don't you see my Mary Ann
How swiftly leap year's hopping
And if I had you in the pan,
Why then you'd do the popping.

A VULGAR FOP called to a bootblack to polish his shoes, and showered vituperative epithets upon him for his slowness, till at last the little fellow stopped his work, and looking up exclaimed; "See here, mister, 'taint no use to work on your shoes any more till somebody polishes your tongue!"

OBEDIENCE.—"Don't waste your time clipping off the branches," said the woodman to his son, "but lay your axe at the root of the tree." And the young man went out and *laid* his ax at the root of the tree, like a good and dutiful boy—and then went fishing. Truly, there is nothing so beautiful as filial obedience!

THE reason why the poets speak of October as "sober" is because sober is the only word they can find to rhyme with October.



PREPARED FOR A SEVERE WINTER.

Humorous.

"WHAT have you been drinking, or eating?" exclaimed his wife, as he returned late at night. "Liquor-ish," he responded, and then he winked at himself in the dark and breathed thin till he got asleep.

ONE of the most provoking episodes we can just now think of is to meet a lady friend, and in endeavoring to raise your soft hat by the crown, find yon have on your Derby, and claw all over the top of it before recalling the change in head-gear. In the meantime the young lady glides by, wondering what the mischief is the matter, and if you are losing what little mind you once possessed.—Lockport Union.

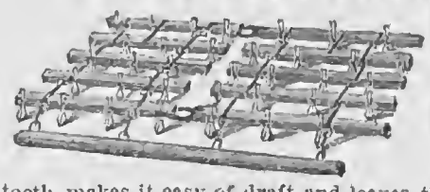
THE nervous mother of a bright little boy was alarmed lest he should take the whooping cough, which prevailed in the neighborhood. She talked so much about it and worried over it, that she had infected the child with her fears to such an extent that he would scarcely leave her side. One night after the little fellow had been put to bed and asleep, a donkey was driven past the house, and when just opposite set up his he-haw. With a shriek the little fellow was out of bed, screaming at the top of his voice, "The whooping-cough is coming, mamma; the whooping-cough is coming."

"TOMMY, my son, what are you going to do with that club?" "Send it to the editor, of course." "But what are you going to send it to the editor for?" "Cause he says if anybody will send him a club he will send them a copy of his paper." The mother came near fainting, but recovered herself sufficiently to ask: "But, Tommy, dear, what do you suppose he wants with a club?" "Well, I don't know," replied the urchin, "unless it is to knock down subscribers as don't pay for their paper. I suppose there are plenty of such mean people." That boy stands a chance for the Presidency if he lives.

The Rapidity of Progress toward Health,

Even when a good remedy for disease is selected, depends in some measure upon the manner in which it is taken. Irregular, interrupted doses can afford no fair test of the efficacy of any medicine, however salutary. Taken in proper doses at prescribed intervals, a reliable curative will effect the object of its use. Among remedies which, systematically and persistently used, accomplish thorough and lasting cures, and prevents the recurrence of periodic disease, Hostetter's Stomach Bitters ranks specially high. In cases of dyspepsia, debility, rheumatism, fever and ague, liver complaint, inactivity of the kidneys and bladder, constipation and other organic maladies, it is a tried remedy, to which the medical brotherhood have lent their professional sanction, and which as a tonic, alterative and household specific for disorders of the stomach, liver and bowels has an unbounded popularity.

THE VIBRATOR HARROW.



Best Harrow made. Cuts every inch of ground, & adapted to all kinds of soil. Peculiar shape of tooth makes it easy of draft and leaves the ground light and mellow. Relieves itself of all obstructions. Bundled very compact for shipment. 3 sizes cut 6, 8, and 10 ft. Agents wanted. Write for Circulars to
PHELPS & BIGELOW WIND MILL Co., Kalamazoo, Michigan.

For Sale.

One of the best Stock Farms, of 720 acres, in South-Eastern Kansas. An abundance of good water and timber, and good buildings. Inquire of
JAS. J. DAVIS. EVERETT, Woodson Co., Kan.

YOU SURPRISE ME with your liberal offer! Nevertheless we will send you a "gem of an autograph album" of 40 pages and a book of 300 choice selections, all for 7 three-cent stamps. As to our reliability, inquire of this paper. Address
BURT & PRENTICE, 46 Beekman St., New York.

SEEDS Illustrated GARDEN GUIDE, of the best Flowers and Vegetables, with prices of Seeds, and how to grow them. FREE TO ALL. *It will pay to send for it.*

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

Vol. XL. No. 5. Whole No. 1618. | NEW YORK, JAN. 29, 1881. | Price Five Cents. $2.00 Per Year.

[Entered according to Act of Congress, in the year 1881, by the Rural New-Yorker, in the office of the Librarian of Congress at Washington.]

The Herdsman.

OUR ANIMAL PORTRAITS.

Imported Holstein Bull "Ebbo"—The Property of Messrs. Smiths & Powell, Syracuse, N. Y.

We present to our readers this week an accurate copy of a photograph, taken for the Rural at the Albany Fair Grounds, of Messrs. Smiths & Powell's superb two-year-old bull "Ebbo," which won for them the first prize in his class.

"Ebbo" is a black and-white bull, two years old in April, 1878, of excellent form and majestic size, a fine handler, and in every way a most attractive and promising animal.

He was imported from North Holland by George C. Brown in his dam, which proved a superior milker. He is fine in bone, with a remarkably small head, excellent escutcheon, and will prove, we have no doubt, very valuable as a getter of milch stock, and in this class he most creditably upheld the credit of the herd, of which we gave a somewhat extended notice on page 816 of last year's volume.

NOTES BY A STOCKMAN.

It is certainly very curious to see how much reasonable men may be blinded by prejudice. One may get a very clear idea of this failing in a few minutes' talk with a lawyer. The client, filled full of the justice of his case, as it appears to himself, is nettled when his lawyer quietly says to him:—"But, my dear sir, the other side feels and talks just as you do. The Court is just as likely to take his views of the facts and the law as to take yours." And this is the delightful uncertainty of both law and facts.

And this applies very pertinently to those persons who so fiercely decry close breeding and who declare that it ruins the stock. The same charge has been made against Mr. Booth as against Mr. Bates, and the system practiced by the former was precisely the same as that of the latter. But the whole force of the objection seems to be thrown upon the Duchesses. Well, they can stand it.

A neighbor who was reading these notes in the Rural of January 8th (ignorant, however, of the authorship), in discussing it with me takes a peculiar view of it. I remarked to him that from the accepted belief in the origin of the human race we must admit that even this was closely bred at the start. "Well, yes, I suppose it was; Cain and Abel married their sisters, I expect." But, with a joyous twinkle in his eye, he remarked:—"But the breeding was bad, for Cain killed his brother, and even now see what a bad lot we are, and how the bad blood breaks out." I commend this reasoning to my adversaries.

The Agricultural Gazette, of London, is amused at a note of mine in regard to the possibility of American breeders producing as good Jerseys as can be imported. It quotes the note with evident relish as a specimen of what may appear to an Englishman as American brag. Well, we have something to fall back on. We have more good Jerseys here than are in the Island of Jersey; we have more Short-horns than are in England, and English breeders have paid us larger prices for our animals than were ever paid in England; we have the best Merinos in the world; our horses have beaten the English racers on their own turf; no other trotting horses can approach the American-bred horses. England has 5,912,000 horned cattle in all, and 26,619,000 sheep, while we have more than 13,000,000 milch cows and over 21,000,000 of beeves, and nearly 41,000,000 sheep; not to mention 34,000,000 hogs, 11,200,000 horses and nearly 2,000,000 mules. There are nearly as many horned cattle in Texas as in all Great Britain—England, Scotland, Ireland and Wales united.

With all this raw material, and as good, pure animals as exist anywhere and as skillful and intelligent breeders, why should not America become the first in regard to excellence of type and quality of live stock; and why should it be continually neglecting its own opportunities and employing other breeders to do the work which can be done at home as well, or better?

There is always a good reason for "the milk in the cocoanut." I quote from the Agricultural Gazette in another place: "Nobody opens his purse so freely as Brother Jonathan when he has a mind to buy." This is a fact, and Americans are too good customers to foreign breeders to be lost; and so they are "amused" to hear an American say that as good animals can be bred in America as in the Island of Jersey or elsewhere.

England has been the mother of nations. But when a man sets up for himself he cuts loose from his mother. We have cut loose from our mother country and set up in business for ourselves. We have even gone into competition with the old lady, who shakes her curls and her frills at us as we take her customers from her. Nay, the old lady is forced to come to our shop to buy her bread and cheese and bacon and beef, or a good portion of them, and is glad to get even by selling us her high-bred cattle and sheep. As long as the delusion exists that we have not as good of our own and cannot produce more than we need, and may not even sell some that we can spare, we shall go on throwing away our money which we could just as well put into the pockets of our own breeders.

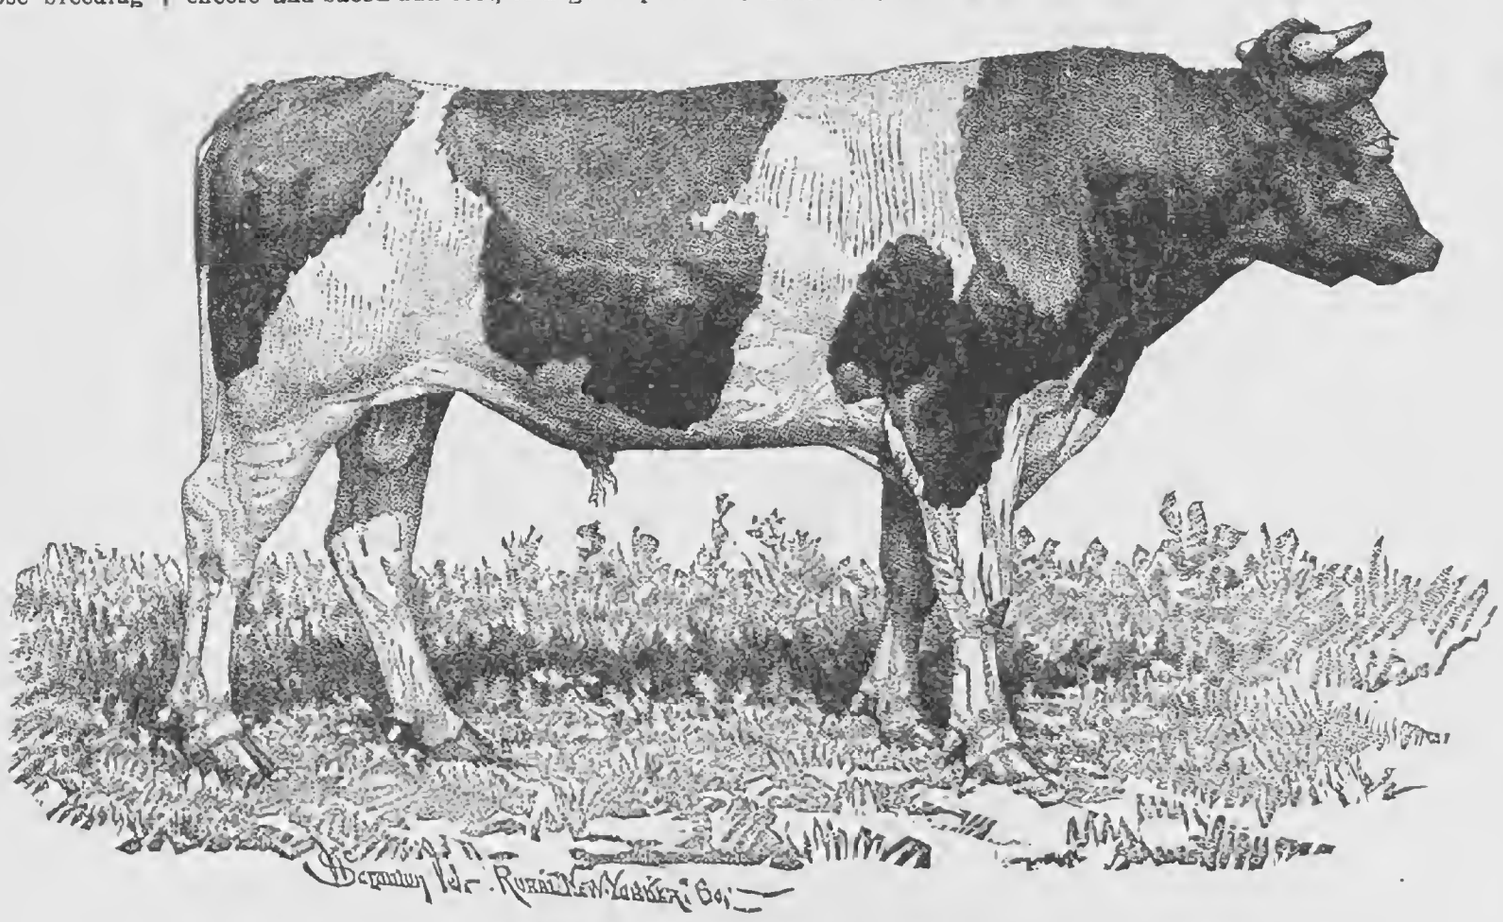
There has been an evident effort of late to give a boom to foreign cattle. The cablegrams that come to the daily newspapers are even enlisted in the work. There lately appeared among the items of important news a statement that some Jerseys had recently been bought in the island for an American breeder at unprecedented prices—$1,500 each was named. But there are cows here that could not be bought for twice that sum.

Is the money value, then, the measure of the real value? If it is in one case as in the other, then I was right, and we have better cattle here than in Jersey, for I think I could lay my hand on a dozen cows that could not be purchased for $1,500 each, and this sum is by no means an unprecedented price here. By-and-by we shall be exporting Jerseys. I prognosticate that, although that respected journal, the Agricultural Gazette, may be "amused" by it.

Large Importation of Thoroughbred Horses and Jersey Cattle.

On the 9th the steamship France arrived at this port having on board 40 thoroughbred horses, mares and colts, and 12 head of Jersey cattle. The horses, we understand, were all on consignment. 15 having been shipped for sale here by Mr. Cowie, three of which died of disease, not accident, during the voyage; while the remaining 28 were sent out by Mr. E. Tattersall. The Jerseys were also bred by him near London and sent hither for sale. The following is a list of them:

Name.	Sire.	Dam.
Mrs. Elmer, heifer	Highfield	Busy Body.
Young Bridesmaid, heifer	Highfield	Bridesmaid.
Molecule, heifer	Highfield	Mole.
Quadrille, heifer	Metadore	Old Cow.
Chrysalis, heifer	Highfield	Moth.
Eugenie, heifer	Metadore	Napp 2d.
Darkie, heifer	Metadore	Black faced heifer by Highfield
Iodine, heifer	Metadore	Blister
Paul Pry, bull	Brown Bread	Busy Body.
Basingstoke	Mr. Pain's Young Napp	Red Cow.
Molehill, bull	Metadore	Mole.
Bitter Beer, bull	Metadore	Bitter Girl.



IMPORTED HOLSTEIN BULL, "EBBO."—From Life.—Fig. 36.

Signs.—In the Ohio Farmer of December 4th, Mr. Stephen Powers, referring to "signs," asks whether lambs castrated at certain phases of the moon do not bleed more than if the operation is performed at other times in the month. I answer, "No." I have castrated hundreds, and done so at all times, and I have never found any difference in the amount they bleed at any of the various phases of the moon. Some bleed more than others at all times, at what are considered "favorable times" as well as at unlucky ones. Last season I went to a neighbor's to trim his lambs, and was told that they would all die—the sign was in the heart, and so they were fated. So it was; but I don't go by signs, so the job was done. My neighbor says that he never had any lambs that did better. R. Greenbank.

Stark Co., Ohio.

The Swine-Herd.

AN EXPERIMENT TO CHEAPEN THE PRODUCTION OF PORK.

Col. F. D. Curtis.

During the past year we tried an experiment to determine whether pork could be produced on a considerable scale at cheaper rates than those at which we had been in the habit of making it. Pigs are in this section of the country usually wintered on corn and summered on milk, kitchen slops and corn. Sometimes they are allowed to run in the pasture and this feed is supplemented with corn. Corn is the great staple food of pigs.

We have been satisfied for years that on the above basis there was no profit for us in making pork; hence we have given the subject considerable study with a view to devise some plan to cheapen production. The foundation of our plan is a warm pig-house—so warm that when the pigs are in it, it does not freeze. Here the breeding sows are wintered on raw roots, which are the cheapest feed we have any knowledge of. The roots are stored in the cellar underneath, where they are handy, as labor is an important item and must be reduced as much as possible. The sows are allowed to have their young the last of April or the first of May, as we calculate that as soon as the pigs are old enough to be turned with the herd they and the mother may be put out in the pasture.

Last Summer we had a clover pasture for our pigs into which they were turned, young and old, the former when from three to four weeks of age, or as soon as the clover was up large enough for a good bite. In this field there was a spring of water where the pigs could drink and a shed into which they could go during the warm part of the day for shelter, or at night. The old hogs were not fed anything, but the pigs were taught to come into an inclosure in which corn was given to them three times a day. At first they ate but a few kernels each, but the quantity was increased as they grew older, until they consumed a quart a day. By this time—the middle of August—a patch of sweet corn, planted for the purpose, was ready to be cut up for feeding. A quantity was cut twice a day, as much as the herd would eat up clean, and strewn about the fields. A severe drought had diminished the growth of the clover, so that the sweet corn did not add to their growth as much as we had intended. We expected it to serve as extra feed over and above a good supply of clover; but, instead of this, it was comparatively all the feed which they had for a month. This corn had been planted in drills and sufficiently scattered so that most of the stalks contained small ears. The crop averaged seven feet in hight, and, notwithstanding its rankness, it

was all eaten up. The feeding began as soon as the corn was in the milk, which was its sweetest stage.

When the sweet corn was exhausted we had a crop of Early Amber Sugar-cane for feeding, which was cut up and scattered in the pasture. The pigs ate this with as much avidity as they had the sweet corn. The sugar-cane was a splendid crop, and a quarter of an acre fed all our pigs for fully three weeks. At the end of this time the whole herd, 138 (we had sold 25), were turned into the orchard to eat the fallen apples and to forage upon a crop of mangels which had been grown in that field. Here they remained until the roots were gathered—the first of November—when they were turned into the root field to eat the leaves and refuse roots and a patch of two acres of turnips which had been put in expressly for them. This field furnished food for that portion of the herd which remained in it until Winter set in. At the middle of November the larger pigs were taken out and shut up by themselves, and fed all the boiled corn they would eat. The old hogs were left in the root field until the first of December, when they were also shut up and fed boiled corn. Among these were a number of breeding sows which we desired to turn off, which had been suckled down very thin during the Summer, as they averaged eight pigs each. When taken from the turnip field these animals were in fine condition, having made their entire growth without a single particle of grain. After being fed corn for three weeks they were slaughtered. The pigs were fed a month, when they were slaughtered, and ranged in weight from 100 to 150 pounds. We hold that it will not pay for us both to raise and fatten pigs on corn. But it will pay to raise pigs on cheaper food and finish off on corn.

The roots left our pigs in good growing condition. They had the bodies, bone, and constitutions to eat and digest and assimilate a good deal of corn in a short time. As soon as they were fat enough to butcher, without being excessively so, they were killed. The flavor and character of the meat were perfect. Under our system of feeding and fattening there could be no feverish condition of the animal, for it was not fed long enough, and with the range the herd were given during the period of growth, with only spring water to drink, and the wholesome and fresh vegetable food which they had, coupled with the exercise and pure air which they always breathed, their condition could be no other than perfect for human food.

We are satisfied that this system of raising pigs will develop more lean meat, and hence make them more desirable for human food, than the usual custom of confining in close pens when there is a much larger proportion of fat (blubber), which is not so much in demand for food as formerly, and which is not desirable. The drought made our crop of sugar beets and mangels both backward and limited, or else we should have begun to feed them the first of September by carting a load daily into the clover field. If we could have spared these roots, they would have lessened considerably the quantity of corn required to put the pigs in condition. It was a part of our plan to feed roots during the whole of the Autumn and not feed corn more than ten days, but the want of plentiful pasture and roots kept the hogs so much leaner than we intended that it took twice the amount of corn to put them in condition which it would have done had the season and growth been an average one. Our sows all bore large litters of healthy pigs, and they were free from disease the entire season.

There is economy in the production of succulent foods, such as corn-stalks, sugar-cane and roots. Our corn-stalks and sugar-cane were hoed only once, although frequently cultivated, and the cost of these crops was but a trifle as compared with that of a regular crop of corn. These crops may be economically used to make the growth of animals and to put them in good condition, which plenty of beets will make certain, and then they may be topped off profitably with a little corn.

Dairy Husbandry.

THE DAIRY COW—NO. 33.

HENRY STEWART.

Butter Preservatives.

As fresh butter is a very perishable product, and to a large extent in both small and large dairies is required to be preserved in good condition for lengthened periods, the methods of preserving it are worthy of notice. At the outset it is necessary to utter a caution against all the so-called butter powders which are offered for sale and pressed upon public notice as agents for increasing the quantity of butter as well as for preserving it. Some of these deserve to be called frauds, for they are not what they are set forth to be, and the stuff produced by them is not butter, but a mixture of butter and curd made by means of alum, saleratus and other similar substances, with sufficient coloring matter to give it some appearance of butter. But it is not butter by any means, and can only be disposed of by false representations. As a matter of course, no person would make such stuff for his own use; but many might be deceived by the delusive advertisements into purchasing and trying these butter powders to their own disappointment and injury. As a general rule, all these mixtures by which the quantity of the butter is proposed to be increased, may be considered as injurious, because the butter cannot be increased in any manner whatever, except by the addition of milk, curd or water, and any one of these is hurtful to the butter, and to the extent that the additional weight and bulk are not butter, it is a deceit and a fraud.

Salt as a Preservative.

The action of salt in preserving butter is due to its antiseptic properties. Butter is composed of several substances, and contains, when as nearly pure as may be, some remaining milk, or caseine which is known to have the property of converting sugar into lactic acid, and is also strongly suspected of inducing chemical changes in the pure fat of the butter itself. This conversion of the sugar of milk contained in the butter, has the effect of setting up a fermentation in the latter by which carbonic acid and hydrogen gases are given off and butyric acid is produced. The chemical change by which lactic acid is transformed into butyric acid may be expressed in the following manner:—

The formula by which lactic acid is expressed chemically is	C6	H12	O6
Butyric acid	C8	H16	O4
Therefore			
4 atoms of lactic acid	= C24	H48	O24
3 atoms of butyric acid	= C24	H48	O12

All that is required to transform four atoms of lactic acid into three of butyric acid is to take oxygen from the former to the extent of one-half. Without going into intricate formulæ to express the results of the change by which this abstraction of oxygen is effected, it may be necessary only to say that in the escape of the carbonic acid and hydrogen above mentioned as being given off in the production of the butyric acid, 1½ atom of lactic acid may combine with these twelve atoms of oxygen forming nine of carbonic acid; twelve of hydrogen and three of water; the carbonic acid and hydrogen escaping as gases, the water remaining in the butter, and the oxygen, freed from the 1½ part of the lactic acid, combining with four other parts, enables these to be transformed into three parts of butyric acid.

The butyric acid thus produced is a colorless, transparent, volatile liquid which emits an odor of vinegar and rancidity. Its presence even in a very small quantity gives to the butter a well known undesirable odor, and in larger quantities the offensive scent and taste of rancidity. To the impossibility of preventing this transformation, to some extent, with lapse of time, even in the very best made butter, is due the peculiar scent of the butter after having been kept a few days only, which, however, may exist without affecting the flavor. To prevent the chemical changes above noted, it is necessary to make use of some anti-ferment or antiseptic, and to pack the butter as soon as possible in such a manner that it may be preserved from contact with the air. Salt is the commonest substance used for this purpose. But it is only most effective when it is pure chloride of sodium, and reduced to extreme fineness of division. Salt often contains some salts of lime and magnesia, and these in their direct action give a bitter flavor to butter, which is quite appreciable to an expert; and in their decomposition, may easily assist in producing the chemical changes above referred to. To use only pure salt in its most soluble state, that is, ground as fine as possible, is indispensable; for the salt exerts no preservative effect until it is dissolved and then only in proportion as it is intimately diffused through the mass of the butter.

Other Preservatives for Butter.

Saltpeter, sugar, borax, and some preparations of borax have been and are used in packing butter. Saltpeter and sugar are both antiseptics and add an agreeable flavor to butter. On this account they are used with salt to repack butter that has been badly packed at first, or to mix with inferior and poorly made butter as a means of disguising its bad qualities. They are really for the use of the poor dairyman or for the professional packer of "store-butter," who gathers from all sources butter of all qualities of badness and repacks it for sale. For this purpose, one part of saltpeter and one part of white sugar finely powdered are added to four parts of salt, and an ounce and a quarter of the mixture is used with each pound of butter previously well washed with pure water.

The use of borax in dairying is somewhat new. There is no doubt that this salt—borate of soda, which is a combination of 36.58 per cent. of boracic acid, with 16 25 per cent. of soda, and 47.17 per cent. of water—is an excellent antiseptic; but its effect upon the human system is said to be injurious. Some experiments have been made in Europe with borax as a butter preservative with no positive ill results; and it seems that its suspected disadvantages may, after all, be more fancied than real. It has been used as a substitute for salt in the usual quantity, viz., about six per cent., having first been freed from the water of crystallization by heating it on an iron plate and then reducing it to a fine powder.

Several other butter preservatives are in the market and are offered to dairymen. Of these one known as glacialine is a powder, the base of which is probably borax. Another is a liquid used by the Aylesbury Dairy Company of England in their business, and is said to be an excellent substitute for salt. A trial with this preparation has so far been satisfactory, a pail of butter packed with it, after five months being in unusually good condition, and the butter having no objectionable qualities. Certainly, the butter seems to keep better than with salt under the same circumstances. One liquid ounce of the preparation is used for 16 pounds of butter along with one-fourth of the usual quantity of salt. The liquid is first thoroughly well incorporated with the butter spread out upon a slab or the bowl and roughly indented with the ladle, the indentations being then closed over carefully to prevent escape of the liquid, and salt at the rate of one ounce to four pounds being then added and the whole well mixed. Butter so prepared is said to keep perfectly well even when exposed to the air.

Field Crops.

EXPERIENCE WITH AN ACRE OF POTATOES.

IRA J. BLACKWELL.

Here I give the results from one acre of potatoes planted the past season with different varieties. All were planted about the middle of April on the same day in soil that was in good condition. About eight loads of barn-yard manure were applied broadcast and 600 pounds of Mapes's Potato Manure were sown in the furrow with the seed at the time of planting. At the first working, after the potatoes had come up, 200 pounds of the same manure were sown broadcast and cultivated in with an ordinary one-horse cultivator. The land had been used for corn the previous year. The potatoes were planted about four inches deep every third furrow after the first plowing. The ground was rolled and harrowed twice before the potatoes came up. When about two inches high the vines were plowed under and covered about three inches deep. Next day we harrowed across the rows once; after which we cultivated once and then plowed to the row once. About one-third of the patch was cultivated after the potatoes had begun to set. No hoe was used at any time, but the ground was kept clear of weeds. Next to the hedge, which injured them to some extent, was the first of the following varieties; the others followed in order:

	Rows.	Yield. Bush.
Early Vermont	5	12
Trophy	1	4
Surprise	⅔	3
Superior	⅔	1⅓
King of the Earlies	10	44⅔
Centennial	⅓	⅔
Beauty of Hebron	⅔	4
Early Vermont	6	29
Burbank's, or White Rose	4	24
Early Ohio	2	5
Brownell's Beauty	1	3
St. Patrick	⅔	3
Bliss's Triumph	1	2
Dunmore	1⅓	7⅓
Peachblow, Bliss's Improved	1	3
	35	134

The six rows of Early Vermont, yielding 29 bushels, were planted for Early Rose, but turned out to be Early Vermont.

Trophy—Medium-sized seed; ripens about two weeks after Early Rose; a strong grower; a handsome tuber; rotted considerably last year; a good cropper; quality fair to good.

Surprise—Seed medium to large; ripens about 20 days after Early Rose; color almost black; vines strong; a straggling grower; quality superior, boiling very white and nice. Bad as regards the "bugs" on account of the vines spreading so much.

Superior—Unless this is better elsewhere than it is with us, it is not worth planting.

King of the Earlies—Seed medium-sized; ripens about a week earlier than Early Rose; keeps well; quality good. Early Vermont is a few days earlier than the King of the Earlies.

Centennial has never been productive for us—seed small or medium.

Beauty of Hebron—The seed was produced from seed sent out by the Rural. The four bushels are the second year's crop from six ounces of seed. The yield was very poor the first year on account of the dry weather and moles or mice. This potato is second early, or with the Early Rose; quality good—one of the promising potatoes.

Burbank—Medium to large seed; a very strong grower; tubers large and tolerably smooth; quality medium to fair; ripens about two weeks after Early Rose—a promising variety.

Early Ohio—Medium to large seed; a very weak grower, top seldom a foot high; quality superior; potatoes run smooth and even-sized; ripened 3d of August, or three weeks ahead of Early Rose.

Brownell's Beauty—Medium-sized seed; formerly our most productive potato; it is now growing rough, comes up poorly, and about nine plants out of every ten are unhealthy; quality best; looks now as if it would have to be abandoned.

St. Patrick—Seed extra-fine; a great grower; ripens about two weeks later than Early Rose; quality good, cooking dry and mealy.

Bliss's Triumph—Medium-sized seed; a weak grower; ripens with Early Ohio; quality not so good.

Dunmore—Medium to large seed planted; a strong grower: ripens about two weeks later than Early Rose; a large, white potato of fair quality—an improvement on the Peerless.

Peachblow (Bliss's Improved)—Medium seed planted without cutting; crop all small to medium; they seemed to blight about the time they should grow. This applies to all the varieties of the Peachblow. We raised three bushels from one pound of seed three years ago—all large tubers.

The season was not a good one for potatoes in this section, as May and June were extremely dry, following a wet Spring. Our potatoes were planted on a red shale loam, which was in good condition to work at the time of planting. A heavy rain followed within a day or so, packing the ground pretty hard. Very little rain fell after this until the last of July. It will be seen that the early potatoes had a hard time of it, the soil being comparatively dry until the Ohios and Triumphs were ripening. Following the dry spell we had a deluge that was nearly as bad as the drought, causing the potatoes to make a second growth, particularly injuring the St. Patrick.

Our experience shows that one year's comparison will not be conclusive evidence for or against a potato. For example, the Beauty of Hebron the first year was a failure; this year it is among the most productive and saleable of all the varieties grown. The St. Patrick was in just the right stage to make a second growth when the rains came. Our potatoes are keeping well this year, being quite free of rot. We applied London-purple three times to all of the vines, except the Ohios and Triumphs. The following had four applications: Dunmore, Burbank's, St. Patrick, Peachblow, Surprise, five pounds of the Purple and two pounds of plaster having been used to the acre.

Cost of the Acre of Potatoes.

8 loads of barn-yard manure at $2	$16 00
800 pounds of Mapes's Potato Manure	19 20
12 bushels of seed potatoes at 50c. per bush	6 00
5 pounds London purple at 20c	1 00
1 team one day planting	2 00
3 men one day planting	3 00
Rolling	50
Harrowing twice	1 00
Plowing once	75
Cultivating once	75
Cultivating half the patch once	38
1 team digging 1 day	2 00
4 men digging 1 day	4 00
Interest on land	6 00
To total outlay	$62 58
By 134 bushels of potatoes at 50c	67 00
Net balance	$4 42

Thus there is a clear profit after paying for all the work and for the manure, while the land is left in condition to raise a crop of wheat with very little cost for manure or labor.

Titusville, N. J.

SUPPLEMENTARY NOTES ON THE INDIAN CORN CROP.—No. 1.

B. F. JOHNSON.

Where so much is to be said, and there are so many to say it, as in the Rural Corn Number, it is imperative on every one to be brief, and therefore I withheld the relation of facts and the expression of opinions on the subject, which seem to me to be of value; and they may appear so to others. I confine myself to two sides of the subject this time, viz: What are the best manures and fertilizers for Indian corn? and what weight are we to allow the thoroughbred idea and the prepotency and fertility of some varieties over others?

1. What are the best manures and fertilizers? I answer for the black soil prairie, and for it only, so far as my observation and experience may go. It is notorious, and I think, therefore, it will be generally admitted, that this soil is extravagantly provided with humus when new; has an abundance of it when considerably worn, and that when it has become partially exhausted even, the amount of humus is considerably in excess of that in average soils of the same age outside of the prairie belt. But where humus abounds there is never a lack of nitrogen, and therefore the best manures and fertilizers for the corn crop are not nitrogenous but non-nitrogenous. And the relation of the outcome of certain corn experiments made in the Summer of 1875 will perhaps illustrate and enforce these ideas.

The experiments were undertaken with the object of ascertaining what are the conditions

necessary for growing 100 or more bushels of corn to the acre on prairie soil which had been in cultivation for 20 years, but which within a few years had been tile-drained, manured and cropped. The work was conducted pretty much as follows:—The land was plowed deep some time late in April; harrowed thoroughly a few days before seeding, the first week in May; and the seed—a good variety of large yellow Dent—was drilled in, the rows standing four feet apart and the stalks nine to twelve inches in the row. The Spring of 1875, was cold, backward and dry, and so much out of the common in this last regard, that neither rain nor storms interrupted plowing for the entire month of April. In fact, the great drought which began early in 1874, was not fairly broken till in June the following season. The soil being cold, for the reasons above, the corn on the experimental acre made a poor stand and had to be replanted, and, as is almost always the case, the replanting was far from satisfactory. In the matter of cultivation, the corn was harrowed as soon as the rows could be distinguished, and the cultivator was set to work immediately thereafter, and put through the field two or three times. Meantime, to secure absolute freedom from weeds, they were cut out twice with the hand-hoe just before cultivation. But between the first and second plowing, and when the young corn was about six inches high, a lot of old but unleached ashes was procured from a saw-mill in the neighboring timber, and a full quart was given to each corn stalk.

After a dry, cold Spring followed a cool and very wet Summer, and so great and so continuous was the rainfall during harvest, that the small grain and the hay crops were more than two-thirds lost. But in spite of the advantage of drainage, the experimental patch suffered with all other crops, but never very seriously, except during the heavy and protracted rain and wind storms of the 31st of July and 1st of August, in which six inches of water fell and the wind did immense damage by prostrating the corn in many places. Frost came some time in September and found the experimental crop ready for it. In October the entire crop was husked from the field, weighed on scales near-by, and the corn not being dry enough to be marketable, 80 pounds of ears were allowed to the bushel, and the total crop for the whole acre was found to be 85 bushels and a few pounds.

If the stand had been good in the first place, if the season had been warm and moist, and if the wind and rain storms had not happened, and if the land had been plowed the previous Autumn, it is probable the yield might have been 100 or 110 or even 120 bushels. On the other hand, it is probable if it had not been for the copious and incessant rains of the Summer, the benefit the crop received from the wood ashes would have been very much less, and it is altogether likely that if the Summer had been a hot and dry one, the effects of the ashes would have scarcely showed at all.

There having been a difference of opinion, whether wood ashes or stable manure were the better for the corn crop, another experiment was conducted at the same time in the same way, except that before plowing and in course of the Winter the ground was covered with fully four inches of stable and pig-pen manure, hauled from a town close-by. Though not tile-drained, this field had a nice slope for surface drainage, and a good stand was obtained and the crop was carefully cultivated to the end. The seed in both fields was the same; but while the ashes seemed to dwarf the stalks as to their hight, they enlarged their diameter at the base and increased the size of the ears; while the stable manure appeared to show in the length and stoutness of the stalk and in placing ears out of reach. At harvest the manured field yielded 55 bushels per acre, in face and eyes of the fact that average judges, before husking, thought there would not be a great difference in the yield. It is probable, however, that if the rains had been less heavy and continued, there would have been less stalk and more ear growth in this field and that in the event of a moderately dry season, there would have been less than thirty bushels' difference in the two crops.

If these experiments teach anything in respect to the best manures and fertilizers for corn, it is that where humus abounds, there will be nitrogen and probably organic forms of plant food enough to make sufficient stalk growth, and therefore for the black soil prairies the best fertilizers are those as nearly allied in substance to wood ashes as possible, because they contain every inorganic element the corn crop needs.

Champaign Co., Ill.

EXPERIMENTS IN CORN GROWING.—For my last corn crop I plowed half of a 17-acre field in the Fall and again in the Spring, while the other half was plowed only in Spring. The corn on the land plowed in the Fall and Spring gave a much heavier yield than that on the other portion of the field and looked much better during the whole season. I think a great deal is gained in every way by plowing for corn in this manner. Had my whole field been so treated, my crop would have been from 50 to 60 bushels more than it was.

In applying plaster to the corn, I sowed it on a quarter of the field after I had harrowed it, and on the rest of the field I applied it between the first and second plowing. Applying it at the latter time I find does most good, and returns most profit for one's labor. J. A. H.

Kearneysville, West Va.

COMMENTS ON THE CORN NUMBER.

AFTER getting so thoroughly "corned" as we are, I am not sure that it will be admissible to try and get another "nip." Some one wisely concludes that each farmer must experiment on his own soil, and I judge thousands of valuable experiments will result from the most excellent Corn Number of the RURAL now before me. I suggest that we be more careful in the use of relative terms. B. F. Johnson thinks deep plowing may lessen the chances of a good crop immediately following. In this part of Nebraska there are no reports of a corn crop being injured by deep plowing. But what is deep plowing? C. E. Thorne seems to think no deep plowing is done unless we get down more than 12 or 13 inches. With him 12 inch plowing gave better immediate and remote results than eight-inch plowing. Spring plowing seems to be at a discount. Our farmers do some Fall plowing only because it is feared there will not be time enough to do it in the Spring. We prefer a "fresh seed-bed" for corn, though not for wheat. If this is the greatest error, we must fall to experimenting more carefully. Friend Mason, of Dodge County, is correct in his deep culture, according to the testimony of Nebraska corn raisers.

Professor Roberts says, "Root-pruning in rich soil in moist or wet weather, when growth is very rapid, is apt to be beneficial; in dry, hot weather it is quite apt to be injurious." Just so my Dodge County friend would "root-prune;" would make a deep, mellow soil while it is moist, so that the roots will have a good natural mulching when the dry weather comes.

Here is an experiment of mine:—In '78, after my corn was "laid by," late in July and early in August, I took one horse and a corn plow and passed once in each row for 40 rows, running east and west on the south side of a corn-field. I plowed at least six inches deep, and until compelled to desist by a heavy fall of rain. Late in August a hot wind from the south struck the field. In a few days corn-fields all around me looked as if suddenly ripened; so did mine, save the aforesaid 40 rows. Standing two miles away one could see a green strip on the south side of my field. The south side was most exposed and least injured.

We are advised to "cultivate with cultivator and hoe." We of the West, like Uncle Ned, have "laid down the shovel and the hoe." We can hoe with our horses better than with that implement used by hand and known in the East as a hoe. Our implements are sometimes called horse-hoes, but more frequently corn-plows, because on our deep soil they must go *deep*. R. H. CRANE.

Harlan Co., Neb.

Farm Economy.

FODDER VALUE OF FROZEN POTATOES.

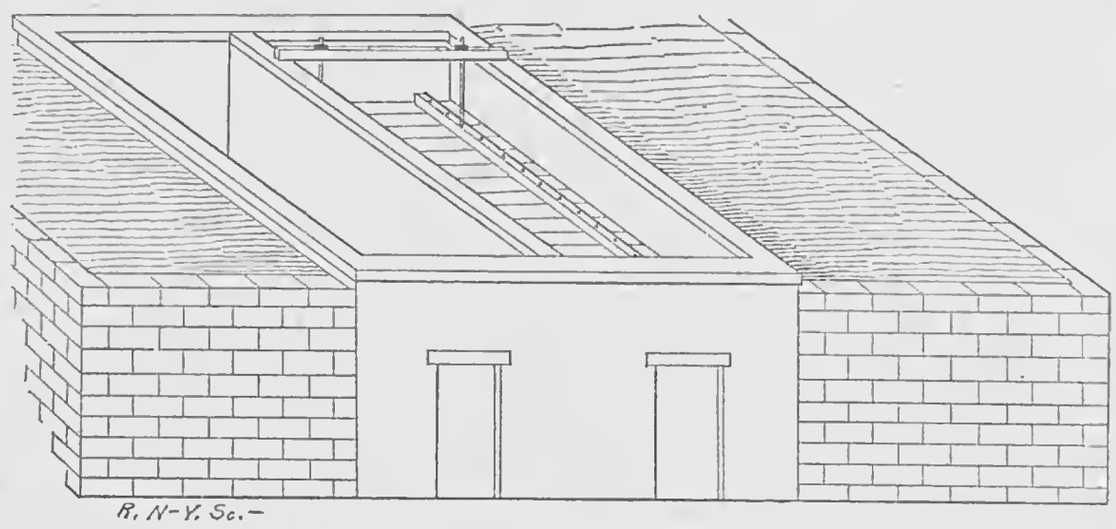
PROFESSOR F. H. STORER

A NOTABLE instance of the comparatively feeble power of vegetable matter to resist fermentation and decay when it has once become disorganized, is exhibited by potatoes which have been frozen and thawed. On the continent of Europe, where large quantities of potatoes are fermented and distilled, it is a matter of practical experience that the amount of spirit obtained from potatoes which are frozen, is scarcely any smaller than that from the sound tubers, provided the frozen potatoes are not allowed to thaw until they have actually been brought to the mashing tubs. But a very different result is obtained in case the frozen tubers are allowed to thaw and are then left to themselves in heaps for a few days, or even for 24 hours, before being subjected to the mashing process. If such delay be permitted, the decrease in the yield of spirit is so great that, as distillers say, there is hardly enough alcohol obtained to pay the excise duty.

Potatoes become wet in thawing, especially if they are lying in heaps, and they soon heat, as the term is; they are then apt to pass quickly into a condition of active decay. The sweet taste which a frozen potato takes on in thawing indicates the beginning of decomposition. In the process of freezing, the cells and tissues of the tubers are lacerated, torn asunder and disorganized; and the starch and other matters which the cells contained are left in such a condition that they react upon one another chemically, and fermentation ensues. As in the germination of barley and other grain, so in the thawed potato one of the first results of this chemical action is the conversion of a large part of the starch of the potatoes into sugar. It was noticed by the chemist Schmidt, that as much as 33 per cent. of the starch in potatoes may be changed to sugar in the process of freezing and thawing; and he found nearly six per cent. of sugar in the sweet juice obtained by squeezing potatoes which had been frozen and thawed. The decay of potatoes is a subsequent process which succeeds the change of the starch to sugar and quickly destroys the latter.

In experiments where starch was made from sound, from frozen, and from thawed potatoes there was obtained 15 3-5 per cent. of starch from the sound tubers, 15 per cent. from frozen potatoes which were thawed at the moment of the experiment, and only nine per cent. from potatoes which had been left for 24 hours in a warm room after thawing; and very much smaller yields of starch than this were obtained from frozen and thawed potatoes which were left lying in heaps until they heated.

From all this chemical evidence it is fair to infer that, apart from the trouble of thawing them, the fodder-value of frozen potatoes is as great as that of the sound tubers. In this view of the matter, boiled frozen potatoes would have the same value for feeding animals as potatoes which were boiled before freezing. Even thawed potatoes must be good fodder when they are fed out immediately after thawing, but they deteriorate rapidly when left to themselves in the thawed condition.



DESIGN FOR FROST-PROOF SILOS.—FIG. 37.

SILOS IN THE COLD NORTH.

T. H. HOSKINS, M. D.

THE success which has followed the experiments made during the past two seasons in the ensilage of green crops for Winter feeding, and the evident value of this preserved fodder to those, especially, who are making a specialty of Winter dairying, have made its general adoption upon the dairy farms of Vermont almost a certainty. The particular problem and difficulty of our latitude is the prevention of freezing, both before and after the silo is opened. I send you herewith a sketch of a pair of silos which it is proposed to build in this neighborhood, and which, it is believed, will solve the problem above referred to in a satisfactory manner.

The location selected is a slope facing south. It is proposed to excavate a pit 32 feet square, at the top of this slope, scraping the dirt down-hill, and building a bank wall in front 20 feet each side of the silos, which are to be floored and lined with brick, and smoothly cemented on the inside. A middle wall of division is also to be built of brick, the silos being each, when finished, 30 by 15 feet square, and 15 feet deep. Against the front of the silos and bank wall the stable or tie-up is to stand, and a framed barn, of which the tie-up will constitute a basement, is to be built over the whole. The silos open upon the feeding floor of the tie-up, directly in front of the cattle, while the wall behind the cattle, facing south, is to be nearly all windows. There will be a manure cellar under the tie-up, and thorough provision for saving all the manure, both liquid and solid. The "lay of the land" enables all this to be done at a minimum of cost.

The peculiarity in the plan of these silos is their thorough protection from frost, both before and after they are opened. This it is proposed to effect as follows:—After the silo is filled (having been firmly trodden, allowed to settle, and then refilled, according to the plan of Mr. O. B. Potter), previously prepared planks, three by eight inches in size, planed and jointed, with dowel-pins on one edge and corresponding holes upon the other, are laid upon the carefully leveled ensilage. If necessary, to get a smooth surface, it is proposed to spread a thin layer of long straw lengthwise over the ensilage. Each plank will have, at one foot from each end, a slot cut through it in the middle to admit a 10-inch bolt, the edges of the slot being counter-sunk on the under side to admit and hold the head of the bolt. When the planks are all laid down, (the dowel-pins in the edge of each being carefully entered in the corresponding holes of its neighbor, but not driven up very closely) beams, say four by six inches in size, with corresponding slots, are dropped over the ends of the bolts, and nuts with washers applied to draw them together, though not too tightly at first. Slots, instead of round holes, are made in both planks and beams so as to allow for the swelling of the planks; and for the same reason the planks are not to be driven closely together. The beams may be in sections, according to the length of the silo. The planks are then weighted, and it is proposed to use for the purpose either bags of sand or hard-wood logs sawn to convenient lengths for handling. In preparing the beams two long bolts with either an eye or a hook upon their upper ends are inserted in each beam, about a foot from each end. After the contents of the silo have settled all they will, and just before the coming on of severe cold, timbers are laid across the silo above the long suspensory bolts previously inserted in the longitudinal beams attached to the planks, and linked rods are used to suspend the continuous plank covering to these timbers. The space produced by the settling of the ensilage is then filled with chaff, sawdust, or any suitable non-conducting material.

It is easy to be seen that with a set of silos thus constructed the contents can all be fed out through the doors opening into the tie-up, the suspended planking above, with its packing of sawdust or chaff, remaining as a frost-proof ceiling. When the silos are emptied the packing may be removed, the planks detached by loosening the bolts, and the whole covering with its suspending timbers taken off for refilling. It is intended to remove the weights at the time of putting in the suspensory rods. It is also proposed to put in a movable floor over the silos, and use the building overhead for the storage of hay, straw, etc.

Orleans Co., Vt.

Farm Topics.

SEASONABLE FARM NOTES.

COAL ASHES AS MANURE. It is often a question as to which is the best way of disposing of coal ashes. Their manurial value, unmixed with other matter, is very slight, as has been shown by competent scientific experimenters. This does not prove, however, that they are altogether worthless or injurious when applied to the soil, as many people suppose. On the contrary, coal ashes have been found to work positive benefit when applied to certain soils. The advantages derived from their use do not come from the manurial qualities of the ashes so much as from the mechanical effect which they have upon the soil. I have found them most valuable when applied to heavy clay soils which are liable to bake or become lumpy. When used on such soil, their use renders the soil much more loose and friable, making it easier to work and in better condition for the production of most crops. But I have found a still better use for coal ashes, or rather a way of using them which makes them still more valuable as a fertilizer. Let them be thrown in a heap convenient to the house, and let the slops from the house be applied to the heap. The ashes should be slightly spread, so that the slops, as they are thrown upon the heap, will all be absorbed by them. In the Spring let them be applied to the garden or field, and their use will prove of decided value. There should always be a convenient place to deposit house slop, and if that place is the coal-ash pile, both the ashes and the slops will be turned to good account when applied to the soil. Coal ashes are useful for mulching young trees and bushes. They prevent the soil from drying out, and keep down grass and weeds.

ECONOMY IN THE CELLAR.—In the majority of cellars there has been stored for family use, for feeding domestic animals, or for future marketing, a quantity of fruits and vegetables, such as apples, turnips, beets, pumpkins, etc. A certain portion of these fruits and roots, will, during the Winter, commence to decay, especially if the condition of the cellar is not favorable for keeping them. Another portion will be found, upon assorting them over, to be

unfit for market or for table use. These affected or infirm specimens should not be allowed to remain in the cellar to pollute the air in rooms above with noxious odors, but they should be turned to good account by feeding them to stock.

MANURE.—Winter is the season for making and saving manure. There is no more cheap or convenient way of increasing the manure supply than by the use of an abundance of absorbents. It has been repeatedly proven that the liquid voidings of stock are nearly equal to the solid in manurial value, and yet we find in the majority of barn-yards, the larger portion of them wasted from neglect to use sufficient absorbing material. I prefer straw as an absorbent for general use. It should be used in abundance in both stable and barn-yard. Keep the barn-yard clean and dry by frequently littering it with dry straw. This will make it more comfortable for the stock, and add largely to the quality and quantity of the manure. G. A. G., JR

Elmira, N. Y.

Horticultural.

RURALISMS.

THE editor on page 24, gives some excellent and timely advice to farmers in regard to setting apart an acre or so for fruit, and how a selection should be made. One very important item of advice, however, is overlooked, and one that the editor is as familiar with as anybody can be. After consulting the best catalogues, and getting the advice of your neighbors as to the kinds best suited to your locality, the most difficult thing of all remains to be done, and that is, to get the kinds you want true to name. My advice is, avoid the tree peddler as you would a den of rattlesnakes. Do not be allured by his fine pictures and glib tongue. Dealing with him, the chances are that you will not get more than two trees in ten of the kinds you want, and all are likely to be the refuse of some nursery lately cleaned up (or out.) If the trees should happen to grow, imagine your feelings at the end of eight or ten years, when you find that you have not only not got what you wanted, but instead kinds that are quite worthless to you. You have been robbed of ten (yes, twenty) years of precious life that can never be renewed. This has happened to thousands, and prevented the planting of fruit trees to a very considerable extent. Send your order to a reputable nurseryman, and request him not to substitute other kinds for those you have named, and the chances are altogether in favor of your getting healthy young trees, and all true to name.

I like Kit's protest against stooks, and the introduction of foreign terms when we already have those that answer the purpose, with the advantage of being understood by everybody. Many so-called Americanisms are pointed and expressive, and have as good grammatical forms as most of the foreign terms. Moreover, it is at least in bad taste to multiply terms to express the same thing. If the foreign term, however, is really better, let us adopt it; otherwise let us keep to our own. I "go in" for the best of everything.

A new carnation was shown me a few days since with which I was very much pleased. It is a seedling belonging to the tree or perpetual blooming class, and was raised by Mr. John Reid, who has given a good deal of attention to this class of plants. It has been named Firebraud. The flower is large, very full, of excellent form, of a bright scarlet in color; a color much needed in this class. The buds were abundant on all the shoots, showing it to be a free blooomer. It is to be hoped that Mr. Reid will place the plant in the hands of some florist for distribution. It is too good to be kept private.

I want to suggest another plant for the RURAL'S list of shrubs. I allude to Styrax Japonica, introduced a few years since from Japan, where it has the common name of Snowflake tree, on account of the appearance it presents when in bloom. I have grown it three years, starting with a plant two inches high, and it has thus far proved to be hardy. It has small foliage, is very symmetrical in growth, and makes a pretty tree-like shrub, growing about four feet high. Mr. Thomas Hogg informed me that there is another species of Styrax growing in Japan much larger than this, and even finer in its bloom; but I have forgotten the name. I would suggest that the soil for this Styrax be not enriched.

A very good plant for the RURAL'S shrub list is the Climbing Hydrangea (Schizophragma hydrangeoides). This is another recent introduction from Japan, and I have found it to be quite hardy. The best place for it is at the foot of some rough-barked tree, and I know of none better than the Elm. The plant is thickly furnished with air roots, and it clings to the bark like an ivy. It will also grow on a brick or stone wall or house; and it will handsomely carpet the ground or rocks, but in this case the flowers will not show well. A tree, however, is the most suitable object upon which to grow it; moreover, it will grow very much faster upon a tree than it will trailing the ground. The flowers are about the size of those of the common hydrangea, and resemble them very closely. I consider it a valuable acquisition, and worthy of wide distribution. It should go on the RURAL'S list, since we have comparatively few ornamental plants that will climb and cling at the same time. The young shoots being fastened in their place on the tree, they will thereafter take care of themselves.

HORTICOLA.

[Horticola is possibly not aware that the RURAL presented, Feb. 15, 1879, a portrait of this vine, the first published in this country, with very full notes regarding it. It has since been growing at the Rural Grounds, but we cannot say that we prize it as highly as he does.—EDS.]

IN our "want" column will be found a call for a gardener. We know this to be an unusually desirable one, especially for a young man who desires to educate himself in Botany and Entomology.

Scientific and Useful.

AN ATMOSPHERIC PHENOMENON.

ONE of the most beautiful astronomical phenomena ever seen in this latitude was witnessed December 31, 1880. Just before the sun arose above the horizon there appeared four sun-dogs, two north and two south, rivaling it in brightness. The sky was clear, but the air was filled with frozen mist that sparkled like diamonds. About 10 A. M. there appeared a circle around the sun, the outer edge a spectrum, and the circle divided into four parts by light bands. East and west of

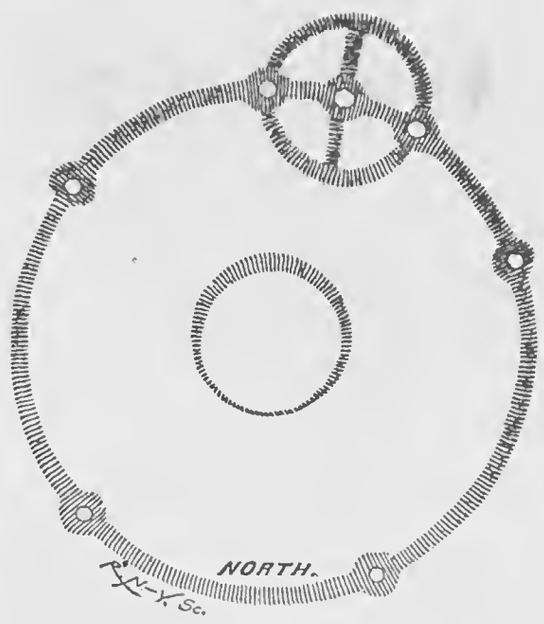


FIG. 38.

the sun, at the intersection of band and rim of circle, were sun-dogs. From these extended a luminous belt encircling the heavens about 30 degrees above the horizon, and on this circle were four other sun-dogs, the two farthest from the sun being the brightest. In the zenith there appeared a beautiful solar spectrum in the form of a crescent, though a faint luminous line completed the circle. The accompanying rough diagram will give a better idea than words of the wonderful sight. With the back to the north, imagine this suspended a vast distance overhead. It will show three circles, one around the sun divided into quarters, a grand circle enclosing two-thirds of the visible heavens, a magnificent rain-bow in the zenith, and six sun-dogs. This grand display lasted about three hours. C. C. CONE.

Chilton, Calumet Co., Wis.

The Poultry Yard.

YOUNG CHICKS IN WINTER.

L. S. HARDIN.

I HAVE always been a constant and diligent reader of poultry journals and of books, pamphlets, standards and other printed matter made up in the interest of breeding fowls; but, after all is told, how little real, true information can be gathered from these sources! To be sure, all that is pleasant and bright and of a seductive nature about the business; all that will lead the unsophisticated to embark in the charming industry, is told in glowing terms. But when it comes down to the real facts, hard labor and unprofitable returns, we hear never a word; nor do we of the dirt, disease and innumerable deaths in the flock of the average breeder; nor of low prices when he wants to sell, and extravagant rates for feed that he must buy. But all this, true as it is, is not what I started out to complain of.

It was always a wonder with me why chicks were not raised all the year round, Winter as well as Summer, and, as I could gain no information on the matter from the books and papers, I determined to find out for myself, so I started that incubator in the Fall and was getting along finely, with everything flourishing, until the "blizzard," or cold wave, struck us, when the hottest fire in my stove failed to keep the temperature of the chicken-room above 70 degrees, and the low temperature had a marked effect upon the chicks. As the cold weather continued, though the thermometer never reached the freezing point and the room was comfortably warm in the day-time and nearly all night, yet almost every one of the chicks, from the oldest to the youngest, was attacked with leg weakness—cramp or rheumatism, whichever it may have been There was no sign of sickness among them, their appetites remaining good as long as they could creep to the feeding-dish; but as the weaklings were run over and trodden upon by the other chicks and injured at night, they were sure to die in a week or two. The trouble was not confined to the older ones, but attacked all alike, even those only two or three days old. Out of more than 100 chicks probably not one dozen were free from this trouble when I concluded to close out the experiment and took their heads off only in anticipation of their early death by the slower action of the weather. Many of them had attained market size and proved of the finest quality for broilers for our own table, but I did not choose to start a market reputation with stock not free from every blemish. Then again, while the incubator was turning out chicks every day, the cold weather had nearly frozen the hens up, so that it was next to impossible to procure eggs at all, and for those that could be got the exorbitant price of 40 cents a dozen was asked, and as it required three of them to make a chick, and that chick was sure to die of rheumatism, I concluded to hold over for warmer weather. With my experience, I am satisfied chicks cannot be raised in an atmosphere that is allowed for any length of time to remain below 70 degrees, and I should want it most of the time about 75. In support of this opinion, I may say that I have looked into the management of a man who tried to raise Winter broilers several years ago in this neighborhood. He used a hot-house, with sash over manure beds for runs, and in this way raised the young chicks as he would tender plants. He abandoned the business because it was so hard to procure enough sitting hens. That was before incubators had been perfected.

The question was, of course, raised in my mind whether the trouble with my chicks did not come from the incubator, as has often been claimed. Fortunately for my case, only a few doors from me the experience with chicks hatched and brought up by a hen was the same as my own with chickens hatched by an incubator and fostered by the artificial mother. A woman had a hen with seven chicks that were nearly two months old when the cold weather came on. By that time two had already died from leg weakness and two more were showing signs of it. Since then all have died. They were kept in a very warm cellar that was dry for a cellar, and the hen was given every attention, having food before her all the time. The warmth of her body could not be perfectly utilized by the large chicks as they increased in size, and it was only then that they succumbed to the cold. I believe the rapid growth from high feeding had much to do with the disease in my flock, rendering them "weedy" and soft in the bone for chicks of their size. If the precautions taken this Winter had been put in practice last Winter there is but little doubt that, owing to the mild weather, the experiment would have proved a success. As it is, the experience gained is valuable, and will point out the precautions to be taken this Summer to prepare for a Winter's campaign. The important question is going to be—can a heat of 70 degrees be maintained without a cost in excess of profitable management. With proper precaution and rooms admirably adapted to the purpose, I think it can be done, though I should hope for a less severe Winter than the one we are now passing through.

What I started to complain of was the false teachings of some contemporay periodicals on this subject. I find the last issue of the Poultry Bulletin saying: "Artificial heat is necessary in rearing very early birds, and this can be supplied better with a medium-sized coal stove, which keeps up a more regular heat than a wood fire, and it is less dangerous. As it is only necessary to keep up a low or slow fire, a half ton of coal should last eight or ten weeks, all that is really necessary being to keep the chill off the room, more than that being injurious rather than beneficial." This advice will lead the breeder into trouble. Men should sometimes practice things before they preach them.

TIME TO BEGIN WITH THE SITTERS.

IT is time now to mature plans for the coming year's campaign in the chicken yard. It matters not whether your purpose be to raise only common fowls for home use and market or whether you are of a more ambitious turn of mind and have some pet projects among the higher types of fowls, by the middle of January a selection of eggs for hatching should commence. If the eggs are kept in bran and placed in a room where the thermometer will not mark lower than 40 deg., they will keep several weeks and make a fair hatching. If they are to be purchased, then order them from breeders living as near to your home as possible, so that freezing weather may not catch them in transit. With reasonable precaution on the part of the shipper, weather for shipping can be selected that will reduce the chances of a severe freeze to the slimmest possibility.

After the eggs have arrived the next thing is to get a hen with a brooding fever on her. If your own flock is large, a week or two may be risked in waiting for one to show signs of brooding, and to detect this condition it is well to fill a nest with a half dozen artificial eggs. Eggs for this purpose I always preferred to get turned out of soft wood. They cost but little and never break and are not apt to crack real eggs when laid in the same nest with them as those made of hard substances often do. If a hen must be procured from a neighboring or distant farm, a little extra trouble will go a long way towards insuring success in getting her to stick to her work after she begins the incubation. By strictly pursuing the following plan, I have succeeded, in nine cases out of ten, in getting out of the strange hen the best work she was capable of performing. A box is made,

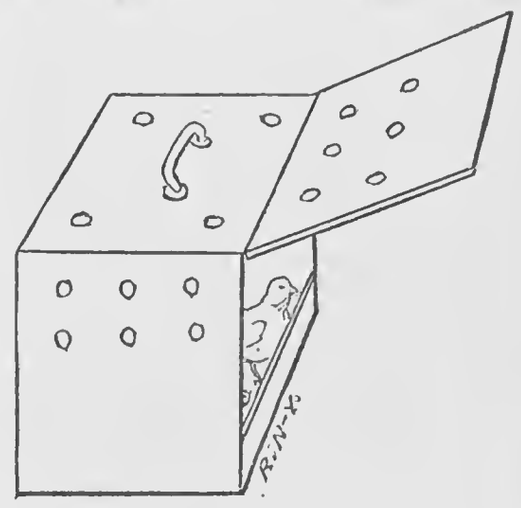

FIG. 39.

fig. 39, and a nest made in it of short cut straw. In this nest are put eight wooden eggs. Late in the afternoon when brooding hens are always on the nest, I get the wagon and start out with several of these boxes. After dickering with the farmer about the price of purchase or hire—for the hen can be returned when the chickens are taken from her—until the hen is mine I place the box as near as can be to her side, with as little noise and fuss as possible. Then place both hands under her, lift her gently but quickly on to the nest of wooden eggs in the box, and close down the lid. By the handle on the top of the box it is carried and placed in the wagon, and I move on to the next farm. At home an empty room is used as a place for the sitters. At this time of year a cellar is a good place, though with plenty of straw and a reasonably close room a good hatch may be looked for. In this room place the boxes as far apart as the size of the room and the number of boxes will admit, so that the hens may remember their own nests. Let them sit at least 12 hours in the boxes without raising the lids; then 24 hours longer on the wooden eggs with the lids up. By this time they will have become perfectly accustomed to the new order of things, and will settle down to regular business, so that it will be safe to put the setting of eggs under them.

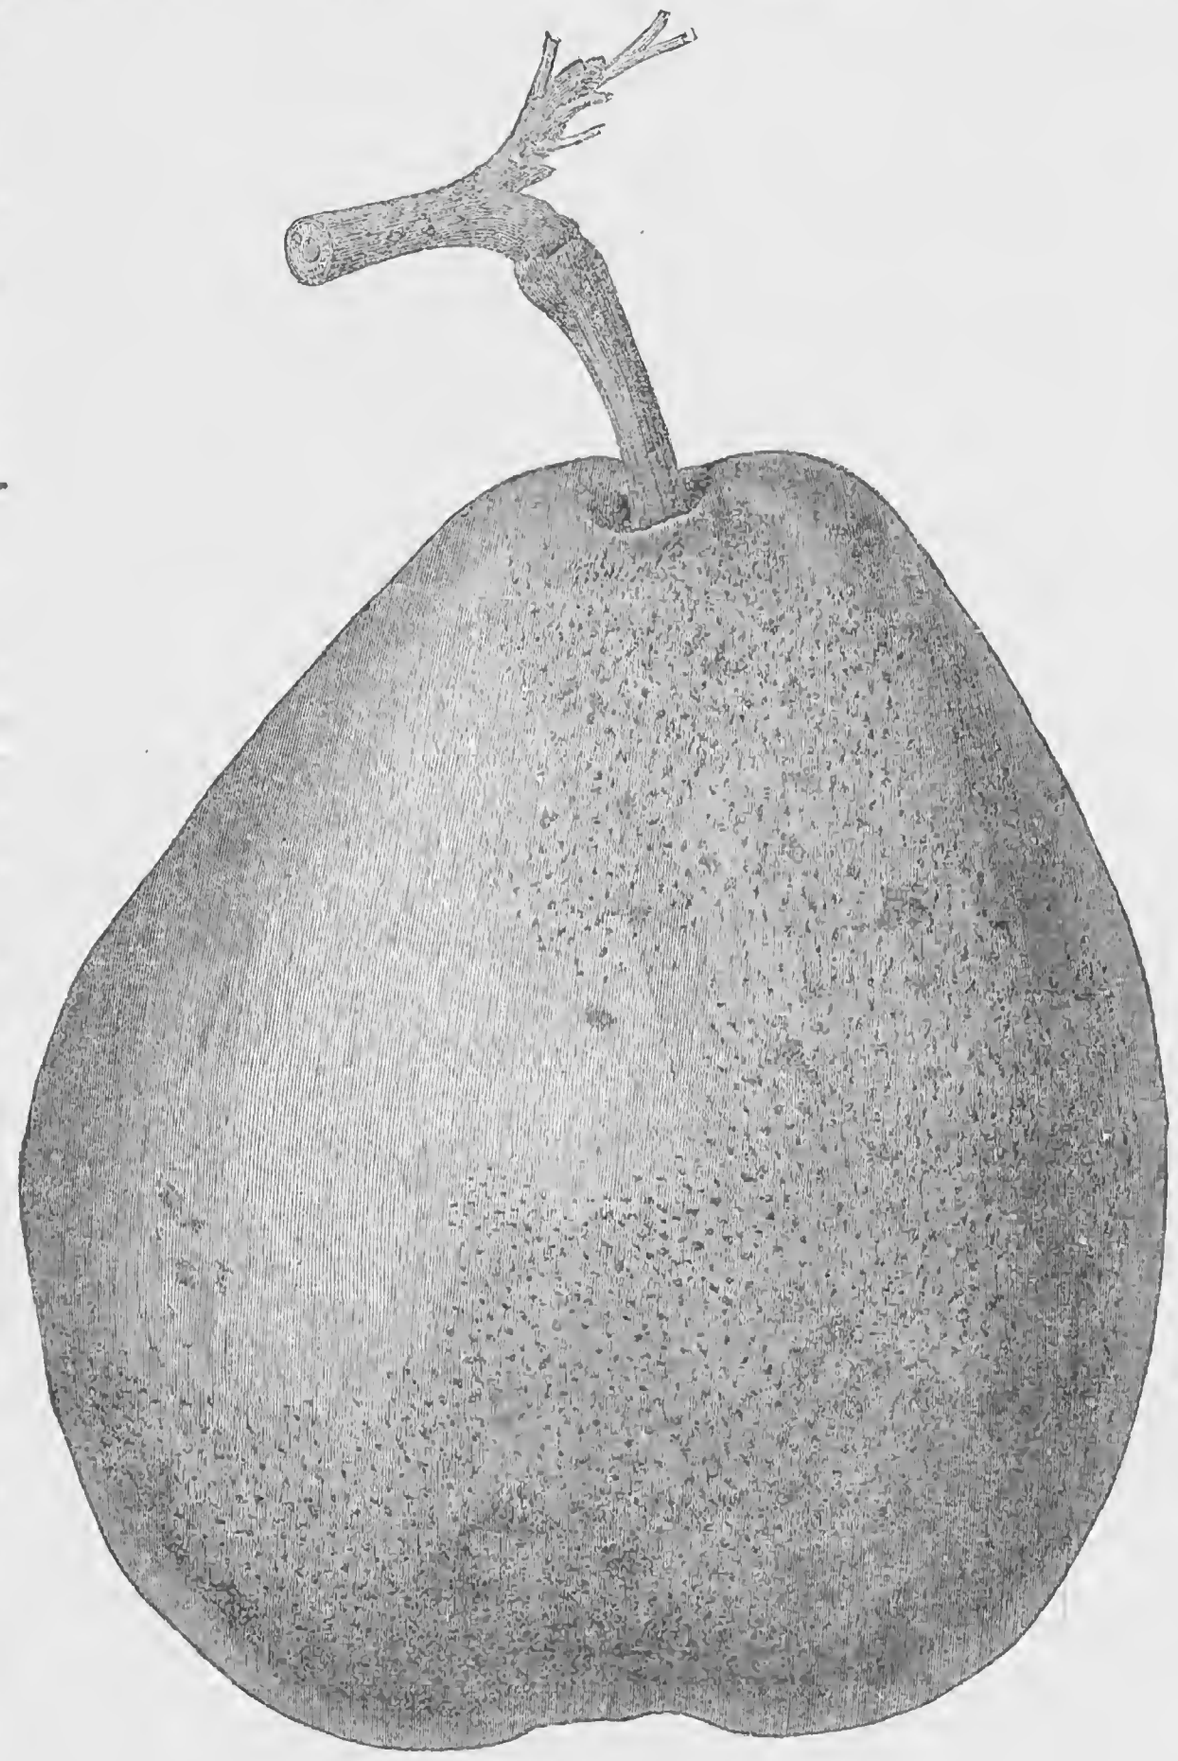
In the room should be placed an abundance of shelled corn. It is better than soft feed as it remains in the crop longer and thus keeps the hen satisfied. The dust bath in a box is a great thing, but is not so much needed at this season of the year as in warm weather. A dish of water must be at hand, and the floor should be sprinkled liberally with dry ashes. The nest and eggs should be examined every two or three days to see that no broken eggs are befouling others and to see that the hen does not scratch or work too much of the straw out of the nest. It is well to watch a hen for the first day or two, and if she leaves the nest too often or stays off too long, put her on and close the lid down, otherwise if she behaves herself the lid may be kept up all the time. The hinges being made of soft leather, allow the lid to be turned back and laid on top of the box. Holes must be bored in the sides and top for ventilation. The lid can be fastened by a button or cleets at the corners.

In handling sitting hens there must be no fear of their pecking, or trouble will be the result of it. The most vicious hen will be subdued by a fearless operator, while the peck is generally more alarming than dangerous. If

the hen sees you are afraid of her, she will keep up the fight. Quarrelsome hens should as far as possible be avoided, as they are generally the poorest sitters and injure their own and other hens' chicks when feeding together. Having tried nearly all breeds I much prefer the Brahma both as a reliable sitter and as a good mother, though she does tread on the little chicks if confined in a pen. She does not roam too much, however, or fight the chicks of other hens, and an abundant fluff makes her admirably adapted for raising chicks in very early Spring.

The number of eggs to the hatch should be regulated by the size and feather of the hen. In cold weather from eight to ten are enough for small and medium-sized hens and not over thirteen should be placed under the largest. This will insure more chicks than a larger number of eggs, as the hen moves them constantly from the center to the outside of the nest and, if the outer circle of eggs is not sufficiently heated, all will in time feel the effects of the cold and be injured. Then the size of the eggs should have something to do with regulating the number to the hen. Good judgment is of prime importance in arranging these matters. It has always been my practice in hot or cold weather to fill the corners of the box with dirt to prevent the eggs from working back into them. This also gives everything a tendency toward the center. It is also well, when the hens are strangers, to examine each carefully under the wings to see that she is free from vermin. This may be deferred until she has become somewhat accustomed to her new quarters so that she will bear handling without becoming panic-struck. The application of a mixture of lard and sulphur will generally cure this trouble when found to exist.

Hens with bad cases of scaly legs should not be used as sitters, for we are told by many authorities that the disease or affliction is certain to be conveyed to the chicks, and as it is caused by a small insect there is probably a large measure of truth in the statement. As a rule, aged hens are more reliable sitters and better mothers than pullets, though this is denied by some high authorities; but it can hardly be disputed that the older a hen is, the less likely is she to be timid and nervous, while her experience must count for something. To be sure a young Brahma is as tame as an old game hen, and I would prefer her for a sitting hen; but, as a rule, all other points being equal, I have found the old hens the best. In choosing the eggs for a hatching, get those as near the same age as possible, or they will not hatch out together, the fresher ones hatching perhaps two days before the old eggs, and the early chicks will coax the hen from her nest before all are out, thus causing a loss which might have been avoided if the proper precaution had been taken. Chicks raised or hatched in January or February make the earliest broilers, and the best show birds in the Fall; but May is early enough to get them out; for chicks hatched then lay just when eggs are dearest in the market.



THE NEW PEAR, DIRECTEUR ALPHAND.—FIG. 40.

The Naturalist.

SAP-SUCKERS AND WOODPECKERS.

JOHN W. ROBSON.

THE reading of the paper by your genial correspondent Gen. Noble, in the RURAL of December 25, afforded me much pleasure. It is so gratifying also to meet with one so versed in horticultural lore, so anxious and willing to learn the truth and so ready with all true humility to confess his ignorance concerning the subject he discusses, that I feel tempted to write a short *personelle* of the sap-sucker.

This species may be known by the bright red spot on the head; and in the male bird there is also a red spot on the throat—this spot is lacking in the female—a black spot in the center of the breast; belly, light yellow; tail black, the two central feathers white on their inner vanes, and spotted with black. The tongue of this genus is quite unlike that of any of the wood-pecker species, the tip, or horny portion, being rounded at the point, and highly developed, while the length of the tongue renders it incapable of being protruded much beyond the point of the beak.

The sap-sucker is migratory in its habits, usually arriving in Northern Illinois about the middle of April when it wages a vigorous war on the maple, birch, silver poplar, apple, and cherry. It attacks the most thriftily growing trees, preferring in the orchard the following varieties of apples:—Yellow Belleflower, Red Astrachan, Rambo, Talman Sweet, and other varieties of the same class. The wounds made by the sap-sucker penetrate to the hard wood, and a portion of the inner bark and cambium layer is eaten out. These holes are from one-eighth to a quarter of an inch in diameter, and are generally close together, in regular lines, running around the tree, girdling the trunk and larger branches with one or more rows. The sap-sucker is a very silent bird, seldom uttering a note when feeding. An occasional "kewee" "kewee," when flying from tree to tree, is its only utterance. I never lost a tree, or had one injured to any extent by these birds during my twenty years' ownership of a large orchard in Illinois; and I still think a long row of Yellow Belleflowers were rendered more fruitful by their yearly perforations. I never joined in the perpetual crusade against them carried on by my brother horticulturists. I never gave them a bad name, or pursued them with the shot gun, and the large number of well filled barrels standing beneath the trees in the Fall of the year, bore ample testimony that the protection afforded them was abundantly rewarded.

The Hairy Woodpecker (Picus villosus), is no doubt the bird to which the General refers as the "fellow that makes the splinters fly." It is about the size of the sap-sucker, and is too often mistaken and destroyed for that bird. The head is black, with a broad, red band; breast white; wings, black spotted and tipped with white; outer tail feathers, white. The tongue will protrude two inches or more beyond the point of the beak, and is provided with a narrow, sharp, horny point, plentifully supplied with recurved barbs, a most perfect instrument for abstracting borers from their burrows. Cheerful and industrious, he is always on the lookout for the larvæ of the order Buprestidæ, that burrow in the substance of the wood, or under the bark of trees. As he explores suspicious localities with gentle taps of his beak, he quickly detects the evidence of unsoundness, and is not slow to learn the cause. Borers are his hobby; soon he chips an opening, and with his long slender tongue, armed with its lance-like barbed point, he soon extracts the enemy. While engaged in his beneficial work, he now and again utters his cheerful "Pliek" "Plick," in a sharp key, as if conscious that he is engaged in a good cause, and is not ashamed to own it. You can always tell where he is at work. He asks no pay for the valuable work he performs. Horticulturists—protect him, for he is your friend. May that gun ever hold fire that is directed against the Hairy Woodpecker.

The Downy Woodpecker (Picus pubescens,) is the smallest of the species. In color, markings and voice he is precisely like his hairy brother, differing only in size, being a mere pocket edition of the Picus villosus. He is an industrious little fellow, destroying the pupæ of moths injurious to trees, busy during the long Winter months searching for and destroying the borers which infest the raspberry and the currant. Doubtless this is the *wee chap* Gen. Noble saw "flitting through the currant bushes." He is another of our friends—spare him.

There is another useful bird which is often mistaken by orchardists for the sap-sucker. By some he is erroneously called by that name; but his true name is the white-breasted Nuthatch—Sitta Carolinensis. He may be readily known from his habit of running around the trunks of trees, with his head down. He feeds on insects lurking beneath the scales of bark, also on the seeds of the elm, maple, and beech. He is especially fond of pumpkin seeds. A few of these stuck on the trees or at the root will induce these industrious workers to remain in the orchard.

During a long life spent in the culture of fruits, I have never killed a bird, as I have always esteemed them as friends. Busy workers they are during the Summer and Fall months; and even in the gloomiest season when the sleep of nature so closely resembles death, we have birds which are actively engaged prying into the private affairs of the insect world, often laying waste the prospects of a promising family by one stroke of the bill, and hunting up and destroying insect life so diligently as to entitle them to the honor of being the friends and co-laborers of man.

Dickinson Co., Kan.

Pomological.

THE NEW PEAR, DIRECTEUR ALPHAND.

IT seems by the London Garden, from which we have had our illustration re-engraved, that the Messrs. Croux, of Sceaux, near Paris, are the introducers of this showy pear. It is spoken of as being always large, measuring between six and seven inches in length and sometimes more, by three to four inches in diameter. Its skin, which is yellowish-green, changes to a gold color, spotted with red and sometimes possessing a rosy tint on the side next the sun. The eye is small; flesh white, firm, close and slightly gritty towards the center—very sweet and delicate in flavor. It is further described as being "altogether one of the best pears of its season which is from February to April." As this pear is now offered for sale, we presume it will be tested at once in this country.

Entomological.

THE ARMY-WORM.

PROFESSOR CYRUS THOMAS.

THE public is indebted to Professors Riley and Comstock for recent able and important articles on that erratic but occasionally very troublesome pest, the Army-worm—that of the former in the July, August and September numbers (1880) of the American Entomologist; that of the latter in his last report as Entomologist of the Agricultural Department. While the importance of these articles is cheerfully conceded, they contain some statements and present some views which I cannot let pass without a mild protest.

Number of Annual Generations.

The first of these statements to which I call attention is a statement found in both. In the article by Professor Riley it is as follows: "From the time Fitch wrote so fully on the species in 1861, until the record of our observations in 1875 and 1876, it was the prevailing belief among entomologists that there was but one annual brood of the species, no absolute evidence of a second brood having been obtained." In Professor Comstock's it is in these words: "The number of generations in a season varies greatly with the climate. It has always been supposed that there is but one in the Northern States, but there will probably be two on Long Island this year," etc.

Although Dr. Fitch does not discuss this point in his article on the species (Sixth Report 1861), it is apparent to every one that he proceeds upon the assumption that it is double-brooded. He speaks of the growth and perfection of the Summer brood. Further on, in giving his theory of the cause of their multiplication, he uses this language: "The Spring and early Summer of this year were exactly the reverse of last year, unusually wet, and the water high in all our streams. Hereby the swamps have all been over-flowed, and this insect has been drowned out of them. The moths or millers coming out of their chrysalides, found it impossible for them to get at the roots of the grass there to deposit their eggs." With these statements before us, I think we must conclude that he believed the species to be double-brooded.

Dr. Packard's language in his Report to the Maine "Board of Agriculture," 1861, also appears to indicate a belief at that time that it is double-brooded even in the Eastern States, though his subsequent writings express an opposite opinion. His language in reference to Illinois shows clearly that he believed it to be double-brooded there: "In Illinois the moth lays her eggs in April and May, from four to six weeks earlier than in the Eastern States; so the larva appears earlier; the moths lay their eggs for a second brood in June and July."

In the Prairie Farmer of June 20, 1861, I expressed my belief that it is two-brooded; and this, in fact, was one of the chief points of the long controversy between Mr. Walsh and myself, as Professor Riley properly states in his second and eighth reports. In the same paper, August 22, 1861, I cited one instance in this county where the second brood of worms was observed in such numbers that they cut out all the grass in a corn-field and even attacked the hard leaves of the ripening corn. In 1874 I also noticed at Carbondale, Ill., in September, an army of these worms marching across the road to a field of young rye which had been sown very early.

Professor Riley's saving clause "prevailing belief" may be intended to cover the exceptions, and Professor Comstock's application of the term "Northern" may exclude Illinois; but the expressions are rather too sweeping to be allowed to remain unnoticed, as they are calculated to lead astray those not acquainted with the literature of this subject.

Proper Home of the Species and Character of the Seasons favorable to its Development.

In Professor Riley's article of 1880 above referred to (Am. Ent. Sept.), we find the following statement. After mentioning certain facts, he remarks: "These facts clearly disprove Fitch's theory, and we must believe that the Army-worm is most likely to appear after dry seasons, regardless of the wetness or dryness of the season in which it occurs." He then proceeds to criticise somewhat severely Dr. Fitch's theory, and concludes that he was "hard pressed for argument" to support his theory.

If we turn to Professor Riley's Second Report (1870), we find him expressing his opinion very decidedly, as follows: "The Army-worm delights in fact in cool, moist and shady situations, and from the passages already quoted from Mr. Kirkpatrick, where it is shown that the worms which swarmed on the Cuyahoga

flats, did not attempt to remove to land a foot or so higher; and from further facts recorded by Dr. Fitch, it becomes evident that its natural abode is in the wild grass of our swamps, or on low lands. During an excessively dry Summer, these swampy places dry out, and the insect, having a wider range where the conditions for its successful development are favorable, becomes greatly multiplied. The eggs are consequently deposited over a greater area of territory, and if the succeeding year prove wet and favorable to the growth of the worms, we shall have the abnormal condition of their appearing on our higher and drier lands, and of their marching from one field to another * * * * * * Thus the fact at once becomes significant and explicable that almost all great Army-worm years have been unusually wet, with the preceding year unusually dry, as Dr. Fitch has proved by record. The appearance of the insect last Summer of 1868 was unusually dry and hot, while that of 1869 was decidedly wet."

In his eighth report (1876) he reaffirms the same view with emphasis. "It is a well established fact that all great Army-worm years have been unusually wet, preceded by one or more exceptionally dry years; and the widespread appearance of the insect in 1875 formed no exception to the rule. The explanation of this fact originally given by Fitch is beyond doubt correct in the main, but needs further elucidation."

Here, then, we have his assertions based upon his own investigations during two Army-worm years, that "it is a well established fact that all great Army-worm years have been unusually wet." In 1880, all this evidence, so positively affirmed, is thrown aside, Dr. Fitch's theory, formerly pronounced correct in the main "beyond doubt," is also pronounced erroneous. He even adds that "the view that the Army-worm has its proper home in the wild grasses in the swamps, as Dr. Fitch has assumed, must also be considered erroneous—an opinion which he also affirmed in his former writings.

When we find by new evidence that an opinion formerly given is incorrect, candor requires that we should abandon it and acknowledge our error, and Professor Riley is generally free to confess the changes in his own views, though in this particular point not so fully as justice to Dr. Fitch required. But the point I desire to urge in bringing forth these facts is this: as Professor Riley expressed his opinions so positively heretofore, based on a much larger amount of evidence than he has for his present view, and as his changes in reference to many of the most important characters and habits of the species have been so repeated and radical, can we feel satisfied with his present views in reference thereto? And more especially are we disposed to hesitate when we find his new views based upon such slender evidence, and differing in some most important respects from those expressed by Professor Comstock.

As to the last point, I am inclined to hold, as I always have done, the same view that he expressed in 1870, because the facts sustain it. The year 1855 was wet in Ohio, as the testimony of Mr. Kirkpatrick shows: Schott's Rain Tables not only confirm it, but show that this was a wet year in all the Northwest. That the Spring of 1861 was not only wet, but cool, in Illinois and the Northwest is seen by reference to the "Record of the Season" in the Prairie Farmer of April and May, 1861. The following records of annual rainfall in the East also correspond with what is well known to have been the fact in the West:—

	Inches.	Inches.
Burlington Vt., average	34.15	1861—42.56
Boston, Mass., "	44.99	1861—50.07
Providence, R. I., "	41-54	1861—44.25
Penn Yan, N. Y., "	28 42	1861—32.74
Marietta, Ohio, "	42.70	1861—46.41

In the West the chief rainfall of this year was in the Spring, many of the stations, taking the whole year, not rising above the average. To the fact that the Springs of 1869 and of 1875 were wet Professor Riley bears testimony in the extracts already quoted. In the year 1817, so far as the few records made show, the annual rainfall in the New England States was slightly below the average, while in Eastern Pennsylvania and Maryland it was slightly above. But it is a somewhat singular confirmation of Dr. Fitch's theory that at New Bedford, the only monthly record we have, the rainfall in June, 1817, was more than double average. (Blodgett's Climatology, '58 and '81.) The year 1816 was dry, but was unusually cold, being equaled (during the first half of the century) only by 1812. The facts, therefore, so far as they can be ascertained, are largely in favor of Dr. Fitch's theory.

Before the questions as to the number of broods at different latitudes and the method of hibernating can be definitely settled, it will be necessary to ascertain the average length of life of the individuals from the time the eggs are deposited until the resulting moths deposit their eggs; also, whether they appear in definite broods. I have collected facts bearing on these points, but will defer their discussion to a future paper.

Miscellaneous

CATALOGUES, ETC., RECEIVED.

LARGE SALE OF JERSEY CATTLE.—Catalogue of 45 head of imported Jersey Cattle for sale at public auction at Degraaw Farm, at Jamaica, Long Island, on Wednesday, February, 9th. These cattle were imported from the island of Jersey last October and are all entitled to register in the American Jersey Cattle Club.

QUARTERLY REPORT of the Kansas State Board of Agriculture for the quarter ending December 31, 1880

MISAPPREHENSIONS CORRECTED.

A FRIEND from Preble County, Ohio, writes us: "Those subscribers whose names I sent in were surprised when they received their potatoes—they look so much like a small Early Rose. The picture in the Fair Number of the RURAL looked so large and fine, and those tubers we received so small!"

[We beg to say that in our "Plant and Seed Distribution" announcement it was stated that a White Elephant Potato of *medium* size would be sent to applicants. It will appear that the postage on each is five cents, not to speak of the cost of box and packing. Now we charge our subscribers but six cents on the *entire* distribution. Were we to send a larger specimen, we should have charged our subscribers more postage. No matter what the size, we guarantee them to be true White Elephants.—EDS.]

"I do not know whether you have the history of the Blount Corn; but about the year 1858 there was great excitement in the agricultural papers about Peabody's Branching Corn. I have seen as many as eight small ears on a stalk of it. A good many paid very high prices for seed, but soon abandoned it. It was too late for this climate and was too tedious to husk. Is the Blount Corn the Peabody Corn on its periodical rounds?—[Oh, no.—EDS]. I think from the picture of your Chester County Corn that it would be too late a corn for this country. We try to get a large ear with a small cob necessarily, and a long, slim grain—more of a gourd-seed or shoe-peg style.

[We do not pretend to know whether the "Chester" is worth growing in your climate or not. We do not recommend it to anybody or for any section of country. It is so with Blount's. We would not advise our next-door neighbor to grow it. We have merely told what it has done at the Rural Farm and our methods of treating it. We have no interest in either variety beyond that which attaches to our tests. Our earnest advice to our friends is, touch all untried things cautiously.—EDS.]

KIND WORDS FROM RURAL FRIENDS.

I COULD not farm without your valuable advice. N. B. BOOTH.
Pittsburg, Ind.

WITHOUT any idea of flattery I can truly say the RURAL NEW-YORKER is improved in an extraordinary degree, for it is interesting to everybody, old and young, rich or poor, and it is at the same time instructive and amusing. It is such a cheap publication, too! Just consider how superior it is to some monthly papers, each number having more valuable information every week than the others have every month, and yet, not reckoning the seeds distributed, etc., it costs less to have 52 lively papers than 12 dry, laboriously common-place ones full of old and uninteresting advertisements.
GEORGE GARDNER.

I THINK the RURAL heads the list as an agricultural journal. The contents are well selected and reliable, and are well printed on good paper. Then, too, it always arrives on time.
Ft. Atkinson, Wis. D. B. MORRISON.

THE RURAL is either growing more valuable from week to week or else I am becoming more interested through better acquaintance.
C. E. THORNE.
Farm Manager, Ohio State University.

THE RURAL NEW-YORKER is the best agricultural journal in existence.—Vindicator, Cameron, Mo.

THE RURAL NEW-YORKER is certainly one of the best agricultural papers published, and a general circulation of it in this county would do much towards developing the agricultural resources of the county.—Messenger, New Martinsville, W. Va.

THE RURAL NEW-YORKER is one of the foremost agricultural weekly journals of the age. It is worth its weight in solid gold.—Planter and Farmer, Richmond, Va.

BEING a farmer, I feel most interested in—the whole paper. My wife says she cannot do without it, and the children cry for it.
Covert, N. Y. A. H. COLE.

THE RURAL has come to be a necessity to us. Its suggestions, positive instructions, experiments, advertisements, and everything about it are a constant help, and invest agricultural pursuits with fresh interest E. P. ARTHORP.

THE lady of the house, Mrs. Wallis, says the RURAL is the best paper of the bunch we receive, and I have never disputed it.
WILL N. WALLIS.
Prop'r Exp. Farm, Collin Co., Texas.

THE RURAL is the best of papers.
Cortland Co., N. Y. J. G. BINGHAM.

I CONSIDER the seeds, etc., you have sent me worth several times the subscription money I have sent you; and then there is the paper itself! 'Tis a store of useful information which far surpasses all the "farm books" I have ever seen. Can't you give an index to each number? I suspect this is asking a great deal. I save every number, and when I want to refer to a recipe or article I am obliged to look over many numbers sometimes, page by page, till I find it—frequently overlooking it, especially if the article is a short one. I can't tell you which department of the paper I like best. Each member of the family is eager to read it when it comes. W. MANNING LEMEN.
Shepherdstown, W. Va.

I RECEIVED the sewing machine works three days later, all right; am very much pleased with the machine. Many thanks. I feel well paid for all my trouble.
Suffolk Co., N. Y. L. BEECHER HALLOCK.

THE reasons I give for taking the RURAL NEW-YORKER another year are, first, its perfect truthfulness and reliability—when a promise is made I know it is as sure as a note—also its instructive and moral reading.
Clinton, N. Y. B. ELPHICK.

I HAVE been taking the RURAL for 16 or 17 years. It is without a doubt the best paper of its class in existence. I can see but little room for improvement, if any. C. W HAMILTON.

WE cannot do without the RURAL. We have taken it for at least 12 years.
Bergen, N. J. J. H. SPOFFORD.

THE RURAL suits me exactly, or at least the nearest of any agricultural, horticultural, floricultural, or any other 'cultural paper that I have seen, and I have quite a wide range of reading in these lines. Your original engravings are very good, and the articles from the leading writers in the country are what make it my favorite. FRANK MCMAHON.
Red Bank, N. Y.

IT does one good to see the variety of experience in fruit growing from all parts of the country as described in the RURAL. We look for its opinion, and *trust* to it, particularly in its full and varied information regarding our own specialties—apples and grapes, and the cultivation of flowers. ANNIE L. JACK.
Prov. Quebec, Canada.

THE RURAL is one of the best agricultural and household journals in the world, and it gives away to every subscriber each year, free, more than the worth of the subscription price in valuable farm and garden seeds.—Observer, Pembroke, Ont.

I HAVE been reading the RURAL NEW-YORKER nearly a year, and I like it much better than any similar publication I ever read.
Norton, Kansas. D. E. STEVENS.

I HAVE been a reader of the RURAL for about 20 years, and do not intend to do without it as long as I can raise the money. I have sent in a club this year. N. L. CARTER.
Marshall Co., Iowa.

THE RURAL NEW-YORKER is one of the best agricultural papers published, and should find a home in every farm-house in the country. Its managers work 82 acres of land as experiment grounds, not only giving through their journal the result of these experiments, but also distributing free to their subscribers many valuable and rare seeds.—Journal, Wyoming, Iowa.

IT is now generally conceded that the RURAL NEW-YORKER is the leading agricultural and horticultural authority of this country. Its experimental grounds of 82 acres, which are worked in the interests of subscribers; its free distributions of new and valuable plants and seeds, have greatly added to its popularity, while its pages, filled with original contributions from the best writers in the world, profusely illustrated with drawings from nature, render the paper invaluable to every farmer, gardener or fruit grower in the land.—Patriot, New Lisbon, Ohio.

I AM highly pleased with the very valuable knowledge for the farmer and gardener gained from the Rural Farm and Experiment Grounds. It is almost invaluable. I would suggest that each plant be thoroughly tested, and that you should then state whether it is hardy or not in the latitude of New York. This I consider a point of much value to beginners in farming and gardening, also to the more experienced. Our plant and seedsmen fail to do this, and consequently thousands of persons yearly lose their money and time by buying seeds and plants that will not stand their climate.
Glens Falls, N. Y. E. W. KNIGHT.

What Others Say

CANNED MEAT.—A writer in the Maine Farmer frightens us in the following manner: "There have been men all through this country buying what they call 'canners,' which consist of old sheep, no matter how much diseased; anything that could stand alone, such as were so poor that the farmers could not Winter them; also old diseased cows and old bulls with wolves on their jaws—anything does to can. I was at the village the other day and saw a large amount of these old sheep's carcasses that were being shipped to Portland, and they did not look fit for dogs to eat; and in fact, I think it dangerous for any one to eat such meat."

WHAT POWER FOR CHURNING?—During a recent meeting of the Elmira Farmers' Club, as reported in the Husbandman, the question, "What is the best power for propelling a churn?" was discussed:

J. BRIDGMAN—The cheapest animal power is a calf, I think, where the dairy is no more than six or eight cows. There is a dairyman in my acquaintance who milks from a dozen to 16 cows and churns with a yearling calf to which he feeds the buttermilk liberally, but in other respects the animal fares the same as the yearlings at pasture. The one that does the churning always outstrips the others in growth.

CHARLES HELLER—The churning for a dairy of 13 cows on my farm, last Summer, was done by a sheep. But there is an objection to the use of sheep and calves for churning in the bad odor they impart to the room.

G. W. HOFFMAN—Do you use a wheel power, or the endless chain principle?

CHARLES HELLER—The endless chain tread power. All things considered it is better than the wheel—more convenient and easier for the animal.

J. BRIDGMAN—When a calf or a sheep is used, the wheel or machine should be placed where the odor of the animal will not enter the churn room. There is one rule that I would lay down as imperative—that some force besides man power should be used for churning. If I had but two cows I would employ something besides human muscle to do the churning. A farmer can make a calf do the work without trouble, and the power will then make no cost beyond the machinery for using it. That is a better way than any other in most dairies where not many cows are kept, but with large dairies a larger animal must be employed.

PYRETHRUM.—From an interesting and important paper read by Professor Cook before a Michigan Horticultural Society, is taken the following parts which should be found instructive to all persons:—This substance has long been in the market under the name of Persian and Dalmatian Insect Powder and sold as a destroyer of house flies, roaches, etc. But, owing doubtless to the fact that the effective element is a volatile oil, the foreign substance often failed to destroy, as it did in my hands. The essential element had escaped.

In 1879 Mr. Wm. Saunders, of Ontario, experimented with the Persian Insect Powder, the pulverized flowers of Pyrethrum carneum and P. roseum, and the Dalmatian, the powdered flowers of P. cinerariæfolium. He found the latter the most efficient. It only kills by coming in contact and seems to paralyze the insect at first and finally kills it outright. Mr. Saunders experimented with house flies, blue-bottle flies, grasshoppers, plant lice, etc. He found that all fell upon their backs in from two to six or eight minutes. The insects remain paralyzed sometimes for two or three days before they die, and a few were seen to recover so far as to walk or fly away.

Professor C. V. Riley has also attacked this problem. His experiments show that this substance is equally effective against nearly, if not quite, all our insect foes. He has found that mixing the pyrethrum with flour in the proportion of one part of the pyrethrum to twenty parts of flour, in no way injures the value of the application, and that when mixed with water at the rate of one tablespoonful to one or even two gallons of water, it still is potent to destroy.

The great argument in favor of pyrethrum is its harmless nature as affecting man and other animals of the mammalian branch. When breathed it is no more disagreeable than any vegetable dust.

Heretofore the cost of pyrethrum has been a bar to its general use. It has been sold at

$1.25 per pound; but Mr. Mileo, of Stockton, California, who has for the last few years grown this plant very successfully, has informed Professor Riley that he has grown 147 pounds to the acre, and that the whole expense of putting it on the market need not exceed six or seven cents. When its culture becomes common, then we may expect that the price will not exceed that of London-Purple. Mr. Milco grows the P. cinerariæfolium, and so manufactures the Dalmatian powder under the name of "Buhach." It is probably true that this plant can be grown in the Southern States, and very probably in all sections of the United States; if so, we may expect very soon to find it in the market at rates within the reach of all.

During the past season I have tried this pyrethrum, "Buhach," which I received through the kindness of Professor Riley, on the larvæ and imagos of the potato beetle, on the cabbage caterpillar (Pieris rapæ) on squash bugs, on plant lice, on house flies, and on mosquitoes, and found it speedy death to all except the squash bugs, which even lived in the powder for three days before dying. I also found that one tablespoonful of the powder to forty of flour was effective in killing the cabbage caterpillars, and that the same amount of powder to two gallons of water was even better, owing doubtless to its more thorough application. The result seems to depend more on actual contact than upon the amount of powder.

The significance of these facts is fairly startling. We have a cheap, non-poisonous insecticide, by use of which noxious caterpillars are brought low, beetles and their grubs exterminated, flies and their maggots put *hors de combat*, plant lice overcome, parasitic lice—of course I mean those affecting sheep, cattle, fowls, and other of our domestic animals—exterminated house flies and mosquitoes sent where mankind has long wished them.

To apply this substance to insects which destroy vegetation, we can best mix with water and apply with a fountain pump. To kill house flies we have only to throw the dust about the room by use of a bellows. To destroy vermin on our domestic animals we can wash them with the liquid mixture, or dust it well through their hair, wool and feathers, and in case of close rooms like poultry houses, fill the room with the dust.

THE MILLSTONE of October has the following:—"A most commendable enterprise of the RURAL NEW-YORKER is its experimental farm. Upon this farm scientific tests are made with the numerous plants about which farmers dispute, and development is given to discoveries that are results of the experiments. An unimpeachable authority for the editorial opinions of the paper is thus practically set forth, making it a thoroughly reliable, interesting and invaluable publication. An illustrated article showing a comparison of the wheats most in favor among farmers, is about as interesting reading as we could select, and coming from the source it does, we have no doubt will receive the earnest attention of every reader."

Everywhere.

FACTS ABOUT IOWA.

HERE are a few facts concerning Iowa, gathered during a trip through different sections of the State. The surface of Iowa is generally undulating, and in some places almost hilly; yet I think it has less of waste land in proportion to tillable land than any other State in the Union. The soil in the eastern part of the State is a rich black loam, intermixed in some localities with sand, and in other places, with gravel and clay; while that of Western Iowa is known as the "bluff deposit," peculiar to the Missouri slope. I wish to draw special attention to the superior advantages Iowa enjoys for the successful breeding of all kinds of stock, for, while the plains abound in rich, nutritious grasses, affording excellent pasturage during the Summer, these grasses may be cut and cured for hay at a small cost. Then again, as this State ranks second in the production of corn, it will be seen that plenty of feed can be had for Winter use. Another essential to the keeping of stock is water, which can be had in great abundance here; for if there is no stream running through or adjoining one's farm, water may be had by boring wells varying in depth from ten to forty feet, according to locality. The State now ranks first in the raising of hogs, and fifth in the number of milch cows, while the raising of sheep is fast assuming vast proportions; and we confidently believe that Iowa in the near future, is destined to become the first State in the Union in the production of both wool and mutton.

Among the counterbalancing disadvantages of the State may be mentioned the high rates of interest; taxation of live stock, which, however, is light, as the valuation is put at a low figure; the chinch bug, which is not as destructive as is generally believed, a large acreage of wheat having been harvested the past season; and occasionally in the Fall a heavy wind and snow storm called in the West a "blizzard." But there are disadvantages to be met with everywhere, and here the chances are greatly in favor of men of energy, who wish to invest their all in a home, becoming independent in a few years. There are yet thousands of acres of first-class land in Western Iowa for sale on reasonable terms. Land of this sort is fast being taken up, however, as the immigration to the State is immense, and is composed mostly of the better class of citizens of the United States and Great Britain. M. L. F.

RURAL SPECIAL REPORTS.

ARK., Poteau, Scott Co., Jan. 1.—We have had some very cold weather the past two weeks for this country. On the morning of the 29th ult. the thermometer was below zero. There has been but little snow since November. Crops of nearly all kinds were good the past season, except wheat. It was very poor. Corn averaged from 25 to 50 bushels per acre; cotton on good land yielded a bale per acre. Prices are about as follows: cotton, 10 to 10½c.; corn, 50c.; wheat, none selling; pork, 3 to 5c.; oats 50c.; eggs, 15c.; butter, 20c.; honey, 12½ to 16⅔c. N. C. B.

ILLS., Champaign, Champaign Co., Jan. 8,—With the exception of five or six days, the earth in this part of the country has been covered with a light, dry snow since early in November. This means that the Winter has been dry and cool—but not very cold, except the last week in December, when a northern blizzard, or a "Manitoba cold wave," came down upon us with great force and sent the mercury down to 24 degrees below zero. Since, it has snowed a little every other day or so, and the temperature has been only seasonably winterish. In its generally moderate temperature, its many but light snows, its freedom from thaws and rainfalls, this Winter very closely resembles that of two years ago, after which we harvested the phenomenal Winter wheat crop of 1879. The feeding season has been a very favorable one for stock of all kinds, except on the occasions named, when cattle and hogs suffered very much and shrunk severely. It is not the degree of cold that stock suffer from so much as the force of the wind, 10 degrees above zero, with a gale of wind, being far worse to bear than 30 degrees below, in a still atmosphere. Fancy then, how stock must have suffered on the 29th of December, exposed to a strong wind and the mercury ranging from 24 deg. at sunrise, to 10 deg. or 15 deg. below zero in the evening. This blizzard made itself felt over the entire country, killing the orange trees to a certain extent in Florida, and making skating in southwestern Texas, where such a thing was never known before since "Americans" have lived there,—that country having been only lately settled in 1835, when there was a sudden storm similar to the one under notice. The peach trees and all the blackberries but the Snyder, are reported mostly destroyed as far south as 38 deg., and the tender raspberries and half-hardy grapes have gone in the same way. In this latitude, I have never known the apple and the pear crops seriously injured by the frost, and what we lack in one direction, may be made up in another. But the Winter wheat crop, which is now next to corn the great crop of the country, having gone into winter-quarters in an excellent state of preservation and having ample snow protection, at this time promises a crop equal to that of 1879, with the added advantage that its acreage has been nearly doubled. B. F. J.

KAN., Clay Center, Clay Co., Jan. 6.—The holiday week was extremely cold here—19° below zero on December 29. An inch and a half of snow on our smooth roads made tolerably good sleighing, which was made use of by every one who could find anything in shape of a sleigh or a pair of runners on which to mount a dry goods box. A. E. S.

N. C., Henderson, Granville Co., Jan. 5.—On examining my large orchard of peaches this morning I find an almost entire destruction of the fruit buds of all kinds of budded varieties, while the seedlings and common peaches of the county are not yet hurt. The thermometer on the 30th and 31st of December sank here to about 3° below zero, and in some places to 10° below. This is a greater degree of cold than ever known here before in the memory of man. This is the third consecutive year in which we have had no peaches for market, but a Winter destruction of the buds was never before known. It has always been due to the late Spring frosts. H. S.

OHIO, Toledo, Lucas Co., Jan. 11.—Thermometer this morning 6° below. W. H. K.

PA., Northumberland, Northumberland Co., Jan. 10.—This county is noted for its agricultural and mineral wealth. The Shamokin coal is known wherever coal is used, whilst another part abounds in iron ore and limestone, and the northern part of the county is a finely improved farming country, devoted principally to a mixed husbandry, so that we never have a total failure of crops. The hay crop was very light last year, as was the oat crop, while wheat and corn were heavy. Most of the corn has changed hands at 50 cents per bushel. It is now but 45 cents. The Winter has thus far been very severe, and as the cold weather set in early it found a good many farmers unprepared for the change, and hundreds of bushels of potatoes and apples were frozen. Farmers that have suitable land are turning their attention to raising tobacco, of which about 1,000 cases were raised this last year. Most of it is on the poles, on account of the cold weather, which prevents it from being taken down. R. C. M'W.

PA., Lineville Station, Crawford Co., Jan. 10.—We are having nice Winter weather. There has been good sleighing since some time in November. There was fully as much wheat sown this Fall as in previous years, if not more. Owing to the dry weather corn was not more than an average crop; potatoes were rather below the average. Feed promises to be scarce before Winter is over. Hay is selling at $10 per ton. Wheat is worth $1 per bushel; corn, 30 cents per bushel in the ear; oats, 35 cents. R. H. S.

PA., Derry Church, Dauphin Co., Jan. 8—The weather has been extremely cold. On December 30 the thermometer stood 8 deg. below zero, and on January 1, 12 deg. below. The fields, however, are covered with snow to the depth of about nine inches, so that the grain does not suffer. Wheat sells at $1 05; oats, 40c.; corn, 50c., and rye at 80c. per bushel. Hay is worth $25 per ton; butter, 25c. per pound; eggs, 25c. per dozen. E. E. B S.

WIS., Chilton, Calumet Co., Jan. 8—The weather has been intensely cold here; the thermometer has been at zero, and below most of the time for the past two weeks, the lowest point being 25° below zero. This morning it is 15° below. We have had no snow to speak of—three or four inches in all. C. C. C.

The Querist.

ANSWERS TO CORRESPONDENTS.

Splinter in a Horse's Foot.

W. H., E. New Market, Ind., says a four-year-old mare of his kicked a board down in the stable, and after a few days he noticed that her leg was somewhat swollen in the mornings, but the swelling would go down after she had been used a little. She did not appear to be lame in the least. After some time he found that a large splinter penetrated right through the frog into the fleshy part just above. After it had been removed, he poulticed the place with flax-seed and worm-wood, as there was considerable fever in the leg from the foot to the gambrel joint. He washed the place with castile soap and water and then used weak carbolic acid water and blue vitriol, but the inflammation continued. He then bandaged the leg at night, using warm vinegar and sometimes warm alcohol, and the trouble seemed to settle in the gambrel joint, which becomes swollen on the inside when the animal is not used. Our friend has used several remedies, but, not having effected a cure, he asks what treatment should be employed.

ANS.—Our correspondent could not have done better than, directly after withdrawing the splinter from the frog of the foot, to poultice with warm flax-seed. He should have kept this on, if the wound suppurated, till it ceased running, then applied sweet oil or mutton tallow, and bound up with linen cloth till healed. The fever and swelling of the leg which followed were in consequence of the pain and irritation of the wound. This swelling would probably have ceased soon by merely bathing the parts swollen with water as hot as the hand could bear, and then wrapping it up warm with bands of white cloth or uncolored woolen cloth of any kind. Colored cloth should not be used, as its dye might prove injurious to the leg. This treatment may be used now. Then bed the mare well, so that she can stand on something soft, and keep her in a comfortable stable till she gets entirely well. Blue vitriol, corrosive sublimate, turpentine, or kerosene oil, are very bad to apply to a wound. The two former are poisonous to raw flesh and we fear have injured the limb, but it may have escaped.

Miscellaneous.

C. E. C., Forestville, Ia., asks the best work on cattle, horses, sheep and swine—their diseases, breeding, etc.

ANS.—We know of no single work that embraces all the above information. The best work on diseases of domestic animals, which can be got at a reasonable price, is Law's Farmers' Veterinary Adviser, price $3. Allen's American Cattle, price $2 50 is an excellent work on cattle. Mayhew's Illustrated Horse Management, price $3, is a good work on the subject of which it treats. Stewart's Shepherd's Manual, price $1.50, is the latest and best work on sheep. Coburn's Swine Husbandry, price $1 75 is a late and good work on swine. Miles's Stock Breeding, price $2, gives the latest information on the principles and practice of stock breeding. The above works would be very useful in every farmer's library. All can be obtained from the American News Co., N. Y. City.

P. T. J., Victoria, British Columbia, asks whether any of the fruit driers noticed from time to time in the RURAL could be used for drying cones of the native conifers, of which he collects a considerable quantity; and if fruit driers are suitable for this purpose, whether we know of any made in Canada, as it would be desirable to save the 25 per cent. of import duty levied on American machinery introduced into the Dominion.

ANS.—The fruit driers would answer perfectly for drying fir cones or any kind of seeds, care being taken not to run the fire too high. To be safe in this particular, a thermometer should be hung in the shaft near the lower trays and the heat should not exceed 125 degrees. We cannot learn that fruit driers are made anywhere in the Dominion.

J. E P., Braidwood, Ill, asks how the milk of Holstein cows would compare with that of Jerseys for butter making.

ANS.—We do not remember the particulars of any experiments made to decide in a definite manner the relative proportion of butter obtainable from the milk of Holstein and Jersey cows. The Jersey, however, is the "butter cow" *par excellence*, her milk usually yielding a larger percentage of butter, and that of a better quality, than the milk of any other breed. The Holstein milk is better for cheese-making or marketing than for butter-making; as the yield is large and pretty rich in caseine. A good deal, of course, will also depend on the feed of the cows.

J. W., Rock Falls, Ill. sends specimen leaves of a plant which he thinks may be either a magnolia or a hibiscus, and asks our opinion.

ANS.—It is either Hibiscus militaris or H. Moschentos—we cannot tell which from the specimen.

C. M., Marquette, Kan., kindly furnishes figures to show that our yield of Chester Corn could not have been as great as represented. But he overlooks the facts that it was planted in drills; that many grains produced more than one stalk and that the drills were not four feet apart.

C. M. H., Pleasant Grove, Minn., asks where can he get cranberry plants in the Spring, and how to set them out.

ANS.—In noticing the nurserymen's catalognes just about to be issued, we shall call attention to those parties who sell cranberries. A full account of the manner of planting them, etc., was given in the RURAL of Dec. 4th last, under the caption "The Cultivation of the Cranberry." We must refer our correspondent to this article, as it is really too soon to repeat the instruction given therein.

W. W., Utica, Dakota Territory, asks whether Blount's Corn and the Chester County Mammoth Corn would be likely to ripen in that latitude, and where can he get seeds of both.

ANS.—Trial alone can decide the matter definitely. Only a small patch of each should be planted at first. In noticing seedsmen's catalogues, we shall mention those who will have seed for sale. It will also, no doubt, be advertised in the RURAL in ample time before the season for planting.

C. C., Damascus, Pa., asks for a full history of the Chester County Mammoth Corn.

ANS.—We have told all that we know respecting "Chester" Mammoth. It was bred in Chester Co., Penn.—by whom we know not. It required last season not less than 110 days to mature. The cobs are large, the stalks heavy and tall—perhaps they will average nine feet.

L. H. E., Chapman, Kan., asks how to get the seed out of Osage Oranges without using a machine.

ANS.—The seeds of the Osage Orange can be obtained by rotting the orange and washing away the pulp.

COMMUNICATIONS RECEIVED FOR THE WEEK ENDING SATURDAY, JAN. 22.

J. B. W.—J. T.—D. S. D.—D. Rtee—thank you. The corn is not yet received.—M. H. C.—N. J. S.—S. E. V.—B. F. T.—W. E V., we can not furnish prices—we do not sell—A. B. THE
Rural New-Yorker,
PUBLISHED EVERY SATURDAY.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 Park Row, New York.

SATURDAY, JAN. 29, 1881.

The present Free Seed and Plant Distribution of the Rural New-Yorker will be begun in a few weeks. It is our desire and intention to begin it earlier than we were enabled to do last year. We are now only awaiting the arrival of seed from France ordered a long time ago. We have already sent out the White Elephant Potato to many, availing ourselves of warm spells. If not received in a perfect condition, friends will please notify us by postal card.

The Hardy Shrub and Tree Special will be (probably) the second number in February. In it we do not propose to speak of new plants—except incidentally—but merely of those good, well-tried hardy trees and shrubs which have proven themselves to be, for general purposes, the best in cultivation.

The next Rural Special will follow in about three weeks. This will treat of Small Fruits—especially of strawberries, grapes and raspberries.

The next Special will be our Wheat Number, to be published in August next.

LABOR AND CAPITAL AT THE SOUTH.

The Mississippi Valley Cotton Planters' Association is marking out a new line of action for Southern planters and their hired help, that must commend itself to the judgment and good wishes of all. At the meeting of this Association held at Vicksburg, on the 18th, a paper was read explaining the effort the society is making to discard the present system of labor whereby the crop is raised on shares, and to adopt one of wages only. The former plan has always worked to the disadvantage of the colored laborer by encouraging his too willing disposition to discount his future prospects. The plan proposed to replace the present unsatisfactory labor system is to have each county bordering on the Mississippi River choose one white and one black man from among the ablest representative men of their respective classes to attend the May meeting. The other matters for consideration will be the best cotton machinery, and, above all, the best plan by which the white man and the black can make more money planting cotton. This Association was organized in May, 1879, for the purpose of remedying the existing evils in the labor system of the South, and the members are to be commended for their good sense in adopting this truly American method of remedying existing evils by joint action between those who own and those who work the soil.

DANGER FROM IMPORTATIONS OF FOREIGN CATTLE.

Foot-and-mouth disease is again spreading in England. Stringent measures of prevention have been adopted in Norfolk, Suffolk, Essex and Middlesex, forbidding the holding of the weekly fairs or the movement of live stock without license. It is feared the present outbreak will prove the most memorable of epizootics. This disease, though not usually fatal, is highly contagious and belongs to the group of eruptive fevers of which cattle plague, small pox and pig typhoid are the more formidable and destructive members. When this malady once becomes epizootic, its march is almost irresistible. In the county of Suffolk alone in one week, 1264 head of cattle, 719 sheep and 157 pigs were reported as attacked. The number that died is not stated, but the loss to the farmer consists not so much in actual death as in great depletion of flesh and loss of milk. Every precaution consistent with the public interests should be taken by our law-makers to prevent this disease from reaching these shores. We understand that the consignment of Jersey cattle whose arrival in this port is mentioned elsewhere in this issue, show unmistakable signs of this disease, and they have been quarantined for 90 days.

AN IMPORTANT PATENT DECISION.

Experience has shown that by far the best method of conveying meat in refrigerator cars or on board ship, is one by which the meat is subjected to a continuous and equable current of cold air. The Bate Refrigerator Company of this city claim the exclusive right, under their patents, to ship meat in this way, and some time ago instituted a suit against Toffey Brothers, the extensive Jersey shippers of dressed meat, for infringement of their patents on the system. Last Wednesday, the 19th, Judge Nixon, in the United States Circuit Court of New Jersey, held that the Bate Refrigerator Company's patent gives it the exclusive right to the above process, and entered a decree against Toffey Brothers. From this decision the case may be taken on appeal to the United States Supreme Court, and in view of the vast dimensions which the transportation of meat on railroads and steamships has reached, and the large interests involved in the case of a multitude of shippers, it is not improbable that an appeal will be made, should there be any hope of success. In any case, the Bate Company should charge only a moderate royalty for the employment of its process; for any impositions which would virtually give it a monopoly of the trade, would be against the public interest, to promote which is the design of our patent laws. Should the Company's greed induce it to make any exhorbitant charges, the Courts should see to it that the public welfare is not injured by the Company's rapacity. In cases where, as in this, national interests are involved, the patent laws should be so amended that the rights covered by a patent should become public property at once on the payment to the patentee of a fair compensation for his labor, outlay and ingenuity, out of the National Treasury.

DESTRUCTION OF SEEDED WHEAT BY A FUNGUS.

One of the most extraordinary cases on record of the non-germination of Winter wheat is reported to have occurred in Europe. A field of this grain, which had been sown the previous Autumn, having manifestly failed, the owner set about plowing the land in the Spring, and to his surprise turned up ungerminated grains of wheat which were as large as horse beans—say more than half an inch long. Even after these great, swollen kernels had dried they were considerably larger than ordinary wheat, since they measured from one-third to one-half an inch in length and two or three-tenths of an inch in breadth. This abnormal grain was of a grayish-yellow color and was shaped something like an elongated pear, the thinner end or neck being sometimes a tenth of an inch long. It was easy to peel off the skin of the grain in spots. In many cases a bundle of slender roots, half or three quarters of an inch long, were attached to the thin end of the grain.

Under the microscope, it appeared that the mycelium of a fungus (that is to say the thread-like organ which is to the fungi what rootlets are to ordinary plants) had invaded the grains and consumed their gluten, starch, and other nutritive constituents; and that the presence of the great mass of mycelial threads had caused the wheat-kernels to swell to such unnatural size. There was reason to believe that the advent of dry weather in the Autumn had been unfavorable for the full development of the fungus so that its growth was arrested before it had reached maturity, otherwise the wheat kernels would have been more fully destroyed, and the mycelium itself would have shrunk away more or less completely when the fungus had reached the period of fruition and the object of its life had been fulfilled.

AGITATION NOT ENOUGH.

The adulteration of food has deservedly attracted a great deal of attention of late. Boards of Trade all over the country have been passing resolutions against the evil; associations have been formed in some of out chief cities with the special object of combatting it; the National Board of Health has offered a premium for the best draft of a law to suppress it; the Governors of several States, in their messages to the Legislatures, have urged more stringent criminal legislation to suppress it; a number of bills directed against it have been introduced into the Legislatures of some of the States, and others have already passed similar measures; Congress, too, has a couple of bills before it; but in the face of this widespread agitation the evil is increasing steadily and boldly. Oleomargarine and suine, its newly discovered congener, have been objects of special denunciation, but the manufacture and sale of both have been growing rankly.

It is to be hoped that the present agitation will not subside until some effective method has been devised for punishing not only adulterations injurious to health, but also the foisting upon the public of goods under false and deceptive names. The passing of laws, however stringent, is not enough to accomplish this end, unless precautions are taken that they shall be rigidly enforced. In this State the law requiring the seller to have packages of oleomargarine marked with the name of the concoction is virtually inoperative from negligence in enforcing it on the part of the officers whose duty it is to see that the requirement shall be carried out. The dealers in genuine butter, also, should not confine their efforts against the fraudulent sale of the spurious article to mere denunciation and spasmodic prosecutions of offenders, but in every town they should imitate the example which, we learn, is now being set by all the reputable butter dealers of Chicago, who have pledged their word not so sell a pound either of hog or bullock butter.

THE FALL OF LIMA.

Lima has fallen. The Peruvian capital has been captured by the Chilians after a fierce battle in the suburbs, and the victors can now dictate terms of peace to the vanquished. At the commencement of the triangular contest between Chili and the allied republics of Bolivia and Peru in April, 1879, the population of Chili was only about equal to that of Bolivia, while Peru's was considerably larger than that of either. The standing armies of the allies were double Chili's. The navy of Peru was powerful in contrast with that of her opponent. Nearly every civilized nation had an interest in the products of her mines and her niter and guano beds, and might be relied on to advance money liberally and to impede the success of her antagonist.

It was doubtless these considerations that induced her to support Bolivia in her breach of treaty with Chili with regard to the Atacama niter beds and the guano deposits of the Bay of Mejillones. By a treaty, ratified in '74, both republics were to share equally the guano deposits, and for 24 years the Chilians were guaranteed the liberty of exporting niter and other minerals from between the latitudes of 23 and 24 without an increase of export duty.

On the alleged failure of the Chilian contractors to comply with the terms of their bargains, the Bolivian Congress, in February 1878, laid an export duty of ten cents per 100 pounds, upon the Chilian exports of niter. The protests of Chili were disregarded, and the plucky little republic at once seized upon Antofagasta, the chief Bolivian port from which the nitrates were exported. Peru, jealous of the spirited rivalry of Chili in the fertilizer trade, sided with Bolivia, in the confident expectations of an easy victory and a monopoly of the niter and guano resources of the country. Chili, not a whit daunted, promptly declared war against this new enemy, anxious to defer hostilities until she had made better preparations for the contest.

From the outset the armies of the Chilians have been uniformly successful on land, and, with the exception of the early brilliant achievements of the Peruvian iron-clad Huascar, and a few losses from torpedoes, their fleet has been equally victorious at sea. While their army pushed vigorously northward, gaining victory after victory and forcing the defeated Bolivians to seek shameful safety in their own country, the fleet devastated the Peruvian coast and levied heavy contributions on its panic-struck inhabitants. Their brilliant successes, crowned by the triumph of January 17th, considering the poverty of their resources and the small number of their population, place the Chilians high among the military nations of the world, and give them the hegomony, or leadership, of all the South American Republics.

A few months ago an attempt was made, through the mediation of the United States, to conclude a peace between the belligerents, but as the Chilians insisted on the cession to them of the territory of Atacama, about which the dispute arose, as well as on a pecuniary compensation for the expenses of the war, the terms were deemed too severe, and were consequently rejected. Although many of the wealthiest provinces of Peru are east of the Andes, and therefore still untouched by the ravages of war, yet there is little doubt that peace will be soon forced upon the humiliated people. After the additional outlay and bloodshed the terms imposed by the victors will be hardly less severe than those formerly offered, and will probably include the cession by Peru of the Province of Tarapaca, with its great mineral and fertilizer wealth, in addition to the annexation of the part of Atacama claimed by Bolivia, together with several of the Peruvian seaports.

Such an agreement would give to Chili almost an entire monopoly of the vast nitrate resources of South America and a preponderating share of its guano wealth, and must therefore be of interest to the agriculture of the world. Foreign nations, however, may interfere in the settlement of the terms of peace, in defence of the interests of their subjects, who have made large loans to Peru on the security of her nitrate and guano deposits. There is a report in this city that a syndicate of wealthy speculators have within the last month concluded an agreement with Peru by which they obtain entire control of all her guano deposits for a term of twenty years for twenty million dollars, five millions of which have already been paid. Should the report prove correct, as Americans we may rejoice that our own citizens have superseded the English in control of this lucrative business; but as farmers we shall probably have no cause for exultation, as experience has taught us that American capitalists are as eager as the greediest foreigners to wring the greatest profit from the American farmer.

BREVITIES.

Correspondents will greatly oblige us if, by postal, they will state what effect the extremely cold weather of the past few weeks has had on fruit buds and trees.

The Board of Control of the New York Agricultural Experiment Station at their meeting held at Albany on the 19th inst., adopted a report embracing the feeling of the Board to establish the station upon a farm, and to give field experiments a higher place than laboratory work. The Board is now ready to receive proposals from those who have farms to sell or give away.

A new disease, locally called "black plague" is proving very fatal among hogs at Floyd's Neck, Long Island, near this city. None of the affected animals have hitherto recovered, all having died a few hours after the beginning of the attack. Some suppose it to be one of the several forms of disease grouped under the name "hog cholera;" while others prefer the expressive name of "black plague." It has created quite a commotion among neighboring farmers, who are taking stringent precautions to prevent it from spreading.

Hildreth & Sons, large sugar refiners of Philadelphia, last year contracted with farmers of Cumberland and Cape May Counties, New Jersey, for 250 acres of Minnesota Amber Sugarcane for refining purposes. This was in an experimental way only. The results were so favorable that they have this year contracted for 2,500 acres more, and intend to plant 2 500 acres on their own account, and have put up new machinery for the purpose of working up this immense quantity of cane. They pronounce the cane grown in New Jersey much sweeter than that grown at the West, and it can consequently be worked up more economically.

Hot house Strawberries sold here at the opening of the season, a few days ago, at $7.50 a quart wholesale; but they have since fallen to $6 wholesale and $8.50 retail. A cup containing about 20 berries sells for $2 wholesale and $2.50 retail. As sold in the stores, the berries cost about fifteen cents each. The fruit is raised chiefly in New Jersey and brought to market by special messengers, it being too precious to be trusted to the express companies. Champion and Jucunda are the principal varieties raised. The demand is greater than the supply just now, as may be inferred from the prices. Private citizens are the chief purchasers, as the best restaurants and hotels will not buy until prices have dropped to about $3 per quart. The season is late this year, the previous one having opened about the middle of December. It will last until early in May, though Florida berries are expected to come into competition about the first of March. Last year they came into market early in February, but owing to the cold weather in the South, they will be later this year.

Rumored "Corners." There is a report in this city that a "corner" in oats either has been completed or is in course of formation. Prices, however, have not advanced as they usually do when the "bull" movements which result in "corners" occur. The price of oats, however, is high now, and it may be that the upward rush may be deferred until the "shorts" are being squeezed at settling time. All that is certain is that several large operators in the Produce Exchange have lately been heavy buyers of oats. This may have started an idle rumor about the "corner"—or a correct report. From Chicago comes another rumor about a prospective "corner"—in wheat this time. Now that the needs of foreign markets, and the surplus supplies of other countries are pretty accurately estimated, it is thought that speculators have sufficient data on which to manipulate the market. There is a great deal of capital idle or drawing only a very small interest, the speculative feeling throughout the country is unusually lively, and both *may* find employment in trying to corner wheat. It seems to us, however, that there is too much of this still in the hands of producers and dealers to be controlled by any syndicate. Moreover, the outcome of last year's corner, despite the short crops in Europe, was not such as to encourage a similar movement this year in face of an increased production at home and abroad, and hence a less demand.

Literary Miscellany.

WAITING.

With waiting and wishing our courses we pave;
We wait for the port as we battle the wave;
'Tis waiting forever from cradle to grave.

Waiting for morn, so serene in its light;
Waiting for noonday, so brilliantly bright;
Waiting at eve for repose in the night.

Waiting for zephyrs in Springtime that blow;
Waiting for Summer and flowers that grow;
Waiting for Winter and swift-falling snow.

Waiting is ever the bosoms's refrain,
In moments of pleasure and moments of pain;
Waiting, though stricken again and again.

Waiting in childhood for youth's joyous time;
"I'm waiting," says Youth, "but I'll certainly climb
To the top of the ladder on reaching my prime."

In manhood awaiting the time when he may
Find rest on a calmer, a happier day,
When age shall relieve from the worrying fray.

Waiting when fortune sheds brightly her smile;
When choice are the pleasures the pathway beguile,
There always is something to wait for the while.

Waiting in poverty, anguish and grief;
Waiting for heaven to send us relief,
Telling the heart that the trial is brief.

Aye, waiting for joys that will never appear;
Waiting for voices we never shall hear;
Waiting for moments that never are near.

Waiting when sinning and worn in the strife,
With penitent throbbings the bosom is rife,
Waiting the dawn of a holier life.

Waiting at last for the spirit's release;
Waiting a rest in the dwelling of peace,
Where waiting and longing forever will cease.

INMATES OF LESTER HALL.

NOTICE.

[The installment of the story which belonged in the "Corn Number" but was crowded out to admit of practical matter, was also omitted in the two succeeding issues, making an omission of three chapters; we now insert them. "Mistakes will happen in the best regulated families;" this is the consolation we give ourselves, hoping for equal consideration from our patrons. R. C.

CHAPTER XXVII.

Mr. Edgar's house was tolerably well filled. There were eight pretty bridesmaids, who were to follow Cecil up the aisle of the pretty village church, in wonderful costumes of cream and blue, with hats to match—the attendant groomsmen, and the usual complement of aunts, and uncles, and cousins, who were anxious to see the bride and the presents, and how Ernest would comport himself under these trying circumstances.

The presents, which were numerous and costly were arranged for general view in the dining-room; and the guests went into raptures over the suite of diamonds and the superb Indian shawl, which were the gifts of the prospective father and mother-in-law. Mr. Daton, too, had loaded his niece with gifts, and altogether the display was a very costly one; while as for the trousseau, it was perfect.

Dresses from Worth, bonnets from Elisé, boots from Pinet's, and gloves from Jouvin, were among its beauties; for greatly to Mattie's surprise, Cecil had gone into the business of her trousseau with feverish energy after cool deliberation.

It was only when the wedding-day drew near that her spirits seemed to get so uncertain; although she had altered in appearance, and the beautiful color which had made her so lovely had entirely disappeared, leaving her white as marble.

Ernest was to arrive on the evening before in time for dinner; and when Mattie received him in the hall, she whispered to him that Cecil was in the boudoir alone, and that there was still ten minutes before the dressing-bell; Ernest thanked her smiling to himself as he went upstairs. At the head of the stairs he met a dainty little figure already dressed for dinner, and looking up he saw a sweet young face, which blushed under his admiring gaze.

"An unexpected pleasure, Miss Lottie," he said, gaily, as he held out his hand. "I did not know you were here."

"Did you not?" she answered, smiling: for pretty Lottie Tyrrell had battled with her feelings for Ernest, and was able to give him a greeting frank and friendly as his own. "Did not Cecil tell you?—we are great friends, and she wishes me to call her Cecil—that I was to be one of her bridesmaids?"

"No, she did not tell me, but I am delighted to hear it. Is Cecil in Mrs. Edgar's boudoir?"

"I think so, some one said that she was," said Miss Tyrrel, as she went on her way, and Ernest went on his, entering the boudoir where Cecil awaited him, with his face all aglow with love and eagerness.

"Well, my darling," he said, as he took her in his arms, and turned her face to the light; then he started back in alarm. "Cecil, what have you been doing to yourself?"

She smiled a strange, forced smile.

"How? In what way, Ernest?" she said.

"You look so white and ill! Dearest, you have not been ill? How dared they keep it from me?" he said, passionately. "What have they been doing to you here?"

"My dear, Ernest," Cecil said, laughingly, "try and be reasonable, even if to-morrow will be your wedding-day. I have not been ill—I never was better—so they kept nothing from you—and they have been doing nothing but petting and spoiling me, and sending us so many presents, that we shall be able to stock a jeweler's shop and a fancy repository."

"But, Cecil, how pale you are!"

"Am I? well, am I not always rather livid?" she said, gaily. "Ah! there is the dressing-bell, and the bride elect must make a favorable impression to-night, you know; so *au revoir!*"

She loosed his grasp on her hands, and fluttered away out of the room; and when he saw her again, it was in the drawing-room, surrounded by her friends, and there was no chance of private conversation.

Cecil was feverishly gay all that evening—so gay, that more than one compliment was paid her on her high spirits; and Mattie's eyes followed her anxiously as she moved about the ball-room—very pale, but with feverishly bright eyes and bright smiles, which to Mattie's tender scrutiny seemed forced; she grew so uneasy at last, that she went over to Ernest, who was standing a little apart from the dancers.

"I am afraid Cecil is overdoing it," she said, in a low voice. "Take her into the conservatory and make her rest a little, or she will be quite overcome."

And Ernest obeyed her request so well and promptly, that in a few moments Cecil found herself seated in a cushioned armchair in the conservatory, with Ernest alternately scolding and caressing her.

"I wish I had a right to order, and that you were bound to obey," he said, smiling.

"What would you do?" said Cecil, languidly.

"I would order you off to bed," he said, "A very disinterested prescription, is it not?"

"I should not obey you—I don't want to go—I want to make the most of my freedom," said Cecil, with a dreary laugh. "Ernest, are you in a great hurry to put yourself in bondage?"

"To such a gaoler—yes," he answered, smiling tenderly. "Cecil do you know that I am very anxious about you? You used to be a substantial little woman; now I should not be surprised if you were to melt away before my eyes. Just look at your hand."

"Almost like a claw," she said, laughing. "Never mind, Ernest, by-and-by I shall astonish you by recovering quickly. And now, like a good fellow, go and get me some lemonade or something cold to drink—I am parched."

When Ernest returned with the lemonade, Cecil had disappeared; and in a few moments Mattie told him that she was very tired—had gone to her own room, begging that she should not be disturbed again.

And while the dancing went on down stairs, and Ernest was thinking of the great happiness in store for him on the morrow, Cecil Lester—the happy bride-elect, the envied, admired beauty—lay prone upon the floor of her dressing-room, burying her head in her hands, and moaning in an agony too deep for tears.

How that night passed she never knew; the girl's brain seemed on fire. She threw open the window; it was a wet night and the rain poured down upon her bare head and uncovered shoulders, as she leaned out, unheeded. Her head burned, her temples throbbed; fears, recollections, buried hopes, surged round her like the waves of a troubled sea. She tried to grow calmer; she at last retired, but she had no power to arrest her thoughts. The remembrance of her last interview with Lawrence Carewe continually came before her, and the bitter thought of the terrible wrong she was about to commit haunted her. But it was too late to draw back now—she could not, she dare not do it! Once or twice she started up with the intention of seeking her uncle, or Mattie, or Ernest, and praying them to put off the marriage; but she sank back weakly on her pillows, faint and terrified at the very thought.

The dawn broke, the sunshine stole into the room, but Cecil's aching eyes were wide open; sounds of the household moving about with unaccustomed activity and bustle reached her faintly. By-and-by her maid came in with some tea, from which Cecil turned in loathing, and then Mattie entered, on her way down to breakfast, and stooped over her, kissing her fondly, and whispering "I hope you will be very happy, my Cecil," and told her, smiling, that she must not appear until she came down to go to the church; and went away with an ache at her heart, for Cecil had answered nothing, but her eyes had followed Mattie with an unutterable wretchedness, which it was fortunate or unfortunate Mrs. Edgar did not see.

CHAPTER XXVIII.

"May I come in, Cecil? You said I might put on your wreath, you know," said Lottie Tyrrell's voice at Cecil's door a few hours later; and Lisette opened the door, admitting the young lady with a rather dissatisfied countenance, as if she resented this encroachment on her privileges, took the wreath of orange-blossoms from its box, and handed the lace veil to Miss Tyrrell.

Cecil was seated before her dressing-table, dressed in the rich white satin and Brussels lace that formed her bridal-robes, and she did not move or look round when Lottie fluttered in, looking "as pretty as a picture," and very like one in her quaintly-made dainty costume. All through the dressing operations she had remained silent and passive as now, allowing the maid to have her will in all things—neither suggesting, nor taking any heed of the Frenchwoman's rapturous exclamations of admiration. Her eyes were fixed on the glass before her, but she saw nothing of the beautiful face reflected there; and once or twice Lisette had been startled by the ghastly pallor of her young mistress, and the heavy inertness of all her movements. Lottie also noticed her extreme pallor, and glanced at the maid with some alarm; then, having consoled herself by the reflection that brides are generally pale, Lottie took the veil, and began arranging it on the glossy braids of hair over which Lisette had expended so much time and pains. The beautiful filmy material fell in soft, fleecy folds over the motionless form, and with a delighted exclamation, Lisette took up the wreath and settled it into its place.

"Oh, how lovely!" she said, rapturously. "Cecil, how beautiful you are!"

Cecil did not speak for a moment; then she rose unsteadily, lifting her hand with a troubled gesture to her brow.

"How heavy it is!" she said, and her voice had a strange, hollow sound. "Lisette, open the window!" she added sharply; "I am stifled here!"

Lisette rushed to the window, too much startled to open it immediately; and when her trembling fingers were fumbling with the fastener, Cecil cried again, in the same hoarse, strained voice:

"Quick! give me air! Do you not see that I am choking?"

Her voice failed; her hand, which had been clutching convulsively at her throat, fell heavily on her side; she made a step or two forward towards the window; then stopped, swaying to and fro.

"Lisette! Lisette!" said Lottie, in terror, "she is ill! Oh, come, come!"

Lisette rushed to her mistress's side, and both girls tried to support Cecil as she sank back, her beautiful flower-crowned head falling inert and heavy against Lottie's shoulder; but their strength was not equal to the heavy weight of a person in a dead faint, and they were obliged to lay her on the floor, where she lay in all her bridal finery like one dead.

"Oh, Lisette, what shall we do?" said Lottie Tyrrell, bursting into tears. "How dreadful she looks! Do you think—do you think—do you think she is dead?"

"Dead!" echoed Lisette, contemptuously, as she caught up a bottle of salts and held it up to Cecil's nostrils; "of course not! She has fainted, mademoiselle; I have seen mademoiselle faint like this before once or twice. Rub her hands, Miss Tyrrell. Give me the cologne."

But all their efforts were vain; water was dashed on her face, to the destruction of the soft lace about her throat; her forehead was bathed with cologne, strong ammonia was held to her nostrils without effect; and, thoroughly startled and alarmed, Lisette rushed off for Mrs. Edgar, who had fortunately not started for church, and who came hurrying along the corridors, white and trembling in her pretty velvet dress, and who fell on her knees beside her sister's still form with a little cry of despair.

"Oh, Lottie, this is terrible!" she sobbed. "Run and find Edgar and tell him to send a groom for Dr. Collins at once. I am afraid she is very ill."

Lottie flew off, and in a very few moments the whole house was in confusion; most of the guests had already started for church, but those who remained were full of all kinds of suggestions and advice; the maids were running about in equal activity and confusion, and when Edgar had sent one mounted servant for the doctor, and another to Mr. Daton, who was already at the church, he went upstairs to his wife.

Cecil was still perfectly unconcious on the floor, but with Edgar's assistance she was lifted on to the bed, where she lay like a drooping flower, broken at the stalk, without the slightest gleam of consciousness on her marble face. With very gentle hands Lisette removed her veil and wreath. It was but too evident that there would be no wedding that day.

As quickly as it was possible Dr. Collins came galloping up the avenue, riding the horse of the man who had been sent for him; and almost simultaneously a carriage dashed up, out of which sprang Mr. Daton and the bridegroom-elect, both of whom followed the doctor into the room where Cecil lay.

CHAPTER XXIX.

CECIL'S TRIAL.

The gray evening shadows had come, and a mournful silence spread over the house which that morning had been so full of pleasant confusion and excitement. The greater number of the guests had departed, and the very few old friends who remained were gathered in the drawing-room, talking with grave faces and low voices of the untoward event of the morning. Outside Cecil's door, crouching on a low window-seat, sat Lottie Tyrrell, weeping and watching and within a mournful group were gathered round the bed on which Cecil still lay, white and motionless.

They had removed the heavy white satin robe, and replaced it by a wrapper of pale blue flannel; one hand lay by her side; Ernest, seated at the bedside, looking the picture of despair, held the other, and now and again he stooped and pressed his lips to it; Dr. Collins, grave and absorbed, stood at the foot of the bed; and Mattie leaned over her sister, watching for the first sign of animation on the lovely marble face. The room was very still and silent, and had been so for some time, when Dr. Collins, with a little sigh of relief, said, softly:

"She is coming to herself. Stand back a little, my friend, she must not see you."

Ernest drew back slightly as the heavy eyelids quivered a little, and then were lifted slowly from the large eyes, which looked straight up vacantly at the ceiling for a moment; then they fell upon Mattie's anxious face.

"What is it?" she said, faintly. "Where am I?"

"Here at home, dear," whispered Mattie, with a break in her voice.

"With you, Mattie?" said Cecil's white lips.

"With me, darling."

"I am not married?" with a quick look of alarm and terror.

"No, dearest!"

And with a faint, sobbing gasp, Cecil fell back on her pillows again, white and still.

"You had better leave us, Mr. Eleston," said Dr. Collins, quietly. "When Miss Lester comes to herself she must be kept perfectly quiet, or I cannot answer for the consequences."

Ernest rose immediately and left the room, his face pale, his lips quivering. As he paused outside the door to regain some semblance of composure, a little figure sprang up from the window-seat, and put a small trembling hand on his arm.

"Is she better?" said Lottie, tremulously.

"She has spoken," he answered hoarsely.

And looking into his white, suffering face, Lottie's eyes filled as she said, softly:

"Oh, I am so sorry for you!"

He looked down at her sadly, and took the little hands in his as he stood silent, his pale face working with pain; then he moved away taking Lottie with him.

"Dear Ernest," she said, gently, "do not grieve so. She will be better soon and all will be well."

In a few minutes he raised his head.

"I feel as if I had lost her," he said, brokenly. "Thank you, little friend. Forgive me for having distressed you."

He stooped down again and touched the little hand lightly with his lips, and went away, while Lottie ran off to her own room, excited and trembling.

All that night Cecil Lester was very ill; she recovered from one long fainting-fit, only to fall into another, and the next morning her weakness and debility were so extreme, that Dr. Collins peremptorily forbade any visitors in the sick-room, except Mattie and Lisette.

"I have been questioning Miss Lester's maid," he said to Mattie, when they were alone, "and I am not at all surprised at her mistress's illness. The state of excitement and sleeplessness in which she has been for days—nay, weeks past—is more than sufficient to account for it. Extreme quiet is the best medicine for her now."

Cecil made no opposition; indeed, had she wished to do so, she was too weak. She lay still and passive, hardly ever speaking, and taking nourishment from her sister's hand without a word. She seemed to have lost all interest in outward things; but once, when Lisette made some lamentation about the magnificent wedding which had been spoilt, and the beautiful wedding-dress from Worth, which was damaged by the water which had been sprinkled over it, a quick shudder ran through Cecil, and she turned hastily to her sister.

"I am too ill to be married, Mattie," she said, petulantly, "much too ill."

"Yes, yes, my darling," said Mattie, reassuringly, although her heart ached for Ernest, who was anxiously expecting a summons to Cecil.

On the third day Cecil was able to be lifted from her bed to the sofa in her dressing-room, and on the following day Dr. Collins gave permission to receive visitors—to Ernest's great delight and Cecil's chagrin.

"I wish he had left me in peace," she said, pettishly. "I am not strong enough. Mattie, don't leave me alone with Ernest."

Mattie made no answer for a minute or two, but fidgeted uneasily about the room for a moment; then she came to her sister's side and knelt down beside her.

"Cecil," she said, gently, "are you behaving quite fairly towards Ernest? Dear, if you have anything to say to him, had you not better lose no time?"

Cecil's lip quivered.

"Mattie—if I could spare him," she said, brokenly. "Oh, sister, how hard it is that others should suffer for our sins!"

"It is hard, my darling," said Mattie, tremulously, and although no other word passed between them, Mattie knew that her sister would never be Ernest's wife, and her eyes filled as she saw the look of delight which flashed into his face when she told him Cecil could see him.

"He is very young; that is his only chance of forgetting," said Mattie to herself, softly, when she was alone. "But as it is, it will go very hard with him."

(Concluded from page 58.)

CHAPTER XXXV.

Her appearance was followed almost immediately by that of Jenkins with the tea-tray, and Cecil went over to the little gipsy-table, and began to pour out tea in silence. The red gleam of the fire playing over the room fell upon her as she sat there in her somber black dress, on the beautiful weary face, and on the white thin hands, which were moving among the dainty china and glittering tea apparatus. The pretty room itself looked very comfortable and homelike; Mattie, in her low chair by the fire, looking so bright and pretty, was glancing occasionally at the clock to see how soon she might expect Edgar, who had gone to the city with Mr. Daton. Ernest was standing by Cecil, taking his cup of tea from her hand, when there was a sound of steps on the stairs, and Cecil half rose, trembling, with the red, hectic flush on each cheek.

"There is some one with Uncle Henry," she said faintly, and Ernest glanced at her, surprised at her agitation and manner.

"It is Edgar, dear," said Mattie, hastily. "You know they were to return together."

But Cecil did not answer; she stood erect by the little gipsy-table, leaning one hand upon it, the other pressed against her heart, while her breath came in quick, short gasps from her pallid parted lips. The footsteps came nearer; there was a pause, and the sound of talking on the landing without, then silence, and Cecil turned to the tea-table again.

"I beg your pardon," she said, faintly, "I am so absurdly nervous!"

She lifted a cup of tea in her weak hands to give to him, but at that moment the door opened, and Mr. Daton came in quietly, but his ruddy face was looking pale and agitated as he went forward to Cecil's side.

"Cecil," he said, hurriedly; but before he could continue, Cecil screamed out as if she had been shot, rushed forward, and the next moment she was in Lawrence Carewe's arms, clinging to him and uttering inarticulate sounds of joy; and while she was looking up into the beloved face, a blinding mist came before her eyes; the white lids drooped; the dainty head fell upon his shoulder—Cecil had borne her sorrow, but she had not strength to bear her joy—she had fainted away!

CHAPTER XXXVI.

NOT A DREAM.

Cecil's swoon was not of a long duration: in a very few minutes the white lids were lifted from the beautiful eyes, and she looked up questioningly at Mattie as she bent over her; then her eyes

went to her uncle's face, as he stood at the foot of her sofa.

"Forgive me," she said, faintly, "Uncle Henry, I was very foolish; but I thought—oh! it was such a happy dream! Mattie," with a faint, slow smile, "why did you waken me?"

"It was no dream, my child," said her uncle, tremulously.

And Cecil started up from the pillows, and found herself supported in Lawrence Carewe's arms.

"It was no dream, my darling," he whispered, tenderly.

Cecil put her arm round his neck like a tired child, and wept her heart out on his breast.

When she lifted her head at last she met the grave gray eyes she had never thought to see again fixed with tender anxiety upon her. She felt his arms around her, and there came a wild wish into her heart that moment—that she might die thus in his arms, with his lips pressed to hers his face the last sight on which her eyes should rest.

"It is no dream," she said at last, in a low, hushed voice. "You have come back to me, Lawrence; it is you—yourself!"

"Even so, my darling," he answered, gently. "It is no dream. Oh, Cecil," he went on, brokenly, "such a welcome almost breaks me down! Are you really so glad?"

"Glad," she repeated. "Lawrence, you know—"

She leaned her head upon his arm, with a long, blissful sigh, and they were silent—silent in such happiness as falls but seldom to our lot here; and surely when it comes it shadows forth the perfect joy of that other world of which we know so little, but from which we hope so much.

"Lawrence," she said, "are you sure, are you quite sure, that you have forgiven me? You have not come back to me from pity—they have not brought you here by telling you that I was dying for your love, dying for you!" The beautiful face was rosy with shame. "Oh, do not interrupt me—let me tell you how I have suffered, how I have suffered—as if I could tell you—as if I could tell you!"

"My darling, forget it," he answered, brokenly. "Forget all but that I love you—that I have never ceased to love you—that I will never leave you again, Cecil—if you will allow me to stay——"

"If I will let you stay! Oh, Lawrence, why did you ever go? Do you remember—ah, if indeed you love me a little still, you will not have forgotten last Christmas eve. I was broken-hearted—I could not bear your coldness and indifference; for I loved you—I loved you even when I sent you away from me with such bitter words. Oh, how I hated myself!"

"My darling—cease."

"No, I must tell you. I loved you even then, but I thought—how could I be so blind!—that it was you who had led poor Rex into sin; and I wanted to revenge my brother's death—but, even then, though I hated myself for loving you, I could not conquer that love; I thought I should be able to forget, but I could not—I could not. Then Mattie's letter came, telling me of the great mistake I had made, and you may guess what my life was then. Well, I wrote to you, and you forgave me—but I felt from the tone of your reply that you loved me no longer."

"If you knew—if you knew what it cost me to write to you so coldly, Cecil! I was too cruel, Cecil, and yet I dared not be otherwise; the temptation was so great. You remember"—smiling—"how I fled from it the next day, Christmas-day though it was?"

"When I thought you had gone away because you disliked the sight of me," she said, simply. "Oh, Lawrence, I never thought you could leave me like that! I was sure you would come back to me! Oh, how I waited and watched all those weeks! Although I could not break off my engagement, because you had told me to 'be pitiful,' But, at last, as my wedding-day drew near, and you had never come nor written, I was almost desperate; I never had a happy moment, except when I used to dream that we were together—you and I. Somehow, I never dreamed of you as angry with me. You always loved me, and your eyes looked at me as they look now; and I was so happy until I awoke—and oh! the awakening! To sleep, and dream that you loved me!—to awake, and find myself alone and desolate!"

'Cecil, Cecil, cease! It is over—we shall be happy now."

"Does it hurt you?" she said, gently. "Lawrence, did you think very badly of me that night? You said—you said you despised——"

"Do you care to know how much I love you?" he said, in a moment. "Ah! Cecil, I could not put it into words. When I was alone, and, as I thought, dying in the forest, my last thought was for you—my last effort was to try and find a photograph of you, which had never left me, and which I have still. If you had known that I treasured this above everything else I possessed, would you have believed, I wonder, those bitter words for which I cannot forgive myself?"

As he spoke he took from his coat the pocket-book which he had with him in the East, and from it extracted the photograph and the faded, blood-stained silken ribbon.

"Do you recognize them? The photo I bought; the ribbon you wore at your neck that night when I—I was so presumptuous," he concluded, rather at a loss, and unwilling to wound her.

"Oh, Lawrence!" and her lips quivered as her eyes met his, "did you love me so much, even then?"

He smiled as a man smiles in some sweet, happy thought, and Cecil went on, with passionate self-reproach:

"And you did not cease to love me when you knew how unworthy I was! When I had wronged you so deeply that no other love but yours would have outlived such a wrong! Oh! my dearest, how wicked you make me feel—how small my love seems beside yours! Lawrence, if I had known you as I know you now—if I had not been the veriest madwoman in my thirst for revenge—I must have known that you could not—you could not," she added, passionately and vehemently, "have done that which I thought you had done. Lawrence, how can you forgive me for all I have made you suffer?"

"Far easier than I can forgive myself for being so harsh, so cruel, so unjust. My darling, my own Cecil, it was very hard to see you at my feet—to hear your voice whisper 'Forgive,' and not to take you in my arms and pour out all my mad love for you."

"And what has that love brought you?" she whispered, softly—"exile, suffering, sorrow!"

"No, you shall not say so, Cecil," he answered, eagerly. "It was my own fatal pride which exiled me, not my love for you. As for the suffering, that is over now. I am well and strong again, and we need not dwell upon those weary months. Tell me rather of yourself. They tell me you are ill, and indeed I think you need looking after. I cannot have such a little white face as this, Cecil," taking it into his two hands and regarding it with loving, wistful eyes. "You must get well and strong for my sake, my darling. I could not"—he turns from her abruptly—"I could not lose you now."

"I could not leave you, Lawrence," she whispers, clinging to him fondly. "I could not die now, although I have been so happy to think I was ill; but there is a new life in me now, Lawrence—you are my life. How could I live if you were taken from me?"

How long these two foolish young people would have continued in a similar strain I do not know; but as a rule lovers are rather heedless of the lapse of time when they are together, and in the joy of such a re-union. Lawrence Carewe and Cecil Lester may well be forgiven for not hearing the dressing-gong, and for being entirely absorbed in each other, and quite above such mundane matters as dinner. But by-and-by Mattie came in, hurried Cecil off to change her dress, and then putting her two hands in her embryo brother's said heartily:

"There is no one to whom we could so willingly entrust her. I think if you had not returned Dr. Carewe, we should have lost her; but she looks a new creature, to-night, already."

And a new creature indeed Cecil looked, as she came down to dinner in her white robes, with a red rose in her hair, all sign of mourning laid aside; and though her cheek is still pale and her hand thinner than her lover likes to see them, but he is too clever in his profession to have any doubt as to Cecil's recovery, so that he is able to give full rein to his happiness, and is more brilliant and expansive than any one present has ever seen him.

* * * * * * * * * * *

The season that year, was an exceptionally gay one, and there were several lions eagerly sought after in society—an Eastern prince, the fame of whose jewels had become a byword; two belles whose triumphs recalled Cecil Lester's first season, an explorer who had been to the Arctic Ocean, and had penetrated farther north than any of his predecessors (although even he had failed to attain the great *desideratum*); and a foreign *prima donna* about whom every one raved. But numerous as the calls on the public attention were, Dr. and Mrs. Carewe had their fair share; and the man who had done such distinguished service in the Turko-Russian war, who had been laid at death's door by banditti in the wild hill-country of the Carpathians, who had fought so desperately for his life in the little convent on the borders of the forest, could not fail to be a remarkable personage; and on the fair Spring morning when he and Cecil were made man and wife, the church was crowded to excess, not only by the rich and titled, but by those poor people whose welfare Lawrence had made his special care, and whom he had never neglected even when his practice had become so vast and his name famous; and many a murmured blessing fell upon Cecil's ear as she left the church on her husband's arm, and her heart throbbed and her cheek glowed at the thought of how he was loved and reverenced.

The wedding tour was but a short one, for Dr. Carewe had already been absent too long, and he and his beautiful wife returned when the gay season was at its hight, to be feted and caressed, and to be present at the marriage of Ernest Eleston and pretty Lottie Tyrrell, which gave Cecil unqualified delight.

But pleasant as it may have been to be the lions of the evening, pleasanter far were the quiet hours Cecil and her husband passed together in the home, which had been made so beautiful to receive its fair young mistress; and the brightest moment in Lawrence Carewe's life is that when, his day's work over, the carriage turns homewards, and he sees his wife's face, as she stands waiting and watching for him at the window, growing bright and radiant with the joy of his return.

Mr. Daton is a very frequent and welcome guest in that house; and people say that Lester Hall has been restored to all its former beauty, and that the estate has been re-purchased by the wealthy merchant for Cecil's eldest boy, Henry Lester Carewe, who is a wonderful favorite with his great-uncle. It is said, too, that Dr. Carewe has resisted all entreaties from Mr. Daton to give up his practice and reside at Lester Hall, and Cecil agrees with his decision. Self-pleasing has never formed a great part of his existence, and he feels that he can be more useful in his day and generation—can have a wider field of influence for the good of his fellow creatures in that great city, where joy and sorrow, riches and poverty, jostle each other check by jowl; and when he sees faces brighten at this approach—when he sees pain alleviated and distress lessened by his presence—he is amply rewarded for any sacrifice he has made; although every year their holiday is spent at Lester Hall, and Cecil is very happy showing her old home to her husband, and going over with him the favorite haunts of her girlhood. Side by side too, they stand at Reginald Lester's grave, where "after life's fitful fever he sleeps well;" and they talk in hushed, tender tones of his last hours, and hope that he, and the man through whom, in a great measure he sinned, are at peace; for there is no limit to the mercy of Heaven, and for the greatest of sinners there is love and pity there, "in that beautiful, veiled world."

"Where we may, I trust, meet them both some day, Cecil love," says her husband, tenderly, as they stand in the light of the setting sun, and Cecil draws nearer to his side, and leans her head against him—a little saddened, perhaps, at the recollection of her brother, but perfectly happy and at peace in the love of her husband and children.

So we will leave them; and in the west the setting sun sheds a golden glory over them—a promise, as it were, of that beautiful world of which Lawrence speaks.

THE END.

THE EYE-OPENER.

In all large towns there is a class of sharpers ever on the outlook for country folks upon whom to prey. The "confidence game" is the means by which they usually try to "take in" the stranger and "do for him." A specimen of one of the ways in which this is worked came prominently to public notice during the week, because the "operators" were for once caught and punished. Miguel L. Thimion was about to start for Galveston, Texas, and while standing on the pier near the steamer shortly before she was to start, an elderly man of good address and respectable appearance entered into conversation with him, in course of which he said that he, too, was going by the same vessel. While they were talking, a younger man, looking like the driver of an express wagon, hurried up to the elderly man and said:—"Your baggage is aboard, sir. I'd like to have my money." The elderly man seemed much annoyed, saying that all of his ready money was in his trunks. He took out what purported to be a $1,000 bond and a check for $550 upon the Butchers' and Drovers' National Bank. He asked Mr. Thimion to lend him $50, offering the check as security until he could go to the store of a friend and get some money. Mr. Thimion gave him the money and he hurried away, followed by the expressman. Of course, he failed to return, and the check turned out to be worthless. The duped Thimion deferred his trip, contrary to the swindler's expectations, and from his description the detectives arrested two well-known "confidence men," Edward Lillie, alias Morgan, the venerable old fraud, and "Red-handed Smith," the false expressman. They got 2½ years' imprisonment each. In nine cases out of ten, however, such rascals escape, because the victim has to leave town, or for other reasons. The above is only one of 1,000 ways of "scraping acquaintances" and "plucking pigeons" practiced by these fellows, the most common of which will be noticed from time to time as specimens come up in our police courts.

The sharpers against whom the Post Office is waging war are now operating mainly through the Express Companies, so that our friends must still keep watchfully on their guard against their allurements. Here are the names of a few more of the slippery tribe.—Byron H. Robb, Cincinnati, O., alias The American and European Secret Service Co., alias The American Detective Newspaper, alias The Co-operative Commercial Co., alias The Commercial Reporter Newspaper, alias The Electro-Magnetic Brush Co., alias The Incina Co., alias The Monitor Lamp Co., alias The Monitor Publishing Co., alias The Singapore Tobacco Co, Peter W. Williams, Chicago, alias E. G. Napa & Co., Victor Napa & Co., alias The Paris Importing House, alias The Paris Book and Novelty Co., alias John Catlin & Co. Kentucky State Lottery, Covington and Louisville, Ky., and New York. R. C. Wintersmith, Louisville, Ky. J. C. Wilson, Ladonia, Texas, alias A. J. C. Wilson. Clarence W. Miller, Glens Falls, N. Y. Murray, France & Co., Louisville, Ky. W J. Hill, alias C. W. Whitney, Elkhart, Ind., Augusta, Mich., and Battle Creek, Mich. J. C. Henry & Co., alias Clarence W. Miller, Glens Falls, N. Y., and Chester, Pa. Great Western Distribution Co., alias Matthews & Co., alias Kunnecke & Co., Cheyenne, Wy. Ter. E Gustavus & Co., alias F. E. G. Lindsay, Holston, Va. Rev. James Murray, D. D., Haddonfield, N. J., alias The Livingstone University of America. H. H. Hull, alias United State Agency, Mt. Winans, Md. Chas. E. Hunt, alias Nettie W., Philadelphia, Pa. C. Wade, Elkhart, Ind., Augusta and Battle Creek, Mich., alias C. H. Walker. Henry G. Watterson, alias F. G. Watterson, Calais, Me. Giovanni Patront, Philadelphia, Pa., and Camden, N. J. J. M. Pattee, Manager, Cheyenne, Wy. Ter. Jorda & Puig, New Orleans, La. John P. Joyce, Covington, Ky. A. Henry, alias Michael & Co., Atlanta, Ga. D. A. Kratzer, Burlington, Ia. C. W. Whitney & Co., Glens Falls, N. Y., and Chester, Pa. Philadelphia Stamp Co., Philadelphia, Pa., and Camden, N. J. John W. Magee, Laramie City, Wy. Ter. Wilcox & Co., Windsor, O. George R. Smith, Covington, Ky. Jace Marks, La Crosse, Wis. How true it is that no part of the country is without rascals, though, it is true, this sort of rascality seems to flourish with special rankness in large cities, and a few small hot-beds here and there in rural regions. By the way, a Dr. Brown, who styles himself a "veterinarian," is fleecing the villagers out West thusly:—Like many another charlatan, he enters a town in a painted wagon, makes arrangements for a course of lectures on veterinary subjects, collects the tuition fees, and "clears out." Michigan folks have been his latest victims of whom we have heard, though there may be later ones. In Decatur he gathered up $70; in Dowagiac, $80; Pokagon, $100; Niles, $90, and considerable in other places. The fellow may change his name in other places, and give a new coat of paint to his wagon—he deserves a coat of tar himself, and perchance may get it.

NEW PUBLICATIONS.

Sunlight and Shadow: or, Gleanings from My Life Work. By JOHN B GOUGH. Hartford, Conn.: A. D. Worthington & Co., publishers. Price $3.25, $4.00 and $5.00.

"Sunlight and Shadow" is a remarkable book by a remarkable man, who through all these years of varied experience has been a keen and careful observer of men and things. The recollections of his own bitter experience have made him ever ready to lend a helping hand to others, and the very nature of his life-work has brought him into close contact with poverty, crime, destitution and vice. His ready sympathy has gained for him access to the hearts of the most degraded, and he has listened to life-histories of the most thrilling nature, and witnessed scenes that testified anew to the truth of the adage, "Fact is stranger than fiction."

This book is not altogether a record of dark experiences. It has a bright and sunny side. Mr. Gough's stories and descriptions of the humorous side of life, as he has seen and experienced it, portray many amusing scenes. His remarkable faculty for seeing the ludicrous side of everything, and his talent for humorous description, are well known. No one can tell more amusing things and in a more irresistably humorous way than John B. Gough. The comedies from life, absurd blunders, laughable mistakes, comical incidents, embarrassing situations, mostly drawn from his own experience on the platform and among the people, as told in "Sunlight and Shadow," will provoke the mirth of the most serious.

He also gives the reader his personal opinions upon many of the most important questions of the day, coupling the sharpest censure of everything weak and wicked, with a hearty and generous praise of everything good and true.

The paper, printing, binding and illustrations are excellent. The steel-plate portrait of Mr. Gough will be highly prized by tens of thousands in all sections of our country who have listened to the eloquence and who admire the genius of this famous man.

My Wayward Pardner. By Josiah Allen's Wife, Hartford, Conn.: Published by American Publishing Company.

To those familiar with this author's writings, the nature of this book will suggest itself. To others we recommend a perusal if the taste runs in the humorous line.

The theme, to use the author's own words is "Winnen and Josiah," Josiah being the wayward pardner. The subjects are "Josiah Allen Goes Astray, Kitty Smith and Caleb Cobb, Josiah Goes Into Business, Moralism and Episodin', Josiah Undertakes more Business, A Visit from Miss Rickerson, Cassandra's Tea Party, The Lords of Creation, A Exertion for Pleasure, A Visit to the Children, Tirzah Ann to a Watering Place, Miss Bobbett Lets the Cat Out, A Serenadin' Episode, Etc., Ju'ia Wart and Sufferin' Women, A Crisis with Ke up.

In point of amusement from beginning to end the object is gained. The characters are clearly drawn and treated of with an easy flow of language.

Drifting Round the World. A Boy's Adventures by Sea and Land By Capt. C. W. Hall, Boston: Lee and Shephard, Publishers.

Nothing better can be said for this interesting book, than to quote a portion of the preface. "So many books have been written upon the usual routes of European and Asiatic travel that it is difficult now to excite the interest of young readers without going out of the beaten track. The adventures related in this volume are novel and picturesque, and they follow a comparatively new course. The hero, Rob Randall, ships on board the "Racer" a Cape Ann schooner, bound to the coast of Greenland for halibut. He visits Iceland, and beholds its grand and desolate scenery, its famous geysers and its simple inhabitants. Many other countries are passed through, and in the description of the long journey, devious and broken by various accidents, the reader is introduced to new and striking scenery, and to people little known and seldom described in modern literature. The book has nearly two hundred illustrations, which place the scenes vividly before the youthful reader. The author has aimed to supply knowledge, as well as to minister to the pleasures of the imagination."

The Anthem Harp.—By W. O. PERKINS. Published by O. Ditson & Co. Boston, Mass.

The Anthem Harp is a book of ordinary church music book size, and seems to contain an excellent variety of "Opening Pieces," or Anthems, for the use of common choirs. It is designed to be a successor to "Perkins' Anthem Book," by the same author. As the former book was very popular, we may confidently predict good success for a new one on the same plan.

One is pleased to see old "Jerusalem" revived from its long sleep, and provided with first-rate new music. "Savior, breathe an evening blessing," and a few other choice hymns, are preserved, but most of the words, as they always must be, are from the Scriptures.

Catalogue of Books. Published by Houghton, Mifflin & Co., Boston, Mass.

This catalogue contains much valuable information and is alphabetically arranged by author's names, and by titles of books anonymously. The index gives the names of both authors and books and classifies nearly all works. It is sent free upon application as above.

Wild Roses of Cape Ann and other Poems. Boston, Houghton, Mifflin & Co.

The very pretty collection of poems, mentioned above, is from the pen of the well-known authoress, Lucy Larcom. The poems, with the exception of the "Flowers of Cape Ann," are all brief, and the topics treated are of wide variety. It is a book which will be penned with pleasure, and its appearance at the holiday season was opportune.

For Women.

CONDUCTED BY MISS RAY CLARK.

A QUAKER SERMON.

It was the first-day meeting,
And the group of gathered folk
Sat touched by the hush of a voiceless spell;
No sound the silence broke,

Until in her place on the woman's side,
With a sweet and tender face
That bore the pure and peaceful sign
Of the inward spirit's grace,

A white-haired woman rose with the word
That was laid on her heart to say—
The word that the gathered people
Were awaiting that sunny day.

"Sister Tabitha all to pieces
My best china teapot broke;
But I kept my soul in patience
Nor a word of anger spoke."

That was all: and down with the sunshine,
The silence again fell sweet,
Till the elder people gave the sign
That the service was complete.

Do you say that the hour was wasted!
That the sermon was trivial, vain,
Textless, devoid of logic,
Unthrilled by one eloquent strain?

Not so; for that gospel is sweetest
That is won through life's fret and its pain,
That softens the jar of its friction,
And lightens the stress of its strain,

And the love that is over the erring,
The peace untouched by surprise,
The quiet that keeps its sweet patience,
Are dear in the Master's eyes.

While many a rhetorician
Might learn from this homily brief,
A truth that the wearied people
Would hail as a glad relief—

That the lesson is most enduring
Close to life's practical lines,
And not the length, but the fitness
The heart of the hearer inclines.

And we all in our plain home duties
Find the thoughts in this first-day word,
That the least of our trials and triumphs
Has a worth in the sight of our Lord.

HEALTHFUL UNDER-CLOTHING.

MARY E. BURROUGHS.

THE last decade has witnessed a great revolution in woman's dress, not so much in outward appearance as in comfort and healthfulness. The old-time fashion of suspending all garments from the hips so that every woman looked like an hour-glass, is fast passing away. The idea of individuality in figure is essentially a modern one; only the modern woman has the courage to preserve her natural figure and adapt her dress to it so as to bring out the best features. The reluctance with which women are accepting the reformed style of under-clothing, is due to several causes. Many clung to the notion that a tiny waist, sloping shoulders and broad hips, are the chief characteristics of a beautiful figure. Many are too ignorant to know how fatally injurious to health their clothing is, and many find the reformed underclothing so complicated with tapes, straps and buttons, that it is almost impossible to remodel their old-style clothing into the new, or if remodelled it is too troublesome to wear and to take care of.

Like every American invention, it has been continually improved; the knowledge of physiology and hygiene which has of late years become an essential part of a good education, particularly of woman's education, has dissipated and modified the first two objections and the last, has been removed by the reformers themselves. At last we have a style of under-clothing, at once pretty, comfortable, simple and healthful. To many women who would be willing and glad to reform their style of clothing, the "how" is the difficult question, and an almost insurmountable one. For the benefit of such we propose to describe a complete suit of under-clothing which we know, practically combines all the characteristics which we have mentioned.

For winter under-clothing, the suit next the skin may be made of white canton flannel, cut reform style; that is, all in one length, including the legs, high at the neck, gored, and with darts fitting to the figure like a basque. It is buttoned down the front about six inches below the waist and there are two large buttons on the back for the necessary opening. The legs should be made to come down to the shoe-tops and should be left open six inches up, so that they can be lapped over and the stocking drawn over them. It is best to have the stocking long enough to come comfortably over the knee. Shoulder suspenders of which a great variety can be found in the stores, are very good for holding them up, but a better contrivance is a short piece of rubber elastic with snaps on each end such as are used by gentlemen to hold up their sleeves, which may be snapped into the stocking, and then into the under-clothing a little higher up. Over all there should be a suit of colored flannel cut precisely like the undersuit and ornamented as much or as little as one's taste requires. With these two suits only one light flannel skirt is needed which should have sewed to the band, a couple of wide tapes passing over the shoulder with a cross piece of tape to keep them from slipping off. Thus, there is no weight upon the hips and the figure is improved because every garment fits precisely like the dress.

Slender women adopting this clothing can do without corsets without detriment to the appearance of their figures, while those who still think they must wear corsets will find a great improvement in the fit of their clothing and some relief from the weight of it. For Spring and Fall, muslin suits made in the same way, can be worn over the white flannel suits and in Summer worn alone. Of the colored suits only two are positively necessary, since they do not require washing so often as the white. Those who do not care to take the trouble of making the white undersuits, can buy very nice ones, woven in the same style; but the heavier colored flannel ones cannot be boughten.

VANITY FAIR PAPERS.—No. 2.

Window Furnishings—Scrym—Cretonnes—Inexpensive Screens—A Misplaced Puppy—Grid-iron Decoration.

No one feature of a room exercises a greater influence on it than the window-hangings, and yet it is only within the last three or four years that women have attempted to arrange this class of draperies with an eye to *artistic* effects. We have had window "fixings," such as they were, but how utterly devoid of taste have they been in most instances. Who of us does not remember the dark shades of other days? A dreary expanse of brown or gray, unrelieved by a spot of color, was presented to the room; whatever there was of ornamentation being made to face the street. Then followed the era of whiteness. White shades, white paint, white curtains, white cord and tassels, a dead, uncompromising monotony of white. Not even a half-tint was permitted to impart the faintest tinge of color. Probably nothing more trying to the complexion than colorless hangings at the window could be devised.

However, unadulterated whiteness has had its day; the lady of the period, whether of high or low degree, decorates her windows with color. Sometimes only with touches of it here and there, and again it is made to sweep in graceful folds from ceiling to floor.

A little money judiciously expended will modernize the most old-fashioned of windows. If the shade is of white linen it can be dyed cardinal, "æsthetic" red or crimson. If for any reason it is not desirable to color the shade, a band of embroidery in bright-colored crewels, placed within three or four inches of the lower edge, will make a charming finish. Dark shades are to be avoided.

Curtains of Swiss, tied back with gay tinted ribbons, add much to the attractive appearance of a room. Scrym, a comparatively new fabric, is extensively used for window-hangings. It is uniform in width, but varies in price from 40 cents to $1 per yard. The higher priced grades come with bands of insertion, but the quality sold at 50 cents can be made to look very rich by the addition of squares and edgings of antique lace. Embroidery shows to excellent advantage on scrym. A design of wild roses and forget-me-nots, worked in natural colors, looks exquisitely on curtains of this material. The design is placed across the top and bottom and the whole length of the inner side of the curtain.

Cretonnes are shown this season, not only in the bright colors and designs to which we have been accustomed, but, in addition to these, manufacturers have attempted Oriental effects and with excellent results. When hung these cretonnes resemble heavy woolen fabrics very closely. Trimmed with insertions and edgings of antique they are beautiful and expensive looking.

I do not mean to exhaust the subject of curtain materials now, but hope in a future article to have something to say on the subject of momie cloths, felt, canton flannel, raw silk for window curtains and portierres.

A word or two in praise of cretonne will not come amiss, perhaps. It is now presented in such a variety of exquisite tints and beautiful designs that one is tempted to embalm all the household furniture in cretonne. A few yards of it will make a dingy room blossom into a bower of beauty. Hung at the windows, used as table spreads or bureau covers, it can be made to do excellent decorative service. It also makes a good screen covering. By the way, the rich should not be allowed to monopolize that most useful of articles—a screen. Draughts from windows and doors can be warded off by means of it, and with its friendly aid one can improvise a retiring nook. In many ways it can be made serviceable in a home. It need not be a costly piece of furniture. Ebony frames with hand-pointed silken hangings can be left to the wealthy, but the poorest among us can get a frame of some sort and cover it with a half-worn dress. A common clothes-horse, covered with pretty calico or cretonne, makes an acceptable addition to the furniture of a bed-chamber or the family living room.

In these days it is imperative that one should be decoratively inclined. Societies devoted exclusively to the advancement of the decorative mania are springing up all over the country, and our homes fairly teem with creations in worsted, felt and satin, born of our devotion to "art." It is to be expected that eccentricities of taste should come to the surface, and they do—that most prosaic of domestic utensils, the smoothing-iron, is transplanted from its native sphere of usefulness. Brought to my lady's chamber, it is turned on end, decorated with some dainty design, and we are expected to consider this nondescript affair in the light of an artistic ornament.

A gentleman I know of, who has lately taken to possessing himself of old bits of furniture, until it seems likely that his modest little dwelling will present the appearance of an auction shop, has adorned his office with a fifty-year-old gridiron! At present writing it is in a nude condition, but doubtless before long some artistic lady will line it and hang it with tassels, or perhaps gay ribbons will be twined about its ribs, and another decorative monstrosity will be ushered into existence.

Through the parted curtains of satin which adorn the windows of a handsome house in this city the passer-by sees a richly-carved ebony stand, on which rests a china dog of the English bull-pup type. Satin, ebony, and a $5.00 china dog! When the art-shops display such quantities of exquisite bric-a-brac of all kinds; when statues and statuettes can be bought for such comparatively small sums, what must one think of the taste which selects a miserable caricature in china as a window ornament? FAITH RIPLEY.

ABOUT WOMEN.

MRS. JOHN JACOB ASTOR has sent a font with basin of solid silver to the mission chapel which she has established in Nebraska.

OWING to the death of the Duchess of Westminster, aunt of the Marquis of Lorne, no entertainments will be given at Rideau Hall until after the new year begins.

MRS. CHARLES Stewart Smith has given $3,000 to endow a life-bed in the Hahnemann Hospital in memory of her parents, John Caswell and Mary Caswell.

CORRESPONDENTS' CORNERS.

WHAT is Grace Greenwood's real name; how old is she at present, and at what age did she marry? Answers to the above will be kindly received by a constant reader of the RURAL. MRS. S. L. W.

ANS.—"Grace Greenwood" is Mrs. Leander K. Lippincott. She was born at Pompey, Onon. Co., New York, Sept. 23, 1823, and was married in 1853.

Mothers with sickly, fretful, nursing children, will cure the child and benefit themselves by taking Hop Bitters daily.

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

THOSE CARELESS BOYS.

O. W. DAY.

MARY WAGER-FISHER has won my gratitude. She has voiced, or rather penned, the trials of my life for years in her article entitled "Concerning Careless people." I thought my case was an exceptionally severe one, and it has lightened the burden to know that some other person has a like experience. I called the attention of two male members of my family to the article in question. Each read it. One of them good-naturedly went up-stairs, and in a quiet manner put a few of his scattered belongings to rights. There is hope of him! The other did not feel "hit," and when I mildly pointed to two or three articles he owned, in places where they ought not to be, he argued the matter, trying to convince me they were "all right," were handy, etc., etc. I sighed audibly and gave it up. It has been "line upon line and precept upon precept" with that incorrigible youngster since he was old enough to "sense it." I wrote out rules in very plain letters concerning his bureau and closet arrangements, and tacked them up in his room. They were entitled—very appropriately—"How to Keep Peace in the Family." He read and heeded—*one day*. He lost, successively, his "Sunday hat," his sealskin cap and his every-day hat, and actually had to wear a hood to the barn, when he did the chores. They all turned up, however. His sisters don't like to wait on him, naturally, and they play tricks with his misplaced garments. He finds his hair brushes in the middle of the bed: his hat gets flour on it, and his shoes are wet inside. Lately every article belonging to any member of the family found out of its place, is placed in his or her chair at the table. This morning the contents of the several chairs were as follows:—"That Boy's" chair held his overcoat, his best hat, a pair of mittens and a flageolet. The head of the family's chair contained a pair of shoes; the other male member's a hat and cane. (Those boys keep a sharp lookout for our shortcomings. To-night I sat down on my knitting work). I shall persevere, in hopes my persistence may mend, if not cure matters, and on reading this, some other worried housekeeper may see that she has a common grievance. A boy should be made to clean his boots well, in order to save the newly-washed kitchen floor; to put the paper, folded, in the paper holder when he is done with it; to put away pens, ink and paper when through writing; to put his chair in place when he goes to bed, and many other things that may lighten mother's burden of care. I know a man who, in hiring an office boy (his office was connected with a sitting and bed-room), always set the applicant for the position to making his bed. If the result satisfied him he took the boy into his service. He argued if the boy had not been taught to make beds he had slept in before that if he had observation sufficient to accomplish the details required in the process of bed-making, he was a "handy" boy that would soon learn to be useful and trustworthy.

INSECTS IN BEDS.

MARY WAGER-FISHER'S article on "Beds and Bedding" reminds me of my own experience when I first went to housekeeping. The housekeeper who presided over these bachelor quarters considered the dairy *her* province, and the servants under her charge considered doing as little work as possible *their* province, and in spite of new paint and paper, I was disgusted to find insects in the up-stairs bedsteads. Though young and inexperienced, I was persevering, and ordered the offending furniture to be let down from the windows, not allowing it to pass through the house. Then, after a good washing, the parts were well soaked with coal oil and left out-of-doors for a week, at the end of which time the treatment was repeated. During the 16 years since that time I have never seen a vestige of the pests, and consider coal oil a thorough remedy if persevered in ANNIE L. JACK.

DOMESTIC RECIPES.

Bread Pudding.

One quart of milk, three cups of fine, dry bread crumbs, three eggs, a teacupful of sugar, two tablespoonfuls of butter, lemon peel or extract. Soak the crumbs in the milk, stir in the beaten yelks, butter and sugar. Add the lemon last. Cover and bake a half hour, then beat the whites stiff, add a little sugar, spread over the pudding and return to the oven until a delicate brown.

Fried Potatoes.

Cut into dice cold boiled potatoes and fry in two spoonfuls or more of good beef drippings. Salt, and when the mass is well browned, serve.

Corn Fritters.

Drain the liquid from a can of corn and chop the grains fine. With this mix two beaten eggs, a cup of milk, salt and pepper and two tablespoonfuls of flour with a half teaspoonful of baking powder mixed with it. Beat thoroughly and fry by the spoonful on a greased griddle. M. B.

To Dry Figs.

The fruit should be gathered when it begins to crack. Make a strong lye, dip the fruit into the hot liquor and at once take out. (A wire basket is good for this purpose.) Expose to the air for a few minutes and dip again. Place upon trays and expose to the sun for a few days, putting them under shelter at night. Pack in small wooden boxes. L. B.

No good health with thin, impure blood. Hop Bitters makes rich blood, good health and strength.

THE
Rural New Yorker's
REMARKABLE
CLUBBING COMBINATIONS,
For 1880-81.

Read Them.

Six of the most Enterprising Journals in the country Club with the Rural for nearly the price of one.

**The Inter-Ocean,
Globe Democrat,
Detroit Free Press,
New York World,
Pioneer Press,
N. Y. Evening Post.**

The Greatest amount of Reading Matter and the Lowest Prices of any Clubbing Combination heretofore offered.

The Rural Home fully supplied—The News of the World—the most trustworthy Agricultural and Horticultural Information—Seeds, Plants—All for about the price of one good paper.

THE WEEKLY INTER-OCEAN (Chicago, Ill.) has no superior as a first-class secular and political newspaper. It is a large, eight-page journal, with seven columns to the page, price $1.15. It will be sent one year with the RURAL NEW-YORKER, and the RURAL'S seed and plant distribution, for only $2.75.

THE WEEKLY DETROIT FREE PRESS (Detroit, Mich.), one of the most popular weeklies in the United States, combining wit and humor with the best literary and secular matter; Also the "Household," a bright and sympathetic paper for the home circle, will be sent one year with the RURAL NEW-YORKER and the RURAL'S free seed and plant distribution for only $3.50.

THE WEEKLY NEW YORK WORLD (New York), a live, enterprising and ably-edited newspaper, full of the latest political, secular and literary news of the day, price $1.00, will be sent with the RURAL NEW-YORKER one year, and the RURAL'S seed and plant distribution, for only $2.75.

Specimen copies of any of the journals here announced as clubbing with the RURAL NEW-YORKER *will be sent without charge to all who apply. The application, however, must be made to the journal of which specimen copies are desired. Send for them!*

Thousands die annually from some form of kidney disease that might have been prevented by a timely use of Hop Bitters.

News of the Week.

HOME NEWS.

MONDAY, Jan. 24, 1881.

THE Standard Oil Co.'s works at Point Breeze, Pa., were consumed by fire on the night of the 17th. The scene of the fire is the same as that of the disastrous fire of 1879, which entailed a total loss of $500,000. The origin of the fire is unknown, though it is supposed that in filling the tanks from the still, the oil became heated in some way, and, coming in contact with the gas in the tank, caused the explosion. The entire loss will reach $150,000.....George Lawrence, a farm hand, living nine miles from Springfield, Ill., was given a diseased pig by his employer, Mr. Simpson After keeping it several weeks Lawrence killed it, and himself and family ate of it. His wife became sick, her limbs swelled and burst and mortification set in, causing death. Mr. Lawrence is lying at the point of death, his body and limbs being swollen to twice their usual size, and having a whitish appearance and as hard as marble. The children ate but little of the pork and have not suffered severely. Portions of the meat have been analyzed and show it to be alive with trichinæ.

The Whittaker court martial organized on the 20th inst. in this city and then adjourned until Feb. 1, in order to allow the counsel time to prepare the case.....A new narrow-gauge road is to be constructed from Steubenville, Ohio, to Carrolton, there connecting with roads of northern Ohio.....Prof. Wm. C. Fowler, son-in-law of Noah Webster and editor of the university edition of Webster's dictionary, died at Durham, Conn., on the 15th inst., aged 87.....Mr. E. White, who has been for many years prominently identified with the Eastman Business College of Poughkeepsie, N. Y., has been elected Mayor of that city. We congratulate our friend White, and also the City of Poughkeepsie, upon the wise choice they have made.....It is now proposed to have a committee of three appointed to consider the charges respecting the Halifax fishing award, the committee to consist of one person from the United States, one from Great Britain, and the third to to be selected by both nations.

The coal companies of Pennsylvania have under consideration the question of resuming work at the mines on full time, but no understanding has been reached. All the companies, with one exception, have agreed to this proposition, but it has been determined to take no action on the programme for February until the latter part of this month.....Joseph Diroch, who shot and killed Thomas H. Trelvar a few days ago on account of a difficulty concerning Trelvar's wife, was captured six miles from Bodie, Cal., on the 17th. He had a preliminary examination which established his guilt, and about one o'clock the next morning he was taken from jail and taken to the scene of his crime and hanged. Five hundred men witnessed the execution.....Peter Pitchlynn, delegate of the Choctaw Indians, died on the 17th inst., aged 75. He had been in conference with every President since Andrew Jackson, with business pertaining to his people.....Capt. Eads will ask Congress to aid in the construction of his proposed ship canal by guaranteeing six per cent. dividends on the $50,000,000 of stock which he will issue, and he expresses the utmost confidence that his petition will be granted.

Newport, R. I., has voted by a large majority, to cede Coasters' Harbor Island for a site for a United States naval training school.....There were 1,000 disasters on the great lakes last year, involving the loss of more lives than for several years past.....The Chicago ice companies will gather 1,500,000 tons of ice this season, 75 per cent. more than last year..... .The stock of flour in California January 1 was 78,000 barrels; wheat, 19,895,000 centals; barley, 1,652,000 centals.....The Finance Committee of the United States International Commission adopted by-laws and appointed sub-committees Tuesday. William L. Strong and Thomas Barbour have subscribed $10,000 each to the fair fund .....The sun shining on a brass sign has led to litigation between two Philadelphia shop-keepers, in which the party suing claims $5,000 damages. Henry D. Plung is the claimant and Partridge & Richardson, of No. 17 North Eighth Street the defendants. In an affidavit filed recently Plung declares that in May last a small metallic sign was placed below one of the windows of No. 17 North Eighth Street, and that at certain times in the day the sun's rays were reflected by means of the polished surface of the sign, and the rays so reflected passed through plaintiff's window, greatly to the annoyance of his customers, and deprived him of the gains and profits which he could have made had the light not shone on his goods. This is the foundation of his suit.

The Oriental Tea Company, of Chicago, made an assignment on the 17th. Their liabilities are estimated at $40,000, and their assets at $14,000 ..... The Rochester, N. Y., branch of the Irish Land League has passed a resolution protesting against the persecution of the Jews in Germany.....At the annual meeting of the Boston Marine Insurance Company, on the 17th, it was voted to increase the capital of the company from $500,000 to $1,000,000.....The Chicago City Council has passed an ordinance permitting the South Side Street Railway to use an endless cable under ground for motive power for cars. The cost of the cable will be over $2,000,000.

Prof. E. S. Holden, of the Naval Observatory at Washington, has accepted the managership of the Washburn Observatory in Madison, Wis., the position made vacant by the recent death of Prof. Watson. Prof. Holden will enter upon his duties in a few weeks.....The new Albany Capitol Commissioners' report, transmitted to the Legislature Tuesday, gives the following financial exhibit:—Expenditure for the year ending December 31, 1880, on contracts and for material and labor, $1,299,197.84. Expenditures for the new Capitol from commencement to December 31, 1850, for lands, $628,447.62; for interest, $56,935.04; construction expenses, $10,914,516.40.

The obelisk was successfully raised to its foundation at noon on Saturday, Jan. 22.....Mr. E. A. Sothern, the celebrated actor, is dead. He was born in Liverpool, April 1st, 1830, and at the age of 22 he made his first appearance in this country at the old National Theater, Boston, as Peter Pangloss, LL.D. and A. S. S., in the "Heir at Law." His name is inseparably connected with the comedy "Our American Cousin," in which he appeared as "Lord Dundreary." His last appearance in New York was in November, 1879.....The first annual banquet of the Press Club of Chicago, at the Palmer House, was one of the most successful affairs of the kind ever given. Covers were laid for 160 members, guests and ladies, and after the menu had been disposed of, addresses were made by many of the lights in journalism and kindred professions.....A singular and shocking murder was committed recently at Lapeer, Mich. While the people were at church Mrs. Barnard, wife of a prominent lumberman at Greenville, went to the residence of the Rev. E. Curtis, attacked his wife, threw her down, poured gasoline over her clothing and set her on fire. The unfortunate lady was terribly burned, and died within a few hours. As there was no apparant motive for the crime, it is believed the murderess is insane.....A Masonic lodge at Fredericksburg, Va., being the one in which George Washington was initiated in 1752, has determined to build a Washington memorial Masonic temple. The Grand Lodge of Virginia will assist.....Outside of the California delegation the general sentiment in Congress is favorable to the Chinese treaties under which it is thought that the United States will reap substantial advantages. It is understood that they will be ratified.

P. A. Goddard, county auditor elect of Wabasha county, Minn., committed suicide while temporarily insane.....In Chicago three new cases of dangerous sickness from trichinæ have been discovered. A man, aged 70, will probably die.... .. The Boston and Albany Railroad has for several weeks been selling one thousand mile tickets at the rate of one cent a mile. The Fitchburg Railroad has just adopted the same policy. This, in both instances, is a substantial reduction to habitual patrons of the roads, and is probably, as it has been in other cases, a step toward a permanent reduction of regular rates.....In Chicago, Timothy Cooper, colored, has obtained a verdict of $2,000 against the People's Omnibus and Baggage company. Cooper was ejected from an omnibus by the driver because he was colored..... Judge Bond, of the U.S. Circuit Court, at Baltimore, refused to grant an injunction in the suit of the Pullman Palace Car Company against the B. & O. railroad for infringement of patent in using the Pullman sleepers on that road.....Bruno Hillage was brutally murdered by Juane Ray near San Antonio, Texas, Monday. Hillage had refused Ray the use of his team and was shot and then chopped to pieces with an axe as a result.. .... The buildings owned by J. O. Proctor and Mr. Ferris, of Brighton, Ontario, were destroyed by fire recently. Loss about $18,000; insurance; $9,000.

[Galveston News.]

The Madison, (Wis.) Democrat, in endeavoring to treat the wounds received by the candidates for the presidency, wisely prescribes St. Jacobs Oil. Of course we could not expect our worthy contemporary to do otherwise than recommend that famous Old German Remedy,—which "heals all wounds but those of love" and soothes all pains,—save those of political disappointment.

FOREIGN NEWS.

Last Saturday the news reached here that Lima, Peru, had been captured by the Chilians, and today comes the intelligence that Callao, a strongly fortified town of about 30,000 inhabitants, the seaport of Lima, from which it is six miles distant, has also been taken. The cause and course of the war are briefly sketched editorially, so that here it is necessary to say only that the Province of Atacama, about which the war arose, was considered a worthless desert of extreme barrenness until a few years ago, when a large area of niter beds was discovered in it, making it at once an object of desire by Bolivia and Chili, the latter of which claimed the southern part of it, which turned out much poorer than the northern. At the capture of Lima the Chilian army numbered about 40,000 men, chiefly veterans, and the Peruvians about 50,000, mostly recruits.....

The English government is still making numerous arrests of Land Leaguers on the ground of intimidating those who are not members of the League. Very slight causes suffice to justify an arrest. Miss Gardiner, of Ballina, County Mayo, is the last prominent landlord—landlady?—Boycotted. She is represented as an amazon of an "old maid," very abusive, harsh, exacting and tyrannical to her tenants and disagreeable to her neighbors The Grand Orange Lodge of Ireland has sent a band of men to her relief, and these will be guarded in their turn by a detachment of "horse, foot and artillery." The coercive bill that will be brought before Parliament "for the protection of property" in the distracted island will empower the Viceroy, with the advice of the Irish Privy Council, to declare the districts in which the act is to be enforced, and a subsequent clause will suspend the habeas corpus by empowering the Viceroy, upon reasonable suspicion, to arrest any person deemed an offender within the terms of the act. It will also provide that persons so arrested cannot be released, tried or bailed without an order of the Privy Council or the Viceroy. Another clause will in certain cases substitute trial before two judges for trial by jury. It is possible that the suspension of the habeas corpus will continue until the 1st of August. The trial of Parnell and his followers is still in progress.

The severest storm that has visited England for 20 years ravaged the country last week, causing a loss of $10,000,000 in London alone, owing to an unexampled rise of the Thames, which flooded all the low-lying districts on both banks. ....Immense damage has also been done throughout the whole of the United Kingdom. The loss to the farmers is extremely heavy. The storm also swept over most of the Continent causing woeful loss and havoc. In the Spanish Peninsula the hurricane is reported to have destroyed half the crops of oranges and lemons, besides doing an enormous amount of other damage. The loss to agriculture is put down at $40,000,000. In the Mediterranean the gale was extraordinarily violent, and of course so it was in the Bay of Biscay, which has a goodly share of all the bad weather of Western Europe. Shipwrecks are said to have been very numerous and disastrous.

[St. Louis Republican.]

It is very rare that the Republican consents to editorially forward the interests of advertisers of what are known as patent medicines, as it does not frequently fall out that we can have positive knowledge of their merits. However, we take pleasure in saying of St. Jacobs Oil from individual experiment, that it is a most excellent remedial agent, and as such we can heartily recommend it.

AGRICULTURAL NEWS.

A review of the cotton crop and its movement, just issued by the Bradstreet agency, estimates the number of acres planted in cotton this season at 16,500,000. This is an increase of 3,000,000 over last year. Since November the weather has been very unfavorable. In Texas, Alabama, Mississippi, Louisiana, Arkansas and Tennessee rains, snow, sleet and very cold weather have retarded picking and caused great loss. On the low grounds the fields have been submerged, and the crop is still unpicked. The indications point to a crop distributed as follows:

	Bales.		Bales.
N. Carolina and Va.	417,000	Louisiana	630,000
South Carolina	425,000	Texas	1,125,000
Georgia	800,000	Arkansas	387,000
Florida	55,000	Tennessee	688,009
Alabama	660,000		
Mississippi	700,000	Total crop	5,887,009

Adding 50,000 bales not sent from plantations till after the beginning of the present crop year, the total receipts for the season will be 5,937,000 bales. The crop of 1877-8 was 4,774,000, that of 1878-9 5,074,000 bales, that of 1879-80 5,761,252 bales. The statement shows, as compared with the first four months of last season, an increase in receipts at Gulf ports of 47,367 bales, an increase at South Atlantic ports of 341,585 bales, a decrease at North Atlantic ports of 76,935 bales, an increase at all ports of 312,017 bales, a decrease in the overland shipments of 56,105 bales, and a net increase of cotton in sight of 255,912 bales. A large increase in acreage is predicted.

A short time ago Dr Lyman, the veterinarian who had been commissioned by the government to investigate pleuro-pneumonia among American cattle, landed at Liverpool, reported to the President that most of the cases occurred among Western cattle that had passed over routes along which no disease existed in the Middle or Eastern States, and therefore that pleuro-pneumonia must already be prevalent among the herds of the West. Up to the date of this report the opinion was general that the disease had not extended westward beyond the Atlantic States, and Dr. Lyman's statement was received with incredulity in most quarters. Professor Law, of Cornell University, probably the best authority on the subject in the country, emphatically denies the Doctor's statement, and maintains that not a single case of pleuro-pneumonia has come from the West either to the East or to Europe. When such authorities disagree who shall decide the question?

The exports of horned cattle from Canada to Great Britain in 1879 numbered 23,273, valued at $1,767,801; in 1880 they numbered 32,800, value $2,292,150. Sheep in 1879 numbered 54,721, value $325,099; in 1880 they numbered 110,143, value $629,062.....Export steers have been very scarce in Toronto recently, and could only be obtained by picking one or two out of a load.....A farmer at Clintonville, Ky., has a Short-horn cow which is prolific indeed. She produced triplet calves last year and twins this year—five calves in eighteen months and five days.....Sixteen car-loads of calves and yearlings have been shipped from Canisteo, N. Y., the present season to points west of the Mississippi River, to be there grown and fattened and finally returned to the New York market.....Cattle-skinners are at work near San San Antonio, Texas. They kill cattle belonging to others, steal the hides, and leave the carcasses to decay.....The Wool Growers' Convention that met at Washington on January 15, resolved that the General Government should own a farm for breeding the best varieties of stock, to be distributed among farmers as seeds are now.

Negotiations are in progress for the purchase of land in Eastern North Carolina whereupon to settle a colony of Swedes who are expected to arrive at New York early in the Spring. The location is near the Pamlico river in Beaufort county.....The annual meeting of the Pennsylvania State Dairymen's association will be held at Meadville, January 26 and 27,.. ....The Agricultural Department estimates the tobacco crop of the entire country to be 342,972,777 pounds, against 391,278,350 pounds in 1879. The seed-leaf growing States from Massachusetts to Pennsylvania have increased their acreage 14 to 15 per cent over that of 1879, the average yield for all being about the same, while Pennsylvania, the most important of these as a grower of seed-leaf, reports 18 per cent increase in acreage, with an average falling off in yield of about 150 pounds per acre, making her crop about 31,000,000 pounds, against, say 29,600,000 in 1879... ....Durham, N. C., expects to handle 18,000,000 pounds of this year's tobacco crop.

The eighth annual meeting of the New York State Grange takes place at Utica to-morrow, Wednesday and Thursday. Bagg's Hotel will be head-quarters.....The Illinois State Tile-Makers' Association began its annual meeting at Springfield on January 18th, with a respectable attendance in point of numbers. The evening session was spent in hearing a paper upon "Road Drainage," by C. G. Elliott, of Tonica, Ill., who strongly advocated the use of tile as the only means of solving the road problem in Illinois. A number of members of the Association gave in their testimony as to its thorough efficiency where tile had been used for road purposes.

The N. J. State Horticultural Society will hold its Sixth Annual Meeting at the Board of Trade Rooms, Newark, on Thursday and Friday, February 10th and 11th. Instructive addresses will be read by Dr. F. M. Hexamer, J. T. Lovett, J. A. Hale, C. W. Idell, G. W. Campbell and others. E. Williams, Secretary, Montclair, N. J.....According to the New South Wales Agricultural Grazier of October 30, there was then in Melbourne a pig which weighed nearly 1,400 pounds live weight, whilst in mere store order, and "rather out of flesh than otherwise." The animal measured nearly nine feet from snout to tail, and stood over four feet in hight.

The Mark Lane Express of January 11th, says "The lower temperature, with the protection afforded by the snow, benefits the growing crops. The dry frost favors thrashing. The deliveries of bread stuffs were greatly improved in quality and quantity, and consequently trade was little changed during the week. The demand was slow, and an attempt to raise prices failed. In London prices were maintained, but trade throughout was dull and limited. Other descriptions of British grain exceptionally quiet. Foreign breadstuffs were dull and quiet. Off coast hung on hand till Saturday when there was a better inquiry. Cargoes were slow and weak, but rather firmer at the close. Spot demand was a little improved but rates unchanged. Business has been of the quietest. Foreign flour was unchanged. The expected supplies from America and Russia largely exceed the consumptive demand. Rates, therefore, are likely to decline.

A FINE SHOWING. The thirty-fourth semi-annual statement of the Travelers' Insurance Company, of Hartford, Conn., speaks well for the successful management of that excellent institution. With a paid-up capital of $600,000, its gross assets amounted, on January 1, to $5,519,194.23, while its liabilities were only $4,051,592.72, leaving to its credit a balance of $1,467,601.51. Thus it is seen that after deducting the paid-up capital and all its liabilities, it still has a net surplus of $867,601,51. In insuring one's life nowadays, the doubt whether the company will be able to pay the amount insured when it falls due, is often a source of no small anxiety, from which those are free who deal with a company so prosperous and well-managed as this appears to be.

For the delicate and complicated difficulties peculiar to the female constitution, LYDIA E. PINKHAM'S VEGETABLE COMPOUND is the sovereign remedy. It aims at the cause, and produces lasting results. Send to Mrs. Lydia E. Pinkham, 233 Western Avenue, Lynn, Mass., for pamphlets.

Philadelphia Police Department.

The Philadelphia Ledger of December 29, 1880 mentions, among many others, the case of Chief of Police of that City, Samuel H. Given, Esq., who says he used St. Jacobs Oil in his family, for various painful ailments, with excellent results. He has also heard from many who have used it for rheumatism, that it alone of all remedies did them good.

The best periodical for ladies to take monthly and from which they will receive the greatest benefit is Hop Bitters.

Frank Leslie, Esq., of the "Illustrated Weekly," says: "For some time past I have been using your COCOAINE, and think it far preferable to anything I have ever used for the hair."

All subscriptions received after this date, will be placed on our lists to receive the Rural New-Yorker one year, counting from the date when the subscription is received. We have no back numbers.

The Markets.

SPECIAL FROM THE CHIEF CENTRES.

Until Saturday, Jan. 22.

Boston.—BUTTER—Fine Western creameries at 33@34c.; freshly made fine Western dairies at 24@26c.; imitation creameries at 22@25c., and ladle at 20@23c. Fine Northern creameries at 30@33c., and some fine Fall ends of Vermont butter have sold at 26@28c; Summer-made Northern butter ranges from 20@25c., and long dairies for 22@25c.; common Winter-made butter is dull at 17@19c., and early made ladle butter is dull at 15@17c. CHEESE—Fine September and first half of October cheese is firm at 13½@13¾c., and some fancy lots are held higher. Fair to good cheese is held at 12@13c. EGGS—The demand is not large, and dealers buy just as wanted for present use, but there is no surplus. Eastern, choice, ₩ doz., 36c; Northern, choice, ₩ doz., 35@36c.; Western, choice, ₩ doz., 35c.; limed, ₩ doz., 25@28c. PEAS AND BEANS—Beans, Pea, Northern and Eastern, choice, ₩ bush., $1 80@1 90; Northern and Western good, $1.70@1.75; choice mediums, $1.75@1.85; fair to good mediums, $1.70@1.75; yellow eyes, $1 80@2.10; peas, Canada, common, 75@80c.; peas, Canada, choice, $1@1 05; peas, Canada, green, $1@1.50. ONIONS are in steady demand at $3.50 for red and $3.25 for yellow. There is a steady market for choice apples at $1 50@1.75 ₩ bbl., and choice lots of No. 1 fruit would command the latter figure. CRANBERRIES remain dull, with moderate sales at $4@5 ₩ bbl. for country and $6@7 for Cape. HAY AND STRAW—Northern and Eastern, prime, ₩ ton, $21@23; Northern and Eastern, medium, ₩ ton, $20@22;

swale, ₹ ton, $13@14; straw, rye, ₹ ton, $23@24; straw, rye, machine threshed, ₹ ton, $16@17; straw, oat, ₹ ton, $13@14. MILL FEED—Shorts, $17.50@18; feed, $17; middlings, $19@20.

Chicago.—WHEAT steady, with a fair demand; No. 2 Chicago Spring, 98c, bid cash; 98¾c, February; 99½c, March; $1 03¼@1 03¾, May. CORN easier at 36¾c, cash; 36¾c, February; 41¾c@41⅞c, May. OATS inactive at 30¾c, cash; 30¾c, February; 35c, May. BARLEY firm at $1 05. PORK easy at $13 25@13 37½, cash; $13 27½@13 30, February, $13 45, March. LARD active, firm and higher at $9 02½, cash and February, $9 10 bid, March; $9.20 bid April. Bulkmeats steady and unchanged. BUTTER, creamery, 27@32c; dairy, choice 22@24c; dairy, fair to good 18@20c; ladle-packed 15@17c; packing stock 12@14c; roll butter 13@17c; grease 7@9. CHEESE.—The recent advance in Liverpool from 65s to 68s and a corresponding hardening of prices at New York stimulated both the Eastern and export demands, and stocks at this point have undergone a rapid depletion. Exporters have bought largely of poor to fair grades at 3@8c. Market strong with an advancing tendency. Full cream, 11½@12¾c; part skim choice 9@9½; part skim, fair to good, 7½@8½; part skim, hard, 6@7; low grades 3@5c. EGGS.—Are firm at 30@33c. for fresh, and 24@28c. for pickled. HAY.—No. 1 timothy per ton on track $14@15.50; No 2 timothy, 13@13 50; mixed 12@12 50; upland prairie $10@11; No. 1 prairie, $8@9. POTATOES.—The market is quiet at 75c for Peachblows, and 65c for Early Rose. HOGS.—market moderately active; mixed packing, $4 80@5 05; light, $4 80@5 05; choice heavy, $5 20@5 50; market closing 5c. lower. CATTLE.—Market steady and fairly active, common to fair shipping, $3 70@4 50; butchers' steady at $2@3 50; stockers 10c. lower, at $2 65@3 85; heavy feeders wanted. SHEEP common to medium, $3 25@4 50; choice, $5@5 50.

Cincinnati.—WHEAT steady; No. 2 red Winter $1.03@1.04. CORN quiet but firm; No 2 mixed 42c. OATS quiet; No 2 mixed 37c. RYE dull; No. 2 97@98c. PORK $14; lard in good demand at $9 05; bulkmeats firm; shoulders $4 75, clear rib $7.25; bacon quiet but firm; clear rib $7.87½, clear sides $8.25. BUTTER.—Fancy Northwestern creamery sells at 35@36c.; good Ohio do. at 25@30c.; choice dairy at 23@25c.; choice Western Reserve at 22@23c.; choice Central Ohio at 18@20c.; medium to prime do. at 15@17c., and common at 11@12c. CHEESE.—Prime to choice factory at 12@12½c., but some good late made is selling at 11@11½c, and Northwestern skim at 10c. EGGS—The market is bare of fresh eggs, no wholesale trade. The few lots received during the week sold up from 30c to 35c. The few small lots offered sell in a retail way at 38@40c per dozen. SORGHUM is in better supply and the demand being light prices are barely sustained. Good to choice sells at 32@35c per gallon in lots. POTATOES—Choice Burbank are held at $2 50, and prime to choice Early Rose at $2 25@2 40 ₹ bbl. Early Rose sell in a small way from store at 80@85c, and Peachblow at 75c ₹ bushel. HAY—The market rules steady for all kinds. Common sells at $15@16, prime do. at $17@17 50 ₹ ton, and Prairie hay at $11@12 per ton, in bales on arrival. Wheat and Rye straw are firm at $9, and Oat straw firm at $10.

St. Louis.—WHEAT opened higher, but declined No. 3 Red Fall, $1 02, cash; $1,02½@$1.03¾, February; $1 05¾@$1.08¾, March; $1 06¾@@$1 07¾; April; $1.07⅝@$1.07⅞, May; No. 3 do., 92¾@93c., No. 4 do., 88½c bid. CORN. 41@41½c, cash; 41½c, January; 38¾@38¾c, February; 39½@39¾c, April; 40¾@41c, May. OATS opened higher, but declined to 32¾@33c, cash; 33@33½c, Feb.; 33¾c, March; 34¾c, April, May. RYE quiet at 87c. PORK strong at $8.35 asked 35½, cash and January; $13 47½ bid, March. Lard higher at $8 90@8 95. Bulkmeats strong and higher; Shoulders, $4.35; Clear Rib, $6 90; Clear Sides, $7.15. Bacon dull and unchanged. BUTTER—Creamery, 29@33c; dairy-packed—prime to choice, 20@22c; selections, 24@25c; low to medium, 11@16c; roll—Northern, 15@20c; country at 11@13c for poor or poorly handled to 13@15c for choice—round lots 12½@13c CHEESE—In lots, full cream 13@14c, part skims 8½c to 9½c poor skims 5c to 6c. EGGS—Very scarce: market bare of fresh stock. Sales of only a few boxes and cases fresh at 30c to 32c. Frosted dull at 23c to 25c; frozen nominal at 20c. POTATOES—Sound Western in bulk and in car lots at 65c to 75c—wagon receipts at 70@72c for Rose and 75c for Peerless; Eastern at 80c to 90c—couple cars New York Burbank in bulk and del. sold at top figure; inferior and damaged nominal at 25c to 50c. ONIONS—In limited demand, but firm. Sound at $3.75@4 per barrel, and $1 50@$1.60 per bushel; inferior or damaged less. HAY—Common prairie at $9.50, prime do at $10, choice do. at $10.50, fancy, do. at $11, mixed at $13.50@14, prime do. at $14.50, prime Timothy at $15, strictly prime do. at $15,-50; choice do. at $16, fancy do. loose pressed at $17. CATTLE—Supply light; at $4.25; butcher steers and good to choice cows and heifers, $3@4; stockers, $2.75@3 50. HOGS strong and active; Yorkers and Baltimores, $4 70@4 90; mixed packing, $4.65@5; butchers' to fancy, $5@5.25.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Jan. 22, 1880.

BEANS AND PEAS.—The market is quiet for white beans, but there seems to be no urgency to sell, as prices are named with steadiness for the lots now going into use. Red kidneys weak and drooping. Green peas dull at $1.60@1 65. Southern B. E. steady at $2 per 2-bush. bag.

Marrow beans prime $1.80, do. other $1.60@1.72, medium prime $1.70, do other $1.50@1.65, pea $1.60@1.75, white kidney $1.80@2,00, red do. prime $1.50@1.60, do. other $1.25@1.45, black or turtle soup $1.50, Lima $4@5.

BUTTER.—The export demand is a favorable feature, and the call for good to fine table American abroad accounts for the appearance of shippers, while the market here is ruling high. The home trade is steady and if not large in accordance with the season, there is enough doing to harden prices. Dairies and round lots of firkins are scarce, and a buyer who wants a perfect one will pay a trifle above last week's full figures. Western butter is in good demand and not plenty in the styles wanted for good local use. It must be understood that top prices are in a measure exceptional; at this season a good deal of retail trade has to be humored and buyers who have a steady run can obtain many goods at inside figures, especially when quality grades down.

Creamery, fine Western, 31c good to prime, 31@33c; fair to good 27@30c. State ranges, 20@30; State dairies, entire choice, 25@26c; fair to prime 2@24c.; firkins, 20@24c.; State pails and half tubs, full, 28@29c, fair to prime, 23@24c.; poor to fair 20@23c.; Welsh tubs, choice 26@27c; other 19@23c. Western imitation creamery 20@27c.; dairy, fresh, 21@25c; other 16@22c.; factory, fine, 22@23c.; other 14@20c. low quality, 12½@13c.; rolls, choice 18@19c, fair to good, 17@18c.

Receipts for the week 29,824 pkgs.

Exports for the week, 9,727 pkgs.

CHEESE.—Export demand continues very good, and the home trade fair, with prices strong. Low grades of cheese are materially helped in the new movement.

State factory, fancy, at 13½c.; do. good and prime, 12¾@13¼c.; do. fair to good, at 11¾@12¾c.; do, h'f skimmed, 9@11c.; Wisconsin factory, fine, at 13@13¾c; do. good to prime, 12¾@12¾c.; do. fair to good, 11@12c.; Ohio factory, fine, 12¾@13¼c.; do. good to prime, 12@12¾c.; do. flat, fair to good, 10¾@11¾c; do. poor to fair 8@11c.

Receipts for week, 33,300 boxes.

Exports for week, 45,325 boxes.

Liverpool cable, 68s.

Steam to Gt. Britain, 30s.@37s. 6c.

COTTON—The market has varied little in price and demand moderate; latest prices are for

January at 11.60@11.62c.; February at 11.71@11.72c.; March at 11.90@11.91c.; April at 12.05c.; May at 12.18@12.19c.; June at 12.30@12.31c.; July at 12.40@12.41c.; August at 12,44@12,46c.; September at 11.92@11.95c.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted.

Strict good ordinary	9¾	Middling	11¾

Receipts for the week, 28,245 bales. Exports do. 5,140 do.

DRIED FRUITS.—Apples are in fair demand, exporters buying sun-dried stock chiefly, with prices steady. Peaches are moderately active. Small fruits are quiet. Quotations are for

Evaporated apples at 8¾@9c. for the better qualities (some lots held higher), sliced apples at 5@6¼c. for good to choice North Carolina; 3½@4¼c. for Va, Tapples, 4@4¾c. for Tenn. do; 4¾@5¼c for State do; 4¼@5¼c. for western Ohio and Mich. Peaches at 20@32c. for evaporated peeled; 16c. for unpeeled do.; N. C. peeled at 20@21c.; for the better qualities, unpeeled peaches at 6¾@7¾c. for halves and 6½@7c. for quarters. Plums at 15@16c. Blackberries at 8c. Cherries at 17½c. Raspberries at 24@25c. Whortleberries at 12½@13c.

EGGS—Receipts for the week 1,029 bbls.; do. last week, 1,060 bbls. The market is almost bare of stock, in fact there are not enough limed left to piece out common wants, and almost "war prices" rule for the limited offering. Prospects of better supplies very slim.

Near Points, ₹ doz., 45@46c: State and Penna. 43@44; Western and Southern fresh 42@43; stored Western and fall laid 38@40c.; State limed 37c; Canadian and Western 36@37c.

FLOUR.—Buyers have found rather easy prices on very fair receipts.

Quotations are: $3.10@3.75 for very inferior to very choice superfine State and Western; $4.10@4 50 for poor to choice extra State and Western, odd lots and lines; $4 50@4 65 for choice to fancy do.; inferior to good white wheat, trade and family extras, $4 25@5.10; good to choice do. at $5.10@5.90; (very choice up to $6 25;) red and amber winter wheat inferior to choice trade and family, at $4.20@5.85; round hoop Ohio, $4.25@4 65; and trade and family brands of do at $4.30@6.25, the latter for fancy; St Louis $4.40@5.25 for inferior to good extra; $5.25@6.25 for good to very choice (fancy brands quoted higher); Minnesota clear, inferior to very choice at $4 15@5.; Minnesota "straight," poor to very choice, at $5 25@6.75, and patent inferior to fancy at $5.75@8.25; city mills extras at $5.20@5.35 for fair to choice for the West Indies; do. for England at $4.10@4.50 for poor to choice spring wheat, and $4.85@5.50 for winter wheat product; do. trade and family extras, $5.85@6.75; do. for South America, $5.45@5.85, the latter for very choice; No. 2 at $2 85@3.50 for very inferior to fancy.

Receipts for week, flour, bbls, 111,525; corn meal, do, 2,850; wheat, bush, 546,850; corn, do, 174,750; oats do, 265,600; rye, do, 14,200, malt, do, 15,116; barley, do, 88,200; beans, do., 8,748; rice, pkgs, 2,836

Exports for week, flour, bbls, 95,900; corn meal, do, 2,600, wheat, bush 627,250; corn, do, 127,215; oats, do, 3,473; peas, do, 5,664; beans, pkgs, 726; rice do, 740.

CORN MEAL—Sales at $3.35 for Brandywine, and $2.65@3 25 for yellow Western.

FRESH FRUITS.—Exports of apples for week, 11,325 bbls, The home demand for apples is moderate and prices are only steady. There is an improved trade in England and prime lots may again have a movement here for export if prices do not impede. Cranberries quiet with what is thought to be a manageable stock. Florida oranges are still in that unsatisfactory condition where good ones have to make up for damaged: this causes conflicting figures and the market is reported poor. Peanuts are easier at the South and the market here is not so sharp as it was. Dealers look for a decline here.

Apples, Baldwins $1.75@1.87; Greenings, $1.62@1.75; Spitzenbergs, $1.75@2; mixed apples $1.50@1.75. Cranberries, Cape Cod fancy bbls., $8; other $4@7; N. J, crates, $1 75@2.25. Florida oranges, repacked standard cases $1@1.50, ordinary to good as they run $2@3. Peanuts, Va. hand-picked 4¾@5c.; other 3½@4¾, shelled 3½@4½c. Hickory nuts $1.00@1.12. Black walnuts 40c. Pecans nominal.

FURS AND SKINS.—The market is quiet and the early January sales are looked for with some solicitude. Thus far there has been no shipping encouragement, but the severe snow storm of last week in England may help to "boom" some items.

GRAIN.—Wheat shows shipments for the week of 513,000 bush.; prices have ruled easy on the moderate export demand; latest sales are of

No. 1 white at $1.14¾@1.15¾, do. January at $1.14¾@1.15, do. February at 1.15¾@1.15¾, do. March at $1.16¾@1.16¾; do. May at $1.16¾; do, steamer grade at $1.13½; No. 2 white at $1.13¾@1.14; ungraded white at $1.12¾@1.15; mixed winter at $1.16@1.16¾; No. 2 red at $1.18@1.18¾, do January option at $1.17¾@1.17¾; do. February at $1.18¾@1.18½; do. March at $1.19¾@1.20¾, do, April at $1.20¾@1.20¾; do May at $1.20¾@1.20¾; No. 3 red at $1.16@1.16½, ungraded red at $1.13@1.18, New York No. 2 Spring at $1.13¾@1.13¾, No. 2 Milwaukee spring at $1.17; No. 3 spring at $1.07¾@1.18; rejected spring at 85@88c.

Rye at 97@$1.01.

Corn is fairly active latest prices are for

New York No. 2 at 55¾@56c. do. January at 55¾, do. February at 56, do. March at 55¾, do May at 54¾, ungraded mixed Western at 53@56, New York steamer mixed at 53¾@53¾, New York No. 3 at 52¾@53, steamer yellow at 54¾; low mixed a 56½; steamer white at 56¾c.

Oats are easy in price; latest sales are of

No. 1 white 48¾@48¾; New York No. 2 white at 47¾@48; No. 3 white at 44¾@45; New York No. 2 at 43¾@43½, do. January at 43½, do. February at 43¾@44, do March at 44¾@44¾, No. 3 at 42½@43, ungraded white Western at 43½@47¾, ungraded mixed Western at 42@41, white State at 45½@48¾, No. 2 Chicago at 43¾.

HAY AND STRAW.—A good degree of activity and prices well maintained. Quotations are for

Hay, prime timothy at $1.20 ₹ 100 lbs., medium timothy at $1.10@1.15 do. shipping grades at $1@1.05 do.; clover mixed at $1.05@1.10, clover at 95c@$1, do. Straw—No. 1 rye at $1.25@1.30 ₹ 100 lbs.; No. 2 rye at 75@85c, do.; oats and wheat at 70@75c. do.

HONEY—Market almost nominal at recent figures. White clover, comb, single, 16@17c.; larger pkgs. do. 14@15c.; buckwheat 11@12c.; extracted 6@10c, as to color.

HOPS.—There is a moderate export movement only and brewers buying sparingly. Prices steady and unchanged. Quotations are for

Receipts for the week, 4,322 bales.

Exports for the week, 1,208 bales.

MILK.—Supplies have been light, and though the market has fluctuated the average has been in farmer's favor. Closing rate for commission milk, $2 ₹ can of 40 qts., after having sold at $1,75 up to $2.25.

OIL-CAKE.—Western is quoted at $29 per ton.

POULTRY AND GAME.—Supplies of dressed poultry are moderate and there is no call for heavy receipts, Western dry-picked turkeys do not sell much better than scalded; buyers of dry-picked at this season generally want near points and these have regular purveyors, Fowls and chickens generally sold at inside rates. Ducks scarce; geese steady.

Turkeys, N. J. small, 13@13½c.; other, 11½@12½c.; State, small, 12@12½c.; other, 11@13c.; Western, small, 11½@12c.; other, 10½@11c.; poor to fair, 8@10c.; Philadelphia d.-p., 12@14c.; chickens, choice, 14@15c.; good to prime, including scalded, 11@13c.; poor 9@10c.; chickens and fowls, W. 9@11c.; capons, 20@21c; slips, 16@18c.; fowls, good to prime, 10@12c.; do. poor, 9c; ducks, choice, 16c.; other, 10@15c.; geese, choice, 12c.; other, 8@11c.; squabs, white, ₹ doz., $3.50; do. dark $1.50@2.

Live poultry is in small supply and prices are steady.

Fowls, 10@11c.; chickens 8@9c.; roosters, 5@6c.; turkeys, 9@11c; ducks, best, 75@87c, other 50@70c. Geese, extra, $1.37@2; other $1.25@1.75. Pigeons, 20@25c.

Game is not plenty, but the general want is small. Prices firm for all prime lots suitable for hotel, steamer and first-class city use.

Missouri wild pigeons, ₹ doz., $1.12; canvas back ducks $1.25@2, red-heads 50@75c., mallard 40@50c.; teal 30@40c, black do. 40@50c.; common do, 25@30c.; quail prime trapped ₹ doz $2@2.25; do. inferior $1.62@1.75; partridges, ₹ pair 70c.@$1; Grouse prime $1.10@1.15, do. drawn 90c.@$1. Hares, 30c, Rabbits, 25@30.

PROVISIONS.—Hog products have been in moderate demand and prices generally steady.

Mess pork quoted at $13.25@13.50 for spot lots; $14@14.25 for February, and $14.20@14.30 for March. Bacon at 7¾ for long clear and 7.75 for short clear. Lard—Western steam at 9.42½ for spot lots, 9.40@9 42½ for Jan. and Feb., 9.50 for March, and 9.57½ for April. Stearine at 9¾. Tallow at 6¼ for prime.

Receipts for week, beef, bbls, and tcs., 1,100; pork, 1,250 bbls. cut meats, 39,917 pkgs.; lard, 22,914 pkgs.

Exports for week, beef, bbls, and tcs., 1,700; pork, 5,100 bbls.; cutmeats, 17,994,013 lbs.; lard, 6,941,574 lbs.

SEEDS.—Clover is in moderate demand; quoted at 7¾@8¾c.; Timothy is quiet at $2.75@2.85.

TOBACCO.—Export trade moderately active and the home demand fair, with prices generally as last week.

WOOL.—A moderate trade only this week, with prices easy. Medium Ohio fleeces sold at 50@51 spring California at 25@35, spring Texas at 25@28, fall Texas at 25@30.

LIVE STOCK MARKETS

NEW YORK, Saturday Jan. 22, 1880.

BEEVES.—Receipts for the week 11,523 head: do. last week 13,451 do. Butchers were evidently in want of cattle from the numbers that attended in the almost unprecedented storm of yesterday. Cattle were generally of good quality, which helped trade. Supplies were small owing to the storm. The bulk of the sales were at 9@10¾c., dr. 56@57 lbs.; nothing below 8¾c., to dr. 55 lbs. A few extras sold at 6¾c. live weight. All rates higher than last Wednesday.

COWS AND CALVES.—The market is an undecided one, now and then a prime milker bringing $80 and even $85; but the general buyers will not pay over $50 for prime straight car loads; the range for the week may be called $35@60.

VEAL CALVES.—Live have been scarce and firm prices have ruled; dressed active and firm for unfrozen lots.

Live choice fed 8¼c. poor to prime 6@8 Mt. Holly 5@8, buttermilk, 3@4, grass, 2½@3, hog-dressed choice 11, fair to good 9¾@10¾, common 4@7.

SHEEP AND LAMBS.—Receipts for week, 24,612 head; do, last week, 29,350 do. Market now with smaller supplies. Common to fair sheep 4½@5¾c.; good, to prime 5¾@6¾. Common to choice lambs 6@7¾.

SWINE.—Receipts for the week, 26,786 head: do. last week, 42,728 do. No live hogs on sale; tendency of the market down. Nominal price for corn 5¾c.; Country dressed pork light 7¼@7¾c.; medium, 7@7¼c.; heavy, 6¾@6¾c.; city dressed State 6¾@7¼, city dressed Western 6¾@6¾, Western dressed 6¾@6¾. Pork tenderloins 12¾.

TERMS FOR 1880.

THE subscription price of THE RURAL NEW YORKER is

Single Copy, per Year	$2 00
" " Six Months	1 10
Great Britain, Ireland, Australia and Germany, per Year, post-paid	$3 04 (12s. 6d)
France, " "	3 04 (16¼f.)
French Colonies, " "	4 08 (20¾f.)

Any one sending a club of eight is entitled to one copy, one year, free.

Agents will be supplied with canvassing outfit on application.

Entered at the Post-office at New York City, N. Y., as second-class mail matter.

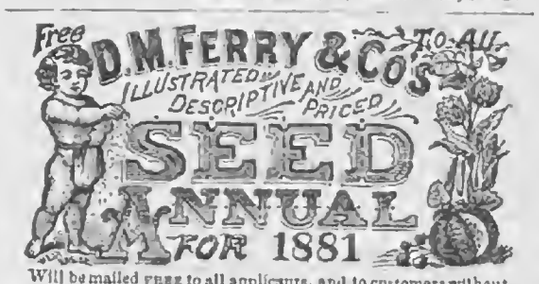
THREE MONTHS ON TRIAL for 10 cents THE PEOPLE'S JOURNAL, Hagerstown, Md.

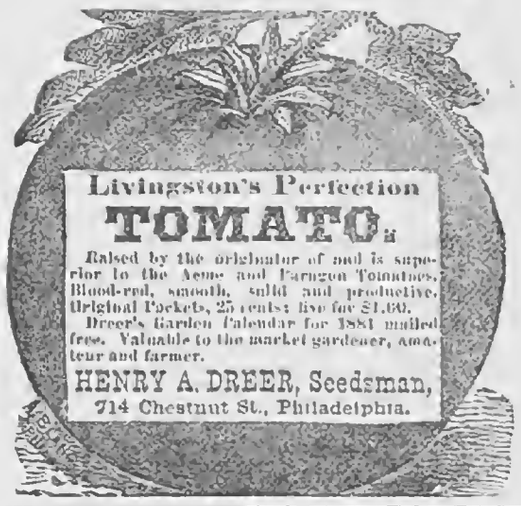
YOU SURPRISE ME with your liberal offer! Nevertheless we will send you a "gem of an autograph album" of 40 pages and a book of 300 choice selections, all for 7 three-cent stamps. As to our reliability, inquire of this paper. Address
BURT & PRENTICE,
46 Beekman St., New York.

TO GARDENERS.
Free Sample Packet of Seeds and Catalogue of choice Vegetable and Flower Seeds, Plants, Implements, etc. It contains useful hints for Onion Growers and Market Gardeners. All goods are first class and cheap.
TUTHILL GREINER, Naples, N. Y.

Is an Elegant Book, of 100 Pages, One Colored Flower Plate and 600 ILLUSTRATIONS, with Descriptions of the BEST FLOWERS VEGETABLES, and Directions for growing. Sent free, by mail, for 10 cents. In English or German.
VICK'S SEEDS are the best in the world. The FLORAL GUIDE will tell how to get and grow them.
VICK'S ILLUSTRATED MONTHLY MAGAZINE—32 Pages, a Colored Plate in every number and many fine Engravings. Price $1.25 a year; Five Copies for $5.00. Specimen Numbers sent for 10 cents; 3 trial copies for 25 cents. Address,
JAMES VICK, Rochester, N. Y.



Will be mailed FREE to all applicants, and to customers without ordering it. It contains five colored plates, 600 engravings, about 200 pages, and full descriptions, prices and directions for planting 1500 varieties of Vegetable and Flower Seeds, Plants, Roses, etc. Invaluable to all. Send for it. Address,
D. M. FERRY & CO., Detroit, Mich.



Raised by the originator of and is superior to the Acme and Paragon Tomatoes. Blood-red, smooth, solid and productive. Original Packets, 25 cents; five for $1.00.
Dreer's Garden Calendar for 1881 mailed free. Valuable to the market gardener, amateur and farmer.
HENRY A. DREER, Seedsman,
714 Chestnut St., Philadelphia.

SEEDS
We will send our Catalogue for
1881
Containing a full and descriptive list of
FLOWER SEEDS,
VEGETABLE SEEDS,
Gladiolus, Lilies, Roses,
Plants, etc.
beautifully illustrated with colored plates,
free to all who send their address.
Application may be made to
179, 181, and 183 Main Street,
Rochester, N.Y.
or 174 E. Randolph St.
Chicago, Ill.
HIRAM SIBLEY & CO.
ROCHESTER, N.Y. & CHICAGO, ILLS

SEEDS! PURE, Fresh and the Best.
They are home-grown; they have stood the test of years. Try them. Handsomely illustrated Garden Manual, mailed free. BE SURE to send for this before ordering. Market Gardeners write for *Special Price List.*
J. B. ROOT & CO.,
Seed Growers, Rockford, Ill.

GRAPE VINES.
All leading varieties in supply. Warranted true to name. Prices low. Also the celebrated NEW WHITE GRAPE, PRENTISS. Also trees, small fruits, etc. T. S. HUBBARD,
FREDONIA, N. Y.

Reading for the Young.

FARMING FOR BOYS AND GIRLS—NO. II.

HENRY STEWART.

Fertilizing the Soil.

ALTHOUGH the soil is a vast storehouse of plant food, yet it is easily exhausted by a few years of poor farming. One may take a piece of the richest land and grow crops on it for several years without putting any manure on it; but the end will be, sooner or later, that the crops become lighter year by year until they become so small that they will not pay the farmer to work them. This has been the history of thousands of farms in this country. The farmer has found his income too small to maintain his family and his children have been obliged to leave home, the boys to go West to work for their living and the girls to seek employment wherever they may be able. This unfortunate result has been due to poor farming. Thousands of other farms, now rich and productive are rapidly approaching the same fate, and unless this unwise practice is stopped in time, many places in the West will become as unproductive as some parts of the older States now are. And yet by looking at the soil of an exhausted farm, one cannot see any difference between its present appearance and that when it was in its first productive state. The soil is there, no grass grows upon it, poor weeds and stunted bushes may alone appear in place of rich crops of wheat or corn, but the soil itself has not changed so far as can be seen. When some of this soil, however, is taken to a chemist he will find that it contains no potash, no phosphoric acid and no nitrogen that can be taken out of it by steeping it in water. He will tell us that it is deficient in soluble or available potash, phosphoric acid and nitrogen, and as plants can take up only such food as is soluble, they starve in the midst of plenty which they cannot reach. If one were to put a quantity of corn in small bottles or tin boxes, and mix it with some loose corn, and give the whole to a flock of fowls, they would pick out the loose corn until that was all eaten, and then, although there might be plenty of food in the bottles or boxes, the fowls would go hungry and starve, in time, although there was plenty of food there; but they could not get at it. In almost a similar manner the fertile elements of the soil are presented to the roots of plants. These pick out all that they can reach, and when that is consumed, they can get no more; although every little particle of the soil contains plenty of food for them, but so locked up that they cannot avail themselves of it. If the fowls could wait until the tin boxes rusted away, or if we should go among the glass bottles and break them up, there would be more food for them; so if the farmer could wait until the air and water wear away the surfaces of the particles of the soil, or if he goes with his plow and harrow and works the soil and breaks it up so as to hasten this effect of the air and water, or if he puts lime or ashes, or other substances which help to produce the same effect, he could increase his crops to some extent.

But this process would be too slow and he must find some better plan than that. He is then obliged to fertilize the soil in some manner. He can do this in various ways. He can avoid growing one crop year after year, and growing a variety of different crops in successive years, taking care that one or more of these shall leave on the ground a quantity of roots, or stems, or leaves, such as grass or clover, a sod in fact, which he can plow in. Then with the addition of some lime occasionally, he may put off for many years, the time when the soil may be worn out. This is one way of fertilizing the soil, and is known in farm practice as the rotation of crops. When skillfully applied this practice is of great use, because as one crop takes less of potash or phosphoric acid from the soil than another, while this is growing, time is given for the soil to let loose some of these elements and store them up for a future crop which needs them. Another way of improving the soil is by plowing under clover which is more easily grown than a grain crop, and which has a very beneficial influence on the soil, not only by adding its own substance to it, which has been derived from the soil and which consists to a large extent of the same substances as the soil, but it has a useful effect in dissolving part of the soil so that other plants can feed upon it. Another way of improving the soil is by feeding some of the coarser portions of the crops to cattle or sheep, and by using the straw as litter, and saving the dropping of these cattle with the soiled straw and spreading the whole on the land. With all these helps together, viz., by growing crops in rotation, by plowing in a sod, by using lime occasionally and by making and using manure, and by plowing and working the soil so as to cause it to dissolve as much as possible, the land may be kept in a fertile and profitable state, and the farmer can support himself and his family comfortably. This is good farming, and the man who knows how to do all this in the best manner is a good farmer.

If the whole of a crop of wheat, of 33 bushels, or one ton of grain, and two tons of straw, were burned, there would be left 240 pounds of ashes; the wheat would leave 40 pounds and the straw 200 pounds. This ash all comes from the soil and there would be from the wheat 12 pounds of potash, 18 pounds of phosphoric acid; five pounds of magnesia; 1½ pounds of soda and 1¾ pounds of lime; from the straw there would be 23 pounds of potash; six pounds of soda, five pounds of magnesia; 12 pounds of lime and 10 pounds of phosphoric acid. So that before we can grow a crop of 33 bushels of wheat to the acre, the soil must be able to furnish all this mineral matter in a soluble condition. The heat, smoke and vapor from the burning, would contain the nitrogen and carbon. The nitrogen only is taken from the soil; the carbon is supplied by the air, and we need take no care about that; but we must see that the nitrogen is supplied, if we would have the wheat. There would be in the wheat and the straw about 60 pounds of nitrogen and this *must* be in the soil, although all the others are there; if this is wanting and there is plenty of the potash and phosphoric acid these will be of no avail, the wheat cannot grow without the nitrogen. In fact the soil must contain every element needed, for if one only be absent, the crops will not grow. So that for the complete fertilizing of the soil the farmer must not only know what each crop demands from it, but how he can best supply these demands, as well as to provide the requisite elements to provide for them.

DAISY'S YEAR IN SOUTHERN CALIFORNIA.

BY ALICE P. ADAMS.

The Arrival.

IT was a pleasant afternoon in early March, and a boy of sixteen with a girl two or three years younger waited at the San Gabriel station for the train from Los Angeles.

"Dear me! it seems as if that train never *would* come. I know it's behind time. What if they have had an accident!" and Miss Violet's rosy face lengthened visibly at the bare thought.

"Oh fudge! Don't be a goose, Violet Erman. I told you we would be too early, and it's just three to a second." Bertram consulted his watch of which he was very proud—"no better timepiece in the world" if we do not doubt the authority of the owner.

His sister was convinced, though by no means contented. "Fifteen whole minutes to wait! I never can do it! (How will you help yourself?" put in Bertram, parenthetically.)' You needn't laugh now, Bert. I know I'm excited, and I don't care. When I think of that darling Daisy Heberden that I havn't seen for over three years, and know she's coming on this very train, it seems as if I should fly!"

"Oh I wouldn't, my darling," said Bertram in a wheedling tone; "I'm afraid you would have no better luck than the renowned Darius Green."

"You provoking boy to make fun of me so! If that lanky John Thomas was coming you would be in just as great a hurry as I am!"

"Well, supposing I drive on a little. The time will pass quicker, and you will have a chance to cool down; for you don't want to smother the girl the minute she steps off the cars, and her life is certainly in danger from present indications."

"No, no, don't you stir a step; for the train might come in, and what would she think if none of us were here to meet her?" So Violet fussed and fidgeted while the time wore away, and an almost imperceptible rumble grew louder and louder until the train finally swept in sight, and at last stopped at the station.

Bertram was on the platform ready to assist the stranger, while Violet held the ponies. What, if Daisy had not come after all, she thought as she waited in painful suspense. There was old Mr. Smith getting off, and two or three of the neighboring ranchman, and some of the winter visitors at the Mission, and then a pale-faced girl in an ulster and dark felt hat. Could that be Daisy? Yes it must be, for Bertram was talking with her; and he soon brought her to the impatient watcher who dropped the reins, jumped down without any assistance, and hugged her friend, regardless of time, place and spectators.

"Oh, you darling girl, I was so afraid that something had happened and you hadn't come. It is rather mean in me, but I can't help feeling glad that you were not very well, and I could embrace the doctor for advising your father to send you here. I don't see though, how they made up their minds to let you come." Violet stopped for a breath.

"Mother said, at first, that she never could consent to my going so far away; but when she found that I didn't grow any stronger after I left school, and I had the headache so much, she finally said she would agree to the plan. If the doctor thought the change would help me."

"I wish the rest could come, too."

"Oh, they couldn't leave home, and they never would have let me come if your family hadn't been here. You know we lived next to each other as long as I can remember, until you moved here, and mother said she would rather trust me with your mother than any one she knows."

"I must remember to tell mamma that; she will consider it quite a compliment," said Violet, smiling. "We don't intend to let you be homesick a minute. Here comes Bert. I suppose he has been to look after your trunk; so let's get in. We brought the wagon so that we could take your baggage right home."

The trunk and satchels were bestowed in the spring wagon, Bertram touched up the ponies, and away they trotted. "Where did you leave Mr. Ford and his wife?" he asked, referring to Daisy's traveling companions, who were old acquaintances and had taken care of her during the overland trip.

"They stopped in Los Angeles. Mr. Ford wanted to come out here with me, but I told him that I could come alone this little way."

"When did you get in town?" asked Violet.

"About two, I should think, for it was only a short time before I took the train for San Gabriel; so I have seen nothing of the city."

"Then we shall have the pleasure of showing you all the 'lions,'" said Violet.

On trotted the ponies through the Mission—the Mexican village—whose strange sights made Daisy's eyes open wide.

"Here is the church—over a hundred years old. Some day when we are down for the mail we'll go inside. You will have a chance to learn the Mission by heart, for some of us come every day."

"How queer everything seems," said Daisy. "And the Mexicans look so fierce—I should think you would be afraid of them."

"Oh, dear no!" laughed Violet. "I used to be when we first came here, but they seldom molest any one. They fight among themselves, and the most of them steal whenever they get a chance, but they never have any pitched battles with the white people."

"Well, Daisy, did you leave such weather as this at home?" asked Bertram.

"Indeed I did not. It has been pretty cold there all Winter, and we started right in the middle of a raging snow storm. It seems perfectly wonderful to me, notwithstanding all you have written, to see the hills and plains so green, and the flowers blooming out doors. I can hardly believe that this is the first day of March. It is more like the first of June!"

"I suppose we have become so accustomed to the weather that we don't appreciate it as you do. But it certainly is delightful; and I cannot see how you manage to exist back East with the wretched weather you have," and Violet gave vent to a sigh as she considered the doleful condition of the unhappy people who dwell east of the Rocky Mountains. "You freeze in the Winter, and have sun-strokes in the Summer, and when you have a few really pleasant days, you are so proud of them."

"Oh-h!" A little scream from Daisy interrupted Violet's rather needless tirade. They had reached a long hill, and Bertram put on the brakes and let the ponies trot down.

"What is the matter?"

"I'm afraid to go down here so fast. Won't the horses run away?" inquired Daisy, anxiously, holding fast to the seat.

"Why, there is no danger," said Bertram. "Don't you see the brake? When I move it forward with my foot see how those pieces of wood hold the hind wheels; and I can put it on so far that the wheels will be locked and can't move at all."

"What makes you have those old shoes on the blocks of wood?" asked Daisy, breathing easier now that they had reached level ground.

"We have to put on something to protect the wood, for the wheels would soon cut a hole in it; and a cast-off shoe, minus the heel, seems to answer the purpose better than anything else."

"That's one way," said Daisy, laughing. "But I thought it hurt horses to go so fast down hill."

"It don't hurt these *broncos;* they are tough as sole-leather."

"What makes you call them *broncos?*" asked Daisy.

"That is the name given to the Mexican horses to distinguish them from the American breed. Now that bay pony"— Bertram commenced a disquisition upon this particular *bronco*, which was interrupted by Violet:—

"Here's our house! Rather different from the one back East, isn't it, Daisy?"

They left the main road and drove up the avenue, at the end of which stood the cottage, half hidden by trees and vines; and in the door, hospitably open, stood Mrs. Erman, who welcomed Daisy with a motherly hug and kiss, saying, "How glad I am to see you, dear child!"—To be continued.

CURIOUS TREES.

There is a tree which grows way off on the island of Madagascar, called the Traveler's Tree, or, as botanists would say, it is Ravenala Madagascariensis. But that is such a long name we will call it by the former. The Traveler's Tree rises from the ground with a thick, succulent stem, and grows to the height of eighty feet or more. The leaves are very long and broad, sometimes reaching a length of five feet, and these are borne on a stem or stalk from 6 to 8 feet long. These spread out in a fan shape and present a very beautiful appearance. But the strangest thing about this tree is that it contains in its leaves a great quantity of water which the traveler over the arid regions may easily procure. Sometime ago, a missionary who was on the island, thought he would see whether or not there was any hoax about this "water-bearing" tree, so he went to a grove, and, with a spear or sharpened stick pierced the lower part of one of the leaf-stalks, and sure enough, a small stream of water spurted out to his great surprise. It was found on examination that on the inner side of each of the stalks there was a narrow channel running down from the base of the leaf to the body of the tree. This seemed to collect the water condensed from the atmosphere by the large, cool surface of the leaf, and conducted it downwards. Thus a cooling draught is ever ready for the thirsty traveler though springs and wells are not at hand.

The Cow Tree is another curious member of the vegetable family, and probably receives its name from the fact that it furnishes milk much like a cow's. Whenever the inhabitants of Venezuela (for it is there that this tree grows) wish a little milk for their tea, instead of going out to the cow for it, as farmers' boys are accustomed to do, they take a knife or some other sharp-edged tool and make a little incision or cut in the bark and from it flows a milky juice. This milk, unlike most vegetable juices, is very wholesome and nourishing, possessing an agreeable taste like that of sweet cream, and a pleasant, balsamic odor, its only unpleasant quality being a slight degree of stickiness. So, in nature, man's wants are provided for in many ways, and therein the wisdom of the Creator is made manifest.

UNCLE MARK

LETTERS FROM THE COUSINS.

DEAR UNCLE MARK:—I go to school and read in the fourth reader. My grandpa takes the RURAL, and I like to read it, especially that part containing the cousins' letters. I would like to join the Horticultural Club, if you will permit me. I am very fond of flowers, and we have quite a variety of house plants, some of which are now in bloom. Will you please remember me when you send seeds? Your niece. IDA.

Mountain View, Passaic Co., N. J.

DEAR UNCLE MARK:—I thought I would like to be one of the little cousins. I am a little girl nine years old. I was born in Arizona but afterwards we moved to Texas. Mamma takes the RURAL and I think it is a very nice paper and I love to read the little cousins letters. I have been to school 15 months. Papa owns a flock of sheep and I have seven head of my own. I would like to have flower seed to sow next Spring. I don't dare to write much for fear my letter will go into the waste basket. JENNIE CURTIS.

Fort Griffin, Texas.

DEAR UNCLE MARK:—I am a little girl six years old last May. I cannot write so I have got mamma to write a few lines for me. I have a brother about nine years old. We love flowers very much, especially the RURAL'S. We wanted ma to write last summer so you could put us on your list but she did not. No more this time but if I see this in print you will hear from me again.

CORA MAY WARD.

[Will Cora please send her address. U. M.]

Sabbath Reading.

"LET THY WILL BE DONE."

"Thy will be done!" Not lightly be it spoken,
To fall like tinkling cymbals on the air;
Beyond all other words are these the token
Of resignation conquered from despair.

Not all who say "Lord! Lord!" can tell what measure
Of heavy cost it takes their depth to learn;
What loss of ease, what sacrifice of treasure,
What exile, out of which is no return.

He who has proved this saying bears the traces
Of furnace-fires that spare the gold alone;
His conversation is in Heavenly places;
His life is lived as God's, and not his own!

His soul in restful patience he possesses,
Nor sighs for hopes that vanish unfulfilled,
As one who meets with loss, yet still caresses
Regretful dreams with spirit half self-willed.

No more in things of time his heart is centered,
For he has seen their preciousness decrease;
Has weighed the world, and proved it void, and entered
The upper chamber of abiding peace.

"Thy will be done!" O! utterance magnetic!
That thrills anew the soul's diviner chord,
With deep compassion for that woe prophetic
Which filled the anguished chalice of our Lord.

Behold in that sublime self-abnegation,
What lowly path the Man of Sorrows trod
And know that out of thy humiliation
Shall know the grace to stand before thy God.

Then not with lip irreverent be spoken
The hallowed words of God's all-suffering Son;
But say with contrite heart and spirit broken,
Through loss, through sorrow, "Let Thy will be done!" —Frances E. Pope, in Advance.

"NEARER, MY GOD, TO THEE."

This language was the heart-utterance of Mrs. Sarah Flower Adams, who was born in Cambridge, England, in February, 1805, and whose history has been but very slightly known to the great public, who have cherished her hymns as one of the most sacred treasures for nearly half a century. Her father was the editor of a weekly Cambridge paper. Her mother was a woman of fine gifts and culture, and she herself was the youngest child. She was noted in early life for the taste she manifested in literature, and in maturer years for great zeal and earnestness in her religious life. She contributed prose and verse to the periodicals of the day, and her art criticisms were valued. Married at an early age, and of frail constitution, she still, amid many bodily sufferings, kept her pen busy, her thoughts and writings always tending upwards. At what time and amid what circumstances she caught the inspiration from which evolved that wonderful hymn which has since echoed round and round the globe, is not known; but it was probably during some period of peculiar trial, when her spirit was uplifted through sorrow almost above its earthly body. She little dreamed that her hymn, like those of Toplady, Charlotte Elliot and Ray Palmer, would be heard through the ages.

It was first published in 1841, in a volume of sacred lyrics issued by Mr. Fox, of England, just eight years before the death of the gifted authoress, who only lived to the age of 44, and thus never knew the fame which was to attach to her hymn and her name. The hymn soon began to appear in various collections, and was everywhere received with delight. It was given the tune "Bethany," which became very popular in this country. Everybody who has grown up in a Christian land knows it by heart, and in many countries which do not float the banner of Christ, it is almost equally familiar.

"Last year," says Dr. Culyer, in his "Heart Life," "Professors Smith, Hitchcock and Park, as they wound their way down the foot-hills of Mount Lebanon, came in sight of a group of fifty Syrian students, standing in a line, singing in chorus. They were the students of the new 'College of Beirut' at Abieh, and they were singing in Arabic to the tune of 'Bethany.' As the procession drew near they caught the sublime words:

"'Nearer, my God, to thee!
Nearer to thee:
E'en though it be a cross
That raiseth me,
Still all my song shall be,
Nearer, my God, to thee,
Nearer, my God, to thee,
Nearer to thee.'

"'I am not much given to the weeping mood,' said Professor Hitchcock, when describing the thrilling scene; 'but, when we rode through the ranks of those Syrian youths, I confess that my eyes were a little damp.'

"If it be permitted to the departed people of God," continues Dr. Culyer, "to witness the transactions of earth we may imagine with what rapture the glorified spirit of Sarah Flower Adams heard her heart-song thus chanted in the land of sacred story."—Boston Musical Herald.

PERSONAL ITEMS.

Professor Legate, of Nevada, says that the moon's rays spoil fish, and that his experiments prove it.

Of the seventy-six United States Senators only thirty-three were born in the States which they represent.

General Garfield's step-father, William Belden, died near Grand Rapids, Mich., on Friday night week, aged seventy years.

Mr. Gladstone is reported by his wife as singing every morning in his bath, and the inference is that he is not much worried by the Irish agitation.

General Grant has engaged an architect to make such repairs upon his cottage at Long Branch as are necessary, and put it in complete order for his occupancy next Summer.

Judge Gere Black, who is seventy-one years old, is a great favorite in Washington society. He says that he is a pretty old man, but that he did not write Coke's law books.

Alvin Hawkins was inaugurated Governor of Tennessee at noon last Tuesday before a large assemblage of people. He is the first Republican Governor that State has had for ten years.

Olive Logan, writing from New England, says that cold pork and beans for breakfast, bean porridge for dinner and warmed-up beans for supper constantly remind her of the part of the country which she is visiting.

United States Senator McDonald, of Indiana, after his term expires next March, will return to his old profession as a member of the law firm of McDonald & Butler, at Indianapolis. He is quoted as saying: "The practice of my profession has been my life business and politics but an episode."

Dawson habitually whipped his wife at Paducah, Ky. Wyatt, his neighbor, said to him, "If you don't stop the practice I'll kill you." The next time Mrs. Dawson screamed, Wyatt went in and kept his promise by shooting her husband through the body, though the wound did not prove fatal until a week later.

Mr. Philip Armour, the wealthy Cincinnati merchant, and Manager Carpenter, of Chicago, both of whom died a few days ago, lost their lives through overwork. Mr. Armour was thirty-eight years of age and worth, it is variously estimated, from $2,000,000 to $7,000,000, and Mr. Carpenter was successful at thirty-six years.

DR. LUCY S. PIDGIN of Boston, who graduated last March from the United States Medical College, of New York, being number two in a class of sixteen, has been elected secretary of the West Side Medical Association, of New York City. This is probably the first instance of a woman being elected to such a position in an association composed almost entirely of men.

Catarrh of Eleven Years' Standing Cured in Three Months.

The President of the Wisconsin State Normal School, Mr. William D. Parker, says, in a letter to Drs. Starkey & Palen, under date of Sept. 4th, 1879: "After enduring post-nasal catarrh for eleven years, at times greatly annoyed and sickened by the abundance of the secretions, in the full belief that catarrh is incurable, I procured your *Compound Oxygen*, and after three months' steady application *the secretion wholly ceased* and has not yet returned, *six months having elapsed since I have used the Oxygen.* I therefore commend your specific to the thousands of sufferers from catarrh with its attendant ills. I shall take pleasure in testifying for the benefit of any inquirers." Our Treatise on Compound Oxygen, which contains a large number of testimonials to remarkable cures, is sent free. DRS. STARKEY & PALEN, 1109 and 1111 Girard St., Philadelphia, Pa.

USE ONLY THIS THE FIRST AND THE BEST

Humorous.

"Mine poy Hans," said Snigglefritz to a friend, "is the piggesht pig dere vas in Galveston." "What did he do?" "Vell, I sends him the onder day to the groshery to pring me a pucket of peer for mineself all alone, and, py shiminy, he drinks himself almost a pint on de way home.—Galveston News.

"I WANT to find out who is the master of this house," said the man with a book under his arm to the vinegary-looking woman with a pointed nose and a very small top-knot, who opened the door for him. "Well, stranger," she said, with arms akimbo, "you just walk around into the back yard and ask a little spindle-shanked deacon you'll find there fixin' up the grape arbor, and he'll tell you if I don't boss this ranch he don't know who does. Now what do you want with me?"

The Effects of Mental Exhaustion.

Many diseases, especially those of the nervous system, are the products of daily renewed mental exhaustion. Business avocations often involve an amount of mental wear and tear very prejudicial to physical health, and the professions, if arduously pursued, are no less destructive to brain and nerve tissue. It is one of the most important attributes of Hostetter's Stomach Bitters that it compensates for this undue loss of tissue, and that it imparts new energy to the brain and nerves. The rapidity with which it renews weakened mental energy and physical vitality is remarkable, and shows that its invigorating properties are of the highest order. Besides increasing vital stamina, and counteracting the effects of mental exhaustion, this potential medicine cures and prevents fever and ague, rheumatism, chronic dyspepsia and constipation, kidney and uterine weakness and other complaints. Physcians also commend it as a medicated stimulant and remedy.

Horticultural.

NEW ROCHELLE RASPBERRY.

PETER B. MEAD.

The New Rochelle Raspberry is an undoubted seedling of the Catawissa, raised about eleven years since by Mr. S. P. Carpenter of New Rochelle, N. Y. (who also, a little later, raised the Caroline), and was first sent out in 1877, after about eight years of trial. I have grown it some three or four years. I first saw it in full bearing three years ago at Mr. Wm. S. Carpenter's of Rye, where it seemed to be perfectly at home, as do all the small fruits. Up to that time I had seen nothing in the way of a berry plant that bore such an enormous crop; and I have seen nothing since except the Snyder Blackberry, and perhaps the Caroline Raspberry, and from the latter I think I can gather more fruit, taking plant for plant. I have seen the New Rochelle since at the originator's, where it also bore a wonderful crop; and my own plants, on a much lighter soil, seem to have done about as well. It is not only very productive, but a rampant grower, and is as hardy as any wilding growing in the woods. It is propagated from the tips.

The berry is large, dark-red, covered with bloom, rather firm, with a sprightly subacid juice grateful to many, and carries well to market. Mr. C. of Rye, has realized 15 cents a quart for it. The ripe wood is a bright red, thickly covered with a fine bloom. Though not a fruit of the first quality, it might for a time hold the place of a poor man's berry, since it will grow and produce a large crop of good fruit under almost any conditions of soil and culture.

Mr. Downing and some others have noticed an imperfection in some of the pips, which they suggest may be owing to mildew. It is seen chiefly in bad seasons like the past, mostly on the late berries, and is owing to imperfect fertilization and not to mildew. It disfigures the fruit, but seems not to be otherwise hurtful.

If Mr. Williams and a few others who are not afraid of a failure, would undertake to grow a few plants of the top-rooting raspberry by a method which I have not yet tried sufficiently to warrant me to speak of it publicly, but which would seem to promise success, I will gladly explain it to them. It would save much time in proving it. My own failures have been quite as interesting and instructive to me as my successes, and would make entertaining reading.

The New Rochelle Raspberry.

The New Rochelle originated from seed of the Catawissa at Mr. S. P. Carpenters, of New Rochelle, N. Y., and was introduced to the public three or four years ago. The plant is a strong, vigorous grower, and an abundant bearer. The fruit is of the Black Cap type in habit and shape; is one-half to five-eighths of an inch in cross diameter; of a dull purplish-red color (a decidedly objectionable feature in some markets), and will bear transportation as well as the Black Caps. The quality or flavor of the fruit is only medium, and will bear no comparison with that of Brinckle's Orange, Clarke and the finer varieties of the Antwerp class.

It propagates from the tips of the canes, the same as the Black Caps. On my grounds it has shown a tendency to be affected by the fungus so destructive to the Black Caps over a wide extent of country, and the past season the fruit was also defective after the first picking, many of the pips failing to swell, or else they had been punctured by some insect and the juice extracted, causing them to dry up, thereby marring the appearance of the fruit, and virtually destroying its use for dessert or market purposes.

As a market fruit in localities like New York, where a bright, attractive color is of the utmost importance, I apprehend the New Rochelle would be a failure; yet there are localities where pleasing the eye is not so important or difficult. For instance, a friend of Westchester County, N. Y., wrote me July 19, 1880, as follows: "I am now picking my new raspberries, Caroline and New Rochelle. I commenced 21 days ago, and from appearances will pick a week or two longer. I have nearly two acres of the New Rochelle and have had an enormous crop; I contracted it at Port Chester, White Plains and Rye to parties that have had it for several years, for 15 cents per quart. The product with me is about three times as much as that of any other kind. I have discarded everything in the raspberry line but these two, and the latter is the berry of all berries for the million."

In such a locality, with such prices and heavy crops, his enthusiasm is not to be wondered at. At such prices and with a ready demand, the grower need not "care a fig" for color or flavor, a "*big crop*" shou'd be his ultimatum, and the profit would surely follow.

E. Williams.

THE NEW ROCHELLE RASPBERRY. (From Life.)—Fig. 41.

The New Rochelle Raspberry.

Of the new raspberries, after several years' trial, the New Rochelle is decidedly the finest variety I have yet tested, and I believe I have had nearly every kind that has been offered for trial. I have now two acres, of the New Rochelle which fruited the past season. The yield was very large; the entire crop was sold at the villages within three or four miles, at 15 cents per quart. I think this variety will yield three times as much as any other kind in cultivation except the Caroline. This is a very promising new variety. It is thought by good judges to be about as good as Brinckle's Orange. It is wonderfully productive, and, being entirely hardy, will make a most valuable addition to our list of hardy raspberries. It is not as firm as the New Rochelle, and consequently will not bear long shipment. The berry is very large and of a fine orange color.

Wm. S. Carpenter.

Rye, N. Y.

Mr. Charles Downing, in reply to our inquiry, states as follows:

"The New Rochelle Raspberry is very promising and worthy of cultivation."

RURALISMS.

On page nine, a correspondent suggests that the statement in regard to the yield of the Blount Corn in connection with flat culture, would have been more satisfactory if the editor had earthed up half the lot, and given the result. It would certainly have been interesting and instructive, but it is a mistake to suppose that such experiments have never been made. I am able to say, of my own knowledge, that they have been made a number of times by careful and intelligent farmers, and particularly by one who had, at the time, the reputation of being the model farmer of his county, and famed for his golden butter. At my suggestion he grew about half his corn crop on the flat system, while the other half was earthed up in the usual way. The season proved to be a dry one, and the difference between the two was so great as to be observed from the roadside. I could mention a number of other cases where the two methods have been carefully compared; and it is not many months since a correspondent of a Western horticultural journal stated that he and his hired man made an experiment in flat culture at the suggestion of the latter (the employer evidently supposing the method to be quite new) and this correspondent candidly admitted that

"his hired man beat him." I have myself repeatedly made the experiment, not only with corn, but with all the field and garden crops usually earthed up, and the result has always been in favor of flat culture. The difference in favor of flat culture has always been greatest in a dry season, and for obvious reasons. Besides, a crop is produced at less expense in this way, and this is a very important point, even if there were no material gain in the crop. I repeated these experiments yearly for some five years before I began to talk much about them. A single year's trial might convince the experimenter in such matters, but would hardly satisfy the farming community.

WHILE on the subject, I will say that, so far as I know, the late Judge Buell, when he edited the Cultivator, before it was merged into the Country Gentleman, was the first to bring to public notice and advocate the advantages of this method, as being peculiarly adapted to our country and climate, and I have always called him the "father of flat culture," which now has not a few followers. It is a system that should be more generally considered by Western farmers who have no home market, and who should naturally wish to produce large crops at the least expense. As for myself, I have not for at least thirty years earthed up any plants except those that I wish to blanch. I cannot afford to do it.

A LADY of St. Louis having asked me by letter for information in regard to the Epiphyllum, or Crab's-claw Cactus, as she calls it, it may be useful to ladies elsewhere if I state here that there are few finer winter-blooming plants for room culture than Epiphyllum truncatum and its varieties. They are but very little trouble at any time, are easily grown, and bloom when quite small. They are charming also in the greenhouse and conservatory. I have upwards of twenty kinds; and coming into flower, as they do, at different times, I have a succession of beautiful flowers from November till March; and yet people are advised to dry them up during the Winter. I advise the readers of the RURAL to grow Epiphyllums, and to water them very much as they would any other plant, especially when they begin to show bud.

A YOUTHFUL correspondent in another part of the RURAL said, with evident pleasure and surprise, that her cleander produced seed last Summer, and wanted to know if that is a rare thing. The question shows an observing mind, and is promising for the future. I judge from her letter that this little girl is animated by the right spirit, and I would like to send her some seeds for her garden next Summer. It is just such cases that the RURAL should speak encouragingly to. They are small, but the future is all before them; and it is a great thing to have the privilege of giving a right direction to a child's mind, even in horticulture. I read with pleasure the letters of the little ones to Uncle Mark.

Experience with Peas.

I have been busy to-day gathering pea brush. I used to think it did not pay to brush peas; but I have since found that nothing pays better where brush can be had. Aside from the increased yield, which is at least one-third, it is only about one-half as much work to pick brushed peas. They are also ready to pick about four days earlier than those grown upon the ground. I make the same brush last three years. As soon as the peas are harvested, I pack the brush away under cover where it remains until another season. This year I raised about 75 bushels of peas in the pod from one and one quarter bushel of seed. I planted half a bushel of Alpha, half a bushel of Champion of England, and a quarter of a bushel of McLean's Advancer. The Advancers did poorly; I shall not try them again. I think the Alpha for an early pea is about right. I plant as early in the Spring as I can work the ground. It being a deep sandy loam, I am not particular about its being very dry. I put the seed in about five or six inches deep, usually sowing a little phosphate in the row before I sow the peas, the ground having been well enriched for celery the year previous. The Alpha I plant in rows about four feet apart, and the Champion five, taking care to have the rows as long and straight as possible, so that they may be cultivated with a horse. With me the Alphas require brush from three to four feet high, and the Champions, from five to six. I cultivate them twice, once just before I set the brush, and once pretty soon after. I don't think they should be cultivated after they commence to blossom, unless it be to give them a very shallow hoeing. Having read in the RURAL, or some agricultural paper, that early peas would sometimes make a good crop if planted the first week in August, I tried the experiment with four quarts of Alpha, and although the weather was favorable, the crop was very light, most of the pods having only one or two peas in them. I have come to the conclusion that peas cannot be profitably grown when planted later than the first day of June. Peas brought, on an average, $1 20 per bushel during the past season.

Arboricultural.

THE PRESERVATION OF OUR FORESTS.

BY CLINTON.

I WAS highly pleased to notice, in the recent Report of the Secretary of the Interior, that he takes decided ground in favor of the adoption of measures for the preservation of our timber. His suggestions are timely, and it is to be hoped that they will not be permitted to pass entirely unheeded. The subject is one which, it would seem, cannot by any possibility be construed into one of a partisan character, and I disclaim any intention of considering it in any such light in my present remarks. It is a matter which for years has attracted my attention, and with reference to which it has seemed to me important that our government should not be indifferent, but should at least endeavor to devise more energetic and effectual measures than any which have been adopted; and for years I have availed myself of opportunities to call public attention to its importance and to the necessity of prompt action if we have any desire for the future welfare of our country. But the public attention has seemed too wholly engrossed by matters promising more immediate results and profits, to give heed to any matter apparently so remote in its results as people seem to deem this to be.

It is therefore specially gratifying that an officer of our general government should call the attention of Congress directly to the subject, and urge upon that branch of the government the importance of giving it immediate attention. He says, in substance, "Our forests are disappearing with appalling rapidity, especially in that part of the country where they will not renew themselves when once indiscriminately destroyed. Like spendthrifts, we are living, not merely upon the interest, but upon the capital. The consequences will be inevitably disastrous, unless the Congress of the United States soon wakes up to the greatness of the danger and puts this ruinous business upon a different footing by proper legislation." The Secretary does not speak in language one particle too strong or emphatic, as any one will see who gives attention to the subject. But the difficulty is to induce our people to give attention to and examine this subject. No intelligent person who will do that can fail to see that our American forests are disappearing with a rapidity which is unnoticed, and not even *dreamed* of by a majority of the people. But to one who has given the matter any attention or study the subject presents a view which, as the Secretary says, is truly "appalling." To the agriculturist, particularly, this subject is one of deep interest, and for that reason, it is thought, its consideration cannot be deemed out of place in the columns of the RURAL. The climatic and sheltering influences of forests, not only on vegetation, but on the health and comfort of mankind and the animal kingdom generally, are too well known to require any discussion here. We find that the normal condition of our portion of this continent was that of a *wooded* country; its forests, with comparatively few exceptions, stretched from the Atlantic coast to the Mississippi River, from the great lakes on the north to the Gulf on the south.

Probably no people have ever surpassed, if they have even *equaled*, its first settlers and their descendants in boldness of enterprise and in active industry. They have, within comparatively a brief period, leveled the forests and let in the sunlight on many thousands of square miles of territory. They have built cities, established churches and seminaries of learning, have opened canals, have constructed railroads, have built a navy, and have become, in reality, a powerful and prosperous people. But unfortunately their enterprise has not always been sufficiently discriminating. The original necessity for sweeping off the forests imparted to too many a propensity for cutting and slashing, which did not stop within reasonable bounds, and which, I fear, still continues. The rapid disappearance of our forests should therefore excite the serious attention, not only of the owners of cultivated lands, but also of other classes generally, for it is a matter in which all of our citizens are more or less interested. The observing man can now readily see, in passing through the country, with what improvidence and seeming want of thought the first settlers conducted their operations.

In their haste to get their lands under cultivation they girdled or burned large tracts of magnificent forests, seemingly without any thought beyond the immediate present—certainly too often without any intelligent, definite plan for the future. With no reference whatever to the general beauty and health of the country, and even without any reference to their own future interest and comfort in leaving sufficient protection, in belts of standing timber, to shield their houses and crops from the sweeping blasts of Winter, the work of destruction went inconsiderately on, while, with a little proper consultation and understanding among neighbors and intelligent concert of action with reference to some general plan, the advantages to which I refer might have been easily and permanently secured. It was too frequently found, when too late, that the reserved wood lot was on the wrong side of the clearing to furnish any perceptible protection to the buildings or cultivated fields, while the house and farm buildings proved to be located in the most exposed and bleak situations, involving, consequently, an increased consumption of fuel, food and fodder. After one or two generations have passed away the error becomes palpably apparent, and a score or two of years are found necessary for the growth of trees planted with a hope to supply in some small degree the shelter that had been so injudiciously destroyed.

But, independent of the havoc and waste of timber by the early settlers, other causes always have been, and still are, in constant operation to diminish the supply, and the consumption of timber seems to be constantly increasing, while the supply is rapidly diminishing. Among the causes constantly operating to lessen our supply are: First, the constant and necessary demands of wood for fuel. Notwithstanding the general use of coal for fuel in cities and populous places, yet a certain amount of wood is found necessary even there, while a large majority of the population of country places is composed of farmers' families depending almost entirely on wood for fuel, and who will, while the supply lasts, continue to use it with great freedom. Second, in the increased demand for lumber for building purposes. This includes not only what is necessary for the erection and finishing of buildings, but also what is used in the construction of fences, railroads, bridges, etc., and what has been and is constantly being used for the building up of our navy and the keeping of it in repair. Third, the consumption of timber for purposes of mechanical industry. This includes furniture of every description, carriages and vehicles of all sorts, whether for rail or other roads, farm implements generally, important parts of mechanics' tools and of machinery in general, besides the supply for the cooper, the trunk and the box manufacturer, and some thirty other classes of operatives, depending wholly or in part upon lumber or wood as an essential part of their material for work.

Fourth, and the last I will stop to particularize, is the amount of lumber exported to other countries, which is a constant drain upon the resources of our forests. The most valuable oak and pine trees are generally selected for this purpose. Not only the quantity actually *used* should be taken into the account, but also the quantity *wasted* and destroyed in the selection and preparation. In the selections for all these various uses the most valuable of our timbers are sought, as already stated, including more than thirty varieties, and the quantity of waste to which I refer, far exceeds anything of which the uninformed have any conception. In consequence of all this destruction of our timber, careful estimates, made by those competent to do the work, go to show that it is certain that *three millions of acres* of our forests are swept off in each year to supply the various demands, or 10,000 acres for each working day. Is not the Secretary justified in his assertion that the rapid destruction of our forests is truly appalling? Moreover, in addition to this great intentional destruction of our forests, thousands of acres are annually destroyed by fires, started either by the carelessness of man or by lightning.

But I find I am exceeding the limits I first proposed for myself, and have only attempted to call attention to the danger that threatens us, without proposing any methods of averting or retarding the progress of that danger, as I originally intended to do. But that branch of the subject must be deferred till a later opportunity.

How to Grow Telegraph Poles.

This is a very simple operation, and as there is a growing demand for them, they might as well be grown properly and economically. A tree planted out by itself, having nothing to interfere with its natural growth, will spread out its arms at will. Trees planted in close rows, and closely in the row, become cramped for room sideways and shoot upward as straight as an arrow, and the lower limbs are soon overshadowed by the tops and die off, leaving the trunks bare and all the branches growing nearly upright. The dense tops shade the ground so as to prevent the growth of grass and weeds, the roots are never scorched by the sun's heat, because it cannot reach them. The same tall, straight, bean-pole style would result from a course of persistent pruning, but that is labor, while close planting saves all labor, and produces an enormous crop on a small surface.

The top of a tree is very nearly the shape, spread and character of the roots, if the soil is not so hide-bound as to cramp them. Trees grown singly spread their roots out as far as their branches, but when grown closely they have no room to spread, and, finding food scarce, descend into the lower depths, exactly as the tops ascend into the atmosphere above.

Plowing corn deeply in a dry season "drives the roots downward to seek food," by this species of root-pruning, or root crowding, or whatever it may be called.

If, by the above, I have answered a query of an editor, inserted in my article in the January Corn Number, and shown how to grow poles, too, I have killed two birds with one stone. S. RUFUS MASON.

[Thanks to Mr. Mason for his answer. We would remark that the extent to which the roots of annual plants are driven down by cutting off the lateral roots is a subject worthy of experiments. We would suggest that a grain of corn be planted in a bottomless keg sunk in the earth.—EDS.]

Pomological.

APPLES FOR PROFIT.

E. P. POWELL.

IT would be impossible to give a list of apples, that would apply for either quality or profit to all parts of the country; but a few varieties may be specified that will generally give satisfaction through the Northern States.

Premise that no early apples pay to raise for market except the very early, and it will narrow our list of profitable early varieties to Red Astrachan and Harvest Bough. It is possible that special seasons may render September apples worth the picking, but this is unfrequent. Every one needs for home use the Porter and Gravenstein, as well as Early Rose, Summer Queen and a few more; but not for market. Passing to Winter fruits we have for

Early Winter Apples.

1. BELMONT, a noble apple in quality and most abundant in bearing. The tree is naturally well spread and capable of sustaining an enormous crop. This is sometimes called the Waxen Apple.

2. SNOW, a handsome fruit of superior quality, that keeps well till April, although it is prime for table use in early December.

3 HUBBARDSTON NONSUCH, a very large, finely-colored, agreeable apple that will not keep well beyond December. Old trees, like most that bear heavily, become quite brittle.

4. POUND SWEET. This apple pays better at one dollar per barrel than most varieties at two dollars. The fruit is so large and the trees so low-growing that four barrels are filled while one is gathering a bushel of many other kinds. The crop is always extraordinary and reliable, on alternate years.

5. BALDWIN. If the trees did not split and break so readily, this would be almost unrivaled as a good market variety.

6. R. I. GREENING. Here is another naturally low-growing, spreading tree, easily handled and bearing nobly.

7. JONATHAN, a remarkably fine, handsome apple and very prolific, although small. It is very salable and sure to grow in popular estimation.

8. GRIMES'S GOLDEN. This is perhaps the most profitable of the pippins over a wide range of territory, although the Newtown is unrivaled in some localities, and the White Pippin in my own orchard is superb in size, color and bearing.

9. NORTHERN SPY. Taking ten years successively, the profit of an orchard will be found to depend mainly on the long keepers. The cultivator can store such safely until he is sure of a good market in May. The Spy is in every way a wonderful apple. It is a superior bearer, superb in quality and in appearance.

10. KIRKLAND. This apple is but little known, and has one decided disadvantage—its color is yellow. But it keeps well, even longer than the Spy. The trees bear every year and on alternate years the crop is enormous. They are remarkably tough, never breaking down with their burden. I sold my Kirklands in May, 1880, for $1.56 per bushel.

The chief secret in making profit from an orchard lies in the careful handling of the fruit. Apples must be handled with sympathy and as lightly as eggs. They should never be tossed or dropped a single inch; nor poured. A little more care during picking, and there will be less labor and loss afterward. The average loss on apples, as ordinarily gathered, is one-half. This is a useless and reckless waste. No crop gets as little proper attention. The speculator hires raw hands who thrash, and toss, and tumble about the tender fruit, and then, without intelligent sorting, pack it to swindled purchasers.

Another serious evil in raising apples for

profit, is the habit of planting trees too closely together. An apple picked from a dense orchard is a wholly different thing from an apple that has had its share of sunshine and good air. Try the Greening as an example; in one case a "greening" clear through, in the other it is golden in flesh and almost unrivaled in flavor. A well grown and well ripened apple is also a better keeper.

To the above list of tree varieties for Winter might be very well added the Roxbury Russet, which, however, fails to be profitable on old trees; the Ben Davis, which is both productive and handsome, and Peck's Pleasant. These are valuable in all sections of the North. With the two Summer varieties we thus get fifteen first-rate market varieties, or they may be reduced to ten.

Oneida Co., N. Y.

NOTICES OF PEACHES
FROM NOTES TAKEN AT MATURITY.

T. T. LYON.

SERRATE EARLY YORK.—Forty years ago this was a popular garden fruit, largely, no doubt, for the reason that it was at that time the earliest good peach. Notwithstanding its liability, in common with serrate varieties generally, to the influence of mildew, it may be said to have held this position till it came to be supplanted by Hale's Early, since the introduction of which it has been in a great degree ignored and forgotten in consequence of its relative lateness and comparative unproductiveness.

EARLY TILLOTSON, another serrate variety, came before the public about 1845 to '50, with quite a flourish of trumpets, and was alleged to be earlier than Serrate Early York, and likely to supplant it; but it soon showed itself even more subject to mildew than its predecessor, proving nearly, or quite, valueless at the North, although farther South it seems fairly successful. I was amused at receiving this from my friend, L. E. Berckmans, of Georgia, in response to a request for specimen trees of such Southern varieties as would be worthy of trial at the North.

COLE'S EARLY, HAINES'S EARLY AND LARGE EARLY YORK seem also to have, to a considerable extent, lost their hold upon the partiality of planters and are now but little called for. They are quite similar in season, as well as in general qualities. Indeed, Mr. Downing seems to doubt the right of the latter two to be regarded as distinct varieties.

TROTH'S EARLY RED, a New Jersey market peach, has the merits of productiveness and good handling qualities; but it is deficient in juice, flavor and richness, besides which it is a pale-fleshed peach, which alone renders it less popular in the market, especially at the West.

MOUNTAIN ROSE is a comparatively recent introduction, which, doubtless on account of its bright color and the vigor and productiveness of the tree, is becoming popular. Coming in with several of the foregoing, and with little to commend it beyond others of similar season, it will be to me surprising if it shall long maintain a high position among planters.

BARNARD, sometimes called Early Barnard, or Barnard's Early, is thought by Mr. Downing to be identical with Yellow Alberge; or otherwise a seedling from it, with too slight a variation to entitle it to distinct recognition. However this may prove, the variety, at one time, in the estimation of Michigan market planters, occupied the post of honor. For the past four or five years, however, it has been steadily losing prestige here, till at the present time it stands as low as fifth or sixth in the list of popular sorts. It was never worthy of such eminence; hence I hail the change as an indication that education is doing a legitimate work upon both the consumers of fruit and the planters of trees.

SNOW'S ORANGE originated in Van Buren Co., Michigan, doubtless from seed of the Barnard, which it very closely resembles, although it is a little brighter in color, and by many alleged to be slightly later in ripening. As is the case with several other varieties, the Barnard seems occasionally, if not even generally, to reproduce itself from seed. In fact, this is the most probable explanation of the fact that differences exist in the fruit as grown upon different trees. Snow's Orange has glands very distinctly reniform; while those of the Barnard are very obscurely such. Both varieties ripen with Early Crawford.

WHITE IMPERIAL, which originated in Central New York forty or fifty years ago, possesses most of the qualities required in a market peach, excepting, perhaps, that it lacks color. It is, in fact, decidedly superior in quality to market peaches in general, while it is abundantly productive and of fine size. It is especially desirable for culinary uses generally, including canning, preserving and drying. For these purposes, it should find a place in every garden. Ripe in September.

WINTER CRAB APPLES.

IN reply to a correspondent the RURAL says, referring to a specimen crab apple:

"We have seen specimens of Hyslop, Meader's Winter and Lady Elgin as large and handsome, but as to the average merits of the various sorts, as compared with this, we cannot, of course, say anything."

I have long grown the three varieties here referred to, and my judgment regarding them is as follows:—

HYSLOP; of good size (one and a half to two inches in diameter) and great beauty, but not strictly a Winter fruit. It rarely keeps beyond the middle of December. Quality fair for cooking or preserving. The tree is worth more for ornament than fruit. It is a fine, symmetrical grower, with remarkably large and fragrant blossoms, and the fruit is glorious to look at.

LADY ELGIN.—Smaller than Hyslop, yellow, with a red cheek. Quality, as regards flavor, very good, but it never becomes really mellow. It keeps better than Hyslop, and is a better canning or preserving fruit, though not so high-colored.

MEADER'S WINTER.—This is a true Winter apple, keeping well through March. Size about the same as Hyslop; color yellow, nearly overspread with dark red. Quality not inferior to a Baldwin, and something like it. Tree thrifty and productive. Decidedly the best Winter crab I have. T. H. HOSKINS M. D.

Orleans Co., Vt.

Ice-Coated Fruit-Trees.

ONE of the wrong ideas which has a very general lodgment among the opinions and beliefs of orchardists, and which keeps its place in the face of all the flood of light that the press is now throwing upon all the theory and practice of the farm, is that of supposing that a coating of ice or of hoar-frost on the branches and twigs of trees is destructive to them or to their fruit-buds. It is, on the contrary, preservative, unless its weight is so great as to cause breakage. Hoar frost is dew, freezing, crystallizing as it condenses; and whenever it occurs the air is warmer than the objects which receive the condensation, and is at the same time saturated with moisture which it deposits on cooler surfaces. Now, plants in general, enjoy moist air, and dryness of the air is by far the most frequent cause of their death; and it is when the sky is dry and clear that heat radiates freely from every surface into space, and during the long clear nights of Winter very much more heat is lost than the short days and dim sunshine enable plants, etc., to absorb. Blasts from colder districts are dry as well as cold, and attack the life of plants by both weapons.

TYRONE.

EXTRA-HARDY APPLES.—Referring to the list of apples under the above caption, taken from our catalogue, we are now satisfied that the Rubicon should be dropped from this list. It does not prove as hardy as anticipated. We also have a new early variety to add to the list—Yellow Transparent. This apple, of Russian origin, has been tested in Vermont, and, like all of its class, the tree is very hardy and comes into bearing very young. The fruit is in size medium to large, of a fine, rich yellow color; flesh, fine-grained, juicy, rich, sub-acid. It ripens ten days to two weeks earlier than Early Harvest and Tetofsky, and is undoubtedly a valuable addition to our list of early apples.

Geneva, N. Y. R. G. CHASE.

Floricultural.

THE PETUNIA.

THIS old, well-known annual still holds its place among the favorites of the flower garden, and is well adapted to our climate. The petunia is much used in Europe in decoration, and, indeed, is one of the finest winter-flowering window plants. It has many just claims to holding a prominent place among the choicest bedding and pot plants, some of these being its very plentiful formation of seed; the comparative certainty with which the seed germinates; the long continuance of the flowering period, which, out-of-doors, extends until frost comes; its endurance of dry weather, and the little care that is required for its cultivation.

PETUNIA HYBRIDA FLORE-PLENO.—FIG. 43.

A new variety, which has just been introduced by Mr. B. S. Williams, of London, is Petunia hybrida robusta flore-pleno. The plants of this novelty are very compact and of symmetrical growth, and attain a diameter of 14 inches by about 11 inches in hight. The flowers, of which a large number belong both to the smooth and the fringed-petaled, large-flowering, double sections, comprise the whole of the beautiful shades of color, and so freely are they produced that a fully developed plant has all the semblance of an artificially made bouquet. This is a robust race of petunias, and will, from its convenient hight, be found especially suited for the open ground. It is, however, admirably adapted for pot-culture.

BLEEDING HEART.—Here is a seasonable item of value to those who like flowers for their windows. As soon as our January thaw comes (I believe Mr. Vennor has promised one) go into the garden, if you can find it under the besetting snow-drifts, and with a spade dig up, with plenty of earth adhering, a bush of the Dicentra spectabilis or Bleeding Heart, as it is sometimes called; plant it in a box or pot; set it in the sun-light in the living-room; give it water, and within a few weeks it will break out in beautiful flowers. It is an old-fashioned plant, so old-fashioned that some folks won't have it in their garden, but old-fashioned people can so brighten up their windows with this that it will make them the envy of some of their neighbors. G. S. W.

Rochester, N. Y.

Rural Architecture.

HAY BARNS.

W. G., West Troy, N. Y., asks for a plan for a hay barn, to be about 30 by 60 feet, with 22-feet posts and vertical sides, arranged for horse-fork and hay-carrier. Some of his neighbors who intend building such barns are also waiting for hints through the RURAL.

ANSWER BY PROFESSOR I. P. ROBERTS.

It is impossible to construct so large a building as W. G. wants, without moderately larges-ized timbers. The pressure of hay is not only to be provided for, but the building must be strong enough to resist the winds. As he intimates that several want similar plans, I suggest that they club together and employ an experienced architect to draw a plan, which may be modified to suit all parties; for it is impossible to give anything more than general suggestions in a short newspaper article.

The sills, if laid on a wall, may be 4x8 inches; if on piers, 7x7 inches, with posts and beams of the same size, except the intermediate side posts, as at I, which may be 4x7. It will readily be seen that the intermediate side posts are used in order that the side timbers may be reduced in size and shortened one-half in length. One entire belt of girts—fig. 45—should be tenoned and pinned. They may be of 5x6 timber placed flatwise. The nailing girts, just above and below the belt girt, and the braces may be of 2x5, *all* spiked in—the braces first and the girts afterwards—thus making one help the other, as shown at E. The building may be further strengthened by spiking short braces across the corners of the sill, as shown at *b*. To prevent it from spreading, braces should be thrown across the corners from plate to beam and secured by bolts, as at *a*. It is far better to secure braces by bolts where there is much strain, or by spikes where there is little, than by the old and expensive method of mortising, which frequently seriously weakens the timbers. By using 3x4 plate-beam braces and framing the top of the beam three inches lower than the bottom of the plate, the top side of the brace will coincide with the bottom of the plate, and the bottom side with the top of the beam—see end of braces *a*, *a* in fig. 44.

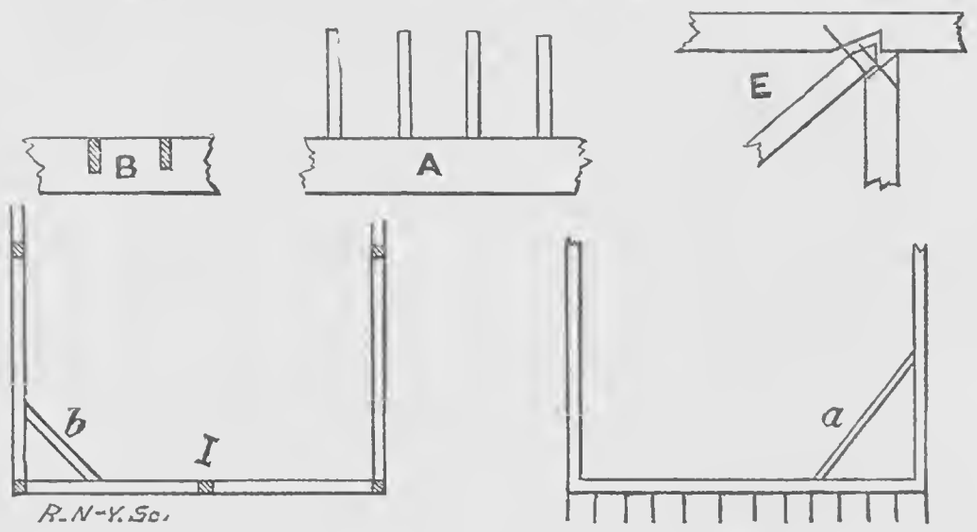

FIG. 42.

The floor should be 12 feet wide if it is proposed to drive through the barn; if not, then it should be at least 14 feet. The floor joists should run across the floor; this brings the floor planks so as to drive on them lengthwise. The sills should *not* be "gained," as shown in in the small section, B, but the construction should be as shown at A, as this preserves *all* the strength of both sill and joist.

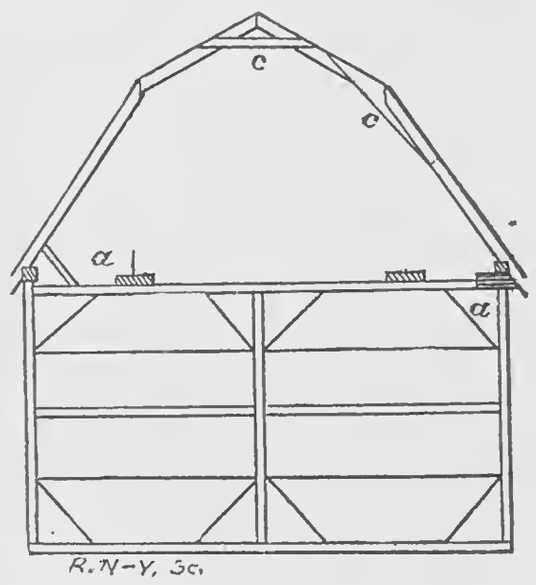

FIG. 44.

Lastly comes the roof, the most difficult and expensive part of the building. The self-supporting roof, as shown at fig. 44, is becoming quite common in this locality. I have had no experience in constructing a roof of this sort, but I have examined several, and they have every appearance of being both strong and durable. There are several things to be gained by this mode of construction. The expense and annoyance of all roof supports are avoided; the posts may be shortened and yet the capacity of the building be preserved. It stands the wind better, because it presents less perpendicular surface. It removes much of the thrust of the roof on the plates by the steep pitch of the rafters. Strength is gained, because it approaches very nearly to the form of an arch. There is said to be a patent on this roof, though I doubt if it can be maintained, as the

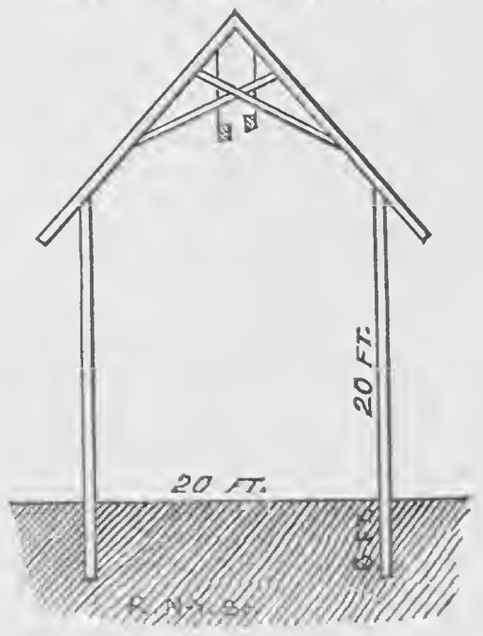

FIG. 45.

principle has been used in the construction of domes and arched-roofed churches from time immemorial. If light timber is used in the frame, the ends of all beams should be secured by an iron stirrup, as shown at *c*. The rafters should be 2x5 inches, placed two feet apart, and they should rise about 12 feet perpendicularly to every eight feet they depart from it, as shown in fig. 44, which represents a building 60x32 feet, with posts 18 feet. If the building is placed two feet from the ground, it will give an available space to *c*, which would be 32 feet from the ground. To secure the rafters and give strength, triangular boards should be securely nailed on both sides of them at *c c*. A practical carpenter—with a head on him—might, I think, construct a building of this size and use timbers only 6x6 inches, by mismatching the girts and beams so that no two mortises pierce the post at the same hight, and by using a little ingenuity in bracing and preserving the strength of the timbers.

But if these buildings are to be used only for *storing hay*, why not build a far cheaper and almost equally good structure (for the purpose designed), the hay barrack—see fig. 45. I have discarded all horse-hay forks for the *hay sling*, which not only unloads long hay, but short oats, barley, corn-stalks and wheat, bound or unbound. A load of 3,000 pounds can be deposited in the mow with four slings, in an average of less than ten minutes. I consider

the hay sling as far in advance of the horse-fork as the horse-fork is in advance of the hand-fork.

Cornell University, Ithaca, N. Y.

The Herdsman.

IN-AND-IN BREEDING AS EXEMPLIFIED IN THE DUCHESS SHORT-HORNS.

JONATHAN TALCOTT.

In asking "Stockman," in the RURAL of December 18, to give the number of animals of the Bates Duchess family now in existence, in order that farmers might judge of the theory of in-and-in breeding as advocated by him, my desire was for information, and I had no idea that he would take the course he has taken in order to avoid an answer; for, either through prejudice or ignorance on my part, I can look at his replies in no other light than as shifts to avoid a direct answer in one way or another. I did not ask in how many herds of cattle was the blood of the Duchess tribe of Short-horns intermingled, but how many and where are the descendants of Duchess of 1804, also of Duchess 1st, purchased as a two-year-old at Mr. Charles Colling's sale of cattle in 1810. Mr. Bates bred them in-and-in all he thought best, no doubt; and if that is a successful method of breeding, there should be thousands of that family to-day in England and America. But if that is not a successful method of breeding, the breeders of to-day should know it.

At Mr. Thomas Bates's sale in 1850—40 years after he had purchased the two-year-old heifer at Mr. Colling's sale—there were *eight* females sold of the Duchess family and six males. These were all descendants of Duchess 1st, purchased at C. Colling's sale as a two-year-old in 1810. Ketton the 1st is the only animal noticed in Bell's History of Improved Short horn Cattle as descended from the Duchess of 1804. If there was any breeding cow or heifer of the Duchess family sold by Mr. Bates during his life, I wish "Stockman" would tell the readers of the RURAL NEW-YORKER when it, or they, were sold, and to whom. I do not know of any one having been sold by Mr. Bates to any other breeder during his life; if not, then certainly the number at the sale was very small for 40 years' breeding of the Duchess family. Mr. Bates himself resorted to some out-crosses in his life, in Norfolk (2,377) and Belvedere (1,706); the first bred by Mr. Whittaker and the second by Mr. Stephenson. The last-named bull gave the Duchess family by his get on them their greatest excellence, and the great mistake of Mr. Bates was in not selling the Duke of Northumberland (1,940) to some other breeder, to whom his services no doubt would have been of great value on other herds not in-bred, and in not having kept Belvedere as long as he was useful as a sire. He was the sire of the best animals Mr. Bates ever bred, while the Duke of Northumberland, from his near relationship to Mr. Bates's herd, was of little value to him as a sire.

Suppose we look after the Bates Duchess family now, and see whether they are as numerous as "Stockman" intimates. I say "intimates," because he does not tell where any of them are to be found, but says, of the Duchess blood, "It is not confined to the central concentrated receptacles, the numerous Dukes of this and Duchesses of that, that may be pointed out wherever Short-horn breeding is carried on; but it spreads everywhere."

At the New York Mills sale, September 10th, 1873, of the 13 Duchesses from these females, that were sold, eight were kept in the United States, and if in-and-in breeding is the true course to be pursued in the raising of healthy and prolific breeders, there should now be a numerous progeny as descendants of those females; if not, why not? They were purchased at extravagant prices, and no doubt all the proper care was exercised toward them that our breeders of Short-horns know so well fine cattle require. Of these Duchesses one living animal now remains, the 10th Duchess of Oneida. Never having bred, she is at her purchaser's, Mr. Alexander's, in Kentucky. The bulls sold at that sale are all dead except the 7th Duke of Oneida. He is also owned by Mr. Alexander. The 7th Duke has a Booth and Knightley cross. The writer saw them both in 1875 while visiting at Mr. Alexander's in the Fall of that year. The Dukes and Duchesses sold at that sale and retained in America cost the purchasers nearly $160,000. Have the purchasers got, or did they ever have, the value of their money in those Dukes and Duchesses purchased at that sale? I think they did not; but they did help to inflate a bubble which has burst, and no doubt some of them have seen the folly of chasing a shadow where the substance is wanting.

The Airdrie branch of the Duchess family has a Booth out-cross, which many breeders feign to despise. There are a few members of this branch, but they are not considered the aristocracy of the Short-horn race. If, however, as is extremely probable, the Bates Duchess tribe shall soon become extinct in the United States, the Airdrie branch may thenceforth step to the head, and take a higher rank than heretofore.

Suppose we look at the Duchesses in England and see what is to be seen of them in their native home. The herd of Col. Gunter has been, I believe, considered one of the best, if not the best, in England. He made his first purchases at the sale of Earl Ducie's herd on August 24th 1853, buying two females of the Bates' Duchess family. In a late visit to the herd by G. E. M., as published in the National Live Stock Journal, he says there were five Duchesses and two bulls; four of the Duchesses he saw and both the bulls, together with two Short-horn bulls that did not belong to the Duchess family. He went with conscious prejudice in their favor, but he was disappointed. He says: "The average merit as individuals of the six members of the family seen is fair, but that is all. No one of them would be selected as an especially good Short-horn; no one is an especially poor Short-horn. Neither of the bulls is as good as either of the two not Dukes. No one of the females would be put anywhere near the top of the herd. These seem the simple facts, judging without regard to pedigree."

Now I wish to ask "Stockman" where, if any, is the encouragement for the breeders of the present day to follow in and-in breeding by the example of Mr. Bates with his Duchess family, as shown in this letter. If, however, I have erred in the statements made, will he please to show wherein the error, or errors, consist. I have endeavored to be candid and to give a correct statement; if I have not done so, the misstatement is not intentional on my part. If "Stockman" wishes to accuse me of being prejudiced, I shall not deny the accusation, but simply claim that all mankind are subject to the failing.

In regard to the Bates families of cattle, so-called, I freely admit that I have been strongly in their favor, and had I had the wealth of some of the earliest importers of Short-horns, I should have purchased of Mr. Bates and brought to America a Duke and Duchess long before his death, if he would have sold them to me, and, with a different course of breeding, that family might now have been healthy and prolific breeders. I am not vain enough to think that I should have done any better than other breeders have done, but the bull in those early days would have been valuable on what is called plainer-bred Short-horns. There is no doubt but the long-continued in-breeding has deteriorated the bulls of that family as sires very much more than many Short-horn breeders will admit. Had Mr. Bates combined the Duchess with the Old Daisy and Princess families—as at his commencement in 1810 he might have done—and then added the Matchem Cow afterwards, as he did, he would doubtless have added greatly to the good he did the public in his career as a breeder of Short-horns, and at his death have left a herd of vastly more real value than was the case, from their increased hardihood and greater fecundity.

Rome, N. Y.

NOTES BY A STOCKMAN.

Your very intelligent contributor, Mr. W. I. Chamberlain, of Ohio, has already done excellent work in his office as Secretary of the Ohio State Board of Agriculture. His report is the most useful document of the kind I have ever read and is worthy of careful study. Those parts of the report which may be pertinently mentioned in these notes are those which refer to the sheep interest of Ohio and to the losses by diseases of cattle. In 1876, Ohio produced 24,844 601 pounds of wool from 7,622,495 sheep, but in 1879, only 18,671,427 pounds of wool from 4 267 261 sheep. Two things are noteworthy here—the decrease in sheep and the increase in the weight of fleece per sheep. Ohio has lost 40 per cent. of her sheep, and has raised the average weight of the fleece from a little over three pounds each to nearly 4½ pounds. This increase in fleece is doubtless due to the more general use of pure-bred rams. But what is the cause of the loss of sheep?

Dogs!—There is enough to every sheep owner in that one word to make this note complete without another.

I maintain that no other farm stock will pay so well as a flock well chosen and well kept. But here in Ohio, which is eminently a dairy and a sheep State, 28,700 sheep were injured and 23 629 were killed by dogs in 1879, with a money loss of nearly $140,000. The loss to the State by the prevention of a profitable business may be readily estimated at $16,000,000; for the increase which has occurred in the dairy and in wheat and corn-growing might reasonably have happened with the sheep, and instead of eighteen million pounds of wool being produced, there might have been nearly fifty millions and much mutton and lamb besides. And all this loss is chargeable to the dogs.

But what are you going to do about it? To complain seems to be like "the voice of one crying in the wilderness." To put the loss in figures, as has been done in this report, and to keep pegging away at the subject, are about all that can be done in the matter.

Page 52 of the report aforesaid is a melancholy exhibit. Permit me to give the figures as follows:

ANIMALS DIED FROM DISEASES IN 1879.

		Value.
Hogs	152,590	$544,032 50
Sheep	59,440	179,613 50
Cattle	18,816	360 384 00
Horses	10,074	677,198 00
Total	240,920	$1,761,228 00

Here is a self-inflicted tax of enormous amount levied upon agriculture in one State, and that one of the least suffering in this respect. Brought up on a farm and a farmer for 25 years, I have never yet had any animal larger than a hen die from disease, and this exemption from loss has been due to constant care. I venture to assert that 75 per cent. of all the losses which occur throughout the country might be prevented, if only the owners would learn how to exercise common sanitary precautions, and knowing how, would use the requisite care and caution to prevent them.

The more we know of diseases of animals, the more we know that they are caused by want of the commonest sanitary precautions—by neglect and filth, in fact; and they are, therefore, avoidable.

Another valuable contribution to agricultural knowledge is the report of the Commissioner of Agriculture, Hon. Wm. G. De Due, for 1879. This contains an exhaustive report on the contagious diseases of the domestic animals, elaborately and beautifully illustrated, and which is of the utmost value to every stock owner. This report will fully bear me out in the above judgment as to the possibility of avoiding these destructive diseases, for the numerous examples given of the arrest of disease, as well as of the spread of it, by care on the one hand and by neglect on the other, completely sustain this view.

When in one State a million and three quarters of dollars' worth of stock die of disease in a year, there ought to be a great field for the employment of veterinary surgeons. And yet this field is at present almost wholly unoccupied.

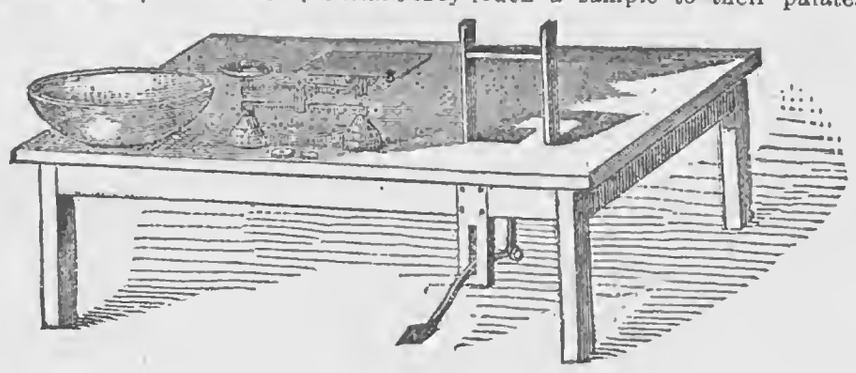
Dairy Husbandry.

THE DAIRY COW—NO. 24.

HENRY STEWART.

Butter Packages.

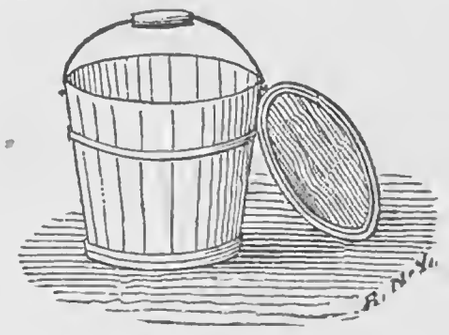
The marketing of butter is an important part of the dairyman's business. A good deal of money is lost by mistakes in this respect. Good butter is thrown away when put up in ill looking, frowzy, unsavory and repulsive packages. A good package will often sell butter of doubtful quality. Buyers are very much impressed with the *sight* of what they buy. To judge of butter requires a delicate sense of taste and smell, and but few persons are so expert in this way as to decide about the quality of what is shown to them, on the instant they touch a sample to their palate.



DAIRY TABLE.—FIG. 46.

But if any hesitation or doubt is felt, the sight of an unexceptionable package will help to determine this in favor of the butter. It is very much in this respect as a person is judged by his clothes—a well dressed man and one with an agreeable presence is treated with more consideration by a stranger than one who comes in shabby dress or unclean person. The dairyman who is desirous of opening new outlets for his product must be very particular as to his packages, so that the first impression created by his goods may lead to a closer examination.

The package, too, has much to do with the preservation of the butter. If it is ill-made, of timber with a bad odor, or worm-eaten so that the moisture of the butter will soon dry out and air will get in, the butter will soon spoil and become rancid. In the family dairy the package is to be considered as much as in the business dairy, because there are times when a surplus product needs to be put away for use when the supply falls off or is suspended altogether for a time.



FAMILY BUTTER PACKAGE.—FIG 47.

The staple trade package is the firkin which holds 100 pounds. This is the most desirable for shipping. It should be made of the soundest white oak and hooped with round hoops, fastened with tinned nails. No iron or copper nails should be used in butter tubs; but, if any should be used, they should never be driven through to the inside. The half tub, which holds about 30 pounds made precisely like a firkin cut down to about one-third of the hight, and covered with a head nailed down on to the top, is a desirable package for the private dairy and is greatly in demand by the retailers. The 50-pounds pail, of which the old-fashioned Orange County pail is the original type, is an excellent package. The best of this kind is one called the "Return Butter Pail" made of white oak, with galvanized iron hoops, and smoothed and varnished outside. The cover is made to fit closely and is secured by clasps which can be keyed tightly. If well packed and covered with paraffine paper and then with dry salt, and this with a piece of white muslin and the cover forcibly pressed down and secured, the butter may be kept perfectly well for a year, if it was as good as it should have been when it was packed.

BUTTER MOLD.—FIG. 48.

To show the effect on the market value of the butter by such a package and such packing I might mention a case which occurred once with myself. I had been sending butter to a New York dealer in the common blue-painted Orange County pails, and had been getting 40 cents per pound, when I heard, through an advertisement, of the Westcott return pail and sent for a sample lot, and one I put away in the cellar. The one sent out sold at 50 cents a pound, and I got an order to pack all my product in the same kind of pails and secured a regular contract, which continued for three years, and until I removed from the locality to another farm. The second pail was opened a year afterwards in perfect order, and was shipped with a lot of fresh ones. Just here I might remonstrate against a very unfair attempt made sometimes by dairymen to deprive their commission agent of the just fruits of his labor. When a good customer is found by the agent for a particularly good line of butter, the purchaser will often find out the dairyman and induce him to make a contract directly with him, unknown to the agent, at lower prices, saving the commission. This is a despicable meanness and a cheat. The dairyman who does such a nefarious act, without the knowledge of his agent or without compensating him for his trouble in securing the customer, is dishonest. These are plain, but true words. If such a favorable business transaction should be made, the dairyman would do a very unsafe thing to carry it out in an underhand manner, for, taking into account the risks of the retail grocery trade, he might very easily get into trouble and lose considerable money by the failure of the grocer to pay his bill. It is better to be safe than sorry, and one is generally sorry after having done a mean or dishonest action. Yet such an action is by no means unknown in the experience of the much-abused and much and often unjustly maligned "middlemen," who do both seller and buyer a valuable service.

To return to our packages—a large business is done with private families, either directly or

through dealers, and for this trade small packages are required. I use three kinds—one of 25 pounds, measuring 9¼ inches in depth and 11¼ in width at the top; one of eight pounds, 5¾ inches deep and 7¾ wide at the top, and one of six pounds, 5¼ inches deep and 6⅛ wide at the top. These are made of white oak hooped with two galvanized iron or brass hoops and provided with a handle and cover, as shown at Fig. 47. The cover is made double of three-sixteenths inch stuff, with the grain crossed, to prevent warping and splitting. When filled and protected as above described, the cover is tied down with twine and the pail can be carried in the hand very conveniently. After many trials of various kinds of packages, these have been found the best for supplying grocery stores and private families, who can have a size to suit their wants and can have a supply lasting one or two weeks, as they may desire.

The 25-pound pails are liked by persons who desire a supply to last two or three months, and are handy for family dairies where two or three months' supply is required ahead while the cow is dry. These pails should all be sand-papered and varnished on the outside, which fills the pores of the wood and makes it air-tight; as the varnish wears off it should be renewed. For a family dairy a desirable manner of putting up the butter is in quarter, half or whole pound cakes pressed in a mold, as shown at Fig. 48. This is turned out of beech, birch or soft-maple wood and made of different sizes. A convenient dairy table is shown at Fig 46 This is provided with a pair of scales and a foot-press for making the cakes. The butter, weighed, if necessary, is put into the mold, which is first dipped in cold water and placed on the plunger of the press; the foot placed on the step presses the butter in the mold and forms the cake. Molds may be made of any shape, round, oval, square, oblong, hexagonal or octagonal, and any device may be cut on the block or plunger. A good deal of first-quality butter is put up for market in this way. Cakes put up in this way are wrapped in paraffine paper and packed in boxes for shipment, the boxes being divided into compartments or nests to prevent damaging the cakes, and ice receptacles are required to keep the butter cold in hot weather. The packing-box should be made of scentless wood, such as spruce, or of well-seasoned ash or white wood.

Sheep Husbandry.

CLOSE CONFINEMENT OF SHEEP.

In the RURAL of January 15, G. G. writing on the above subject, advises the driving of sheep to distant fields that they may paw out and eat a little scanty grass, for fear that "close confinement and idleness" might injure them, especially breeding ewes. I am quite sure G G. has never tried the experiment of housing his sheep, breeding ewes and all, in warm, *well ventilated* stables or barns, or he would have no such fears, nor would he have given such bad advice. How can sheep be injured by being kept housed and warm? What are the ill effects of idleness? Does "Satan find some mischief still for idle" sheep as well as "hands to do?"

I am keeping this Winter over 500 sheep—wethers, breeding ewes, and last Spring lambs. Without an exception they were all placed in pens on November 12, and not one of them has been out-of-doors since, nor will they go until they go to market, or until such as are kept over are turned to pasture at the proper time. They are all liberally fed on corn, bran, oil meal, mangels and plenty of good bright straw that has been kept in the barn since it was thrashed. Hay being scarce and high, they have not tasted it this Winter sofar. Now, if G. G., or, any other RURAL reader will call, I will be happy to show him around, and a healthier, more contented lot of sheep he never saw, or one that looked "more bright and happy;" besides, they are thriving splendidly, and the ewes are dropping as fine a lot of lambs as he would wish to see.

I often wonder at the advice so often and freely given to let sheep run loose and unrestrained over the pastures, to get a bite of green food, when it is so much easier, cheaper and better for the sheep and owner, to raise plenty of roots (mangels or turnips), so as to give them in their warm quarters, all the green food desirable for them to have. Persons giving this advice, don't seem to consider the great damage done to pastures by eating off every spear of protecting grass and gnawing down into the very roots during the dormant frozen season when all this protection is very much needed; nor do they realize that cold affects sheep as well as other animals injuriously, or that much more food is expended in maintaining the warmth of animals than in promoting their growth during the Winter season; nor do they think that allowing the sheep to run at large, only makes them restless and less disposed to quietly eat their Winter's food; this is peculiarly noticeable in the warm days towards Spring. As a rule, not one-tenth the length of the staple in wool is made during the cold of Winter, while, properly housed and fed, a larger proportionate length should be made than during Summer. My sheep are placed in pens or yards about 18 feet squares 20 in each, and I have never yet seen any "ill effects of idleness," and I should be glad to be told what they are. My greatest desire is to keep them as quiet as possible, to make them eat as much food as they can properly digest, and make the largest gain of mutton and wool for the food eaten. We should realize that all exercise takes muscle, that muscle costs food, and food costs money. The pertinent question, the one that must determine whether we keep sheep or not, is whether we *make* or *lose* money by so doing.

Again, we should remember that all exercise tends to harden muscle; in other words, to make meat tough and dry. If we keep sheep healthy, the less exercise they have the finer is the grain, the higher the grade of the meat, and the more money it is worth if designed for the shambles. There is no trouble in keeping sheep healthy in close quarters if properly fed. No man in these Eastern States should attempt to winter sheep unless he has provided plenty of roots for winter feeding. If he has these, and will carefully try the experiment of close housing in warm stables or barns, *well ventilated*, he will find it to pay much better, and will be very unlikely to go back to the old barbarous way of letting them roam over the fields during Winter; nor will the trees and fences be half as likely to be ornamented with dead sheep and lambs.

J. S. WOODWARD.

The Swine-Herd.

CORN vs. MAST FOR HOGS.

HERE, where we have plenty of wood range, a number of farmers are in the habit of relying to a considerable extent upon the mast to fatten their hogs. They feed corn enough only to induce the animals to come home regularly at night, and perhaps give some a few days before selling, and that is all. Whether this style of feeding pays or not is still an open question. Whether the amount of corn saved is sufficient to cover the difference in the price of hogs fattened on mast and that of those fattened on good corn we are not able to determine fully. This much we know—that hog buyers make a difference between the two, and oftentimes when the hogs are to be driven a considerable distance the difference is such as to make quite an item in the aggregate amount. Buyers also discriminate between hogs that have been fed in a pasture and allowed to run and those that have been confined. In case of these and the mast fed hogs they claim that both kinds will not stand driving, that the loss in weight of these two classes is considerably more, in driving the same distance in the same time, than in hogs that have been fattened on good corn or on a good pasture.

In a year like the present there is no question that there is a great saving of feed in allowing hogs to run at large. We had a good heavy mast, and as corn was a poor crop and the price ruled high, there seemed a disposition among farmers to make the most they could from the mast, and in that way economize in their corn. In fact, some farmers raised no corn at all, and depended almost solely upon the mast to fatten their pork: these cases, however, were isolated, the majority deeming it better to feed corn at least once a day. Just how much this affected the profit is hard to determine. Buyers made a difference of between 20 and 30 cents on 100 pounds between mast-fattened and closely-penned hogs and those that had been fattened by feeding corn in pastures.

Of course, in the case of stock hogs that are to be kept over, it no doubt pays to let them run in the woods as much as possible. They are healthier and seem to do better than when closely confined, while the saving in food is considerable. This I can see perceptibly in case of my own hogs. I have two sows I am keeping for breeding purposes, that have had the run of a very large wood pasture all the Fall and so far this Winter. I have fed them one or two ears of corn nights and mornings, with part of the slops from the kitchen, more to keep them in the habit of coming to the house than because they are needing it, and they are doing first-rate, are as fat as I want them, and although the ground has been covered with snow for nearly four weeks they get all the mast they want to eat. At the ame time I have a pig that I am keeping up, and trying to fatten—which I confess is slow work in cold weather—and with all the corn and slop he can eat he is really in no better condition than the sows that are allowed to run, while what I feed him in one day would feed the two sows for three days.

Buyers also claim that mast-fed hogs do not yield so much lard in proportion to weight as those that are corn-fed, and that the meat will fry up more, or lose more in cooking, than that of corn-fed hogs, and this is another reason they give for not paying so much for them. It seems best, however, to do as a large number have done this year, when corn is scarce and high; but with a good corn crop I prefer fattening my hogs with corn, only giving the stock hogs that I purpose to keep the benefit of the mast.

Miller Co., Mo. N. J. SHEPHERD.

The Apiarian.

LIGURIAN HONEY BEES.

In the RURAL of Dec. 11, 1880, under "What Others Say," we read, under the above heading, that "a year or two since many of our apiarians were quite enthusiastic in regard to the merits of Ligurian honey bees, as it was claimed that they were more industrious than either the common bee or the Italians," etc. This, I believe, was taken from the New York Sun. As it conveys a wrong impression I wish to say that Liguria is simply a province in Italy, and therefore Ligurian bees and Italians are one and the same thing. The correspondent of the Sun farther states, giving Mr. Taylor's book as his authority, that these bees gather more honey by robbing the hives of common bees. This is contrary to the testimony of all practical apiarists—not apiarians as the correspondent of the New York Sun would have it. Practical experience in the apiary shows that the Italians are not as likely to rob as the blacks or hybrids, while they will defend their stores as long as there is a handful of them left. That they gather more honey is a fact, and their chief value is in their perseverance, in a poor honey season, in toiling on day after day for the little honey they can obtain, while the common bees seem to think *that little* is not worthy of notice. To illustrate:—In 1872, at the close of the season for basswood blossoms, from which our main honey crop is obtained, we did not have a single box of honey finished. At this time we had both the Italian and common, or black bees. Soon the seed crop of red clover commenced to bloom, on which the Italians went to work at once, but not a black bee was to be seen. As a consequence we took from some of our Italian swarms 60 pounds of box honey, while the black bees had eaten up half their stores from the basswood and had to be fed for Winter. After this we were not slow in introducing Italian queens to all our stock. We now have in the United States Cyprian and Holy Land bees, which were brought from the Island of Cyprus and Palestine, last season, by D. A. Jones, of Canada, and some predict that these will be superior to the Italians. Time will prove which are the best.

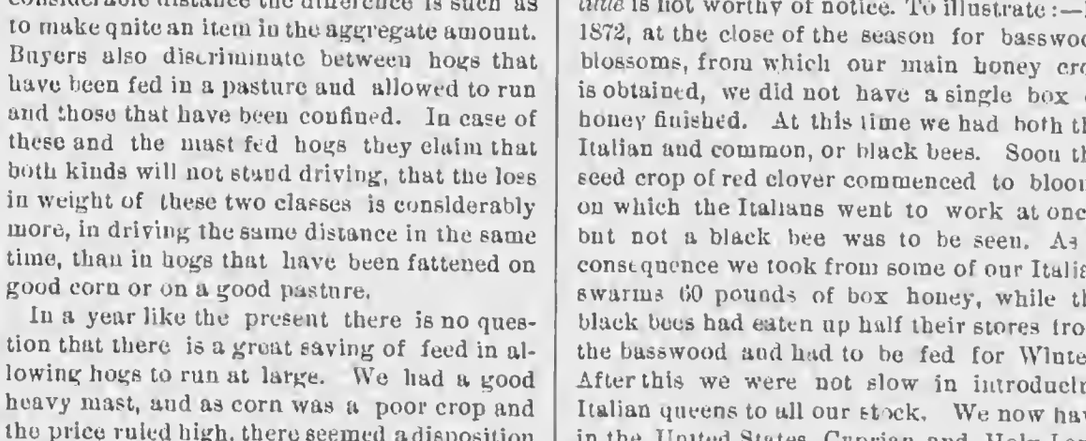
Borodino, N.Y. G. M. DOOLITTLE.

Field Crops.

Experience with Cereals.

I SEE the RURAL says Chester County Mammoth Corn has only one ear per stalk. I have raised it two years and find about one-tenth with two ears. Last season there were three stalks with three ears each, all growing at different points. It yields better than any other variety raised here, but about one-half of it has been caught by frost both seasons. I would therefore consider this as far north as it would be safe to plant it for a field crop. I raise Blount Corn to cut up, it making more and better fodder than other corn. The ears are too small for a field crop. Defiance Wheat is doing splendidly. If it does as well everywhere as the RURAL seed has for me, it will be the coming wheat. I shall try it as a Winter wheat next Fall. I planted five seeds of Cuzco Corn and raised three nubbins, one having grains about half-grown when frost came.

Atlantic, Cass Co., Iowa. W. C. W.



THE VIBRATOR HARROW.—FIG. 49.

Industrial Implements.

THE VIBRATOR HARROW.

THIS harrow, made by the Phelps & Bigelow Windmill Co., Kalamazoo, Mich., and represented by the accompanying illustration, Fig. 49, was introduced to the public late last season. It had previously been tested by a number of practical farmers and nurserymen and pronounced by them to be all its manufacturers claimed for it. Uninterested parties who have used it testify strongly as to its simplicity, durability and ease of draft, and that it cuts the entire ground, leaving it light and smooth. The harrow is made of the best seasoned oak, the teeth are fastened on the front side of the bar by an iron clamp, and are made of Bessemer steel shaped (similar to a cultivator-tooth in front) under furnace heat, and oil-tempered. They are so attached to the bar that with a common wrench they can easily be adjusted to cut any depth from two to six inches, and are so set to the bars that they must cover all the ground. The bars making the frame are connected by heavy wrought-iron hinges, which give it a vibratory motion when cutting hard ground, dead furrows, back furrows, cradle knolls, etc.; and each bar being independent of the others, causes it to clear itself and avoid clogging. It has draw irons on each end, and when drawn backwards makes an excellent and effectual smoothing harrow. It is spoken of very highly for covering small seeds, harrowing wheat, etc., and it combines in this respect the cultivator and smoothing harrow in one tool. It is very compact, as the points of the teeth all fold inward for shipment. We have seen a number of uninterested parties who have used and tested it, and they speak highly of it and think that it must prove a valuable implement. W. H. K.

IMPORTANT PATENT DECISION.—After five years' litigation the barbed wire fence suits have at last been decided in favor of the Washburn & Moen Manufacturing Co., the decision fully protecting them in all their patents and also protecting the Thorne Wire Hedge Co., of Chicago, who have been manufacturing under the Kelly patents. This decision compels all other manufacturers of barbed wire or band wire with barbs, to either discontinue manufacturing them or obtain licenses of the above firms. This celebrated suit has been hotly contested and has caused a great deal of trouble. Farmers and parties who use barbed wire fencing will be glad to hear that it is at last ended. W. H. K.

Scientific and Useful.

EXPERIMENTS IN CATTLE FEEDING.

THE object of this bulletin is to call the attention of the intelligent farmers of this State to a rational system of stock feeding. For illustration a ration for milch cows has been computed, its cost estimated and its practical value shown by a feeding trial which has now lasted over fifty days.

A farmer feeding a good quality of clover hay will find that nearly thirty-five pounds per day will be necessary to maintain the flow of milk and prevent loss of flesh in a cow of about 1,000 pounds live-weight. Now, according to an analysis recently made at the Station, thirty-five pounds of second-growth clover hay from the College Farm contained 4.6 pounds protein; .9 pound fat; 13.9 pounds starchy matter; 10 0 pounds woody; 1.7 ash; 3 9 water. These constituents, however, are not all digestible. A chemical examination of the solid excrements of the cow would show that 1,85 pounds protein; 40 pounds fat; 10 70 woody and starchy matter had passed through the animal undigested, and, as far as nutrition is concerned, had been lost.

If now we subtract from the food eaten, the amount of indigestible matter found in the manure, we shall know how much digestible food there is in thirty-five pounds of clover hay. It will be found to be 2¾ pounds protein, ½ pound fat and 13 2 10 pounds starchy matter.

The cow then which consumes thirty-five pounds of clover hay daily, lives, increases perhaps a trifle in live-weight, and produces its milk from 2¾ pounds protein, ½ pound fat, and 13 2 10 pounds starchy matter. German agricultural chemists have shown that an ordinary milch cow of 1,000 pounds live-weight does not require more than 2½ pounds digestible protein, 4-10 pounds digestible fat, and 12½ pounds digestible starchy matter daily, and

German farmers have proved the correctness of these figures by years of practical experience. Of course, if a cow gives an unusual amount of milk, an unusual quantity of food will be necessary, if loss of live-weight is to be avoided. In such cases the quantity of digestible matter can be increased to 2¾ pounds of protein, ½ pound of fat, and 13 2-10 pounds starchy matter. It will rarely be found profitable, however, to feed more than this amount.

The farm should supply an abundance of digestible starchy matter in the form of fodder-corn, straw, chaff, turnips, &c. The digestible protein and fat can probably, in most cases, be bought at a lower price than the market value of that raised in New Jersey.

The following table will give an idea of the wide range of prices between farm products and such commercial articles as cotton-seed meal, oil-cake, brewers' grains, etc.

100 lbs. of	Cost.	Contain of digestible Protein.	Fat.	Starch.
Timothy hay	$1.00	3.02	1.37	48.58
Clover hay	.75	7.68	1.48	39.71
Corn meal	1.12	6.23	2.89	66.90
Brewers' grains	.25	4.73	1.50	14.29
Cotton-seed meal	1.30	33.00	10.89	12.62

One hundred pounds of digestible protein, fat and starch, cost in

	Protein.	Fat.	Starch
Timothy hay	$6.70	$6.70	$1.40
Clover hay	4.30	4.30	.90
Corn meal	4.90	4.90	1.00
Brewers' grains	2.80	2.80	.60
Cotton-seed meal	2.80	2.80	.60

The second table shows that digestible protein in brewers' grains and cotton-seed meal can be bought for about $2 75 per hundred pounds, while in corn meal it costs nearly $5 per hundred pounds, and in timothy hay $6 70 per hundred pounds. A farmer who can sell his Indian meal at $1 12 per hundred, will see that he is receiving five cents per pound for his protein, and can buy for his own use the same material for 2½ cents per pound.

The point now to be explained is how to use cotton-seed meal in place of corn meal. By looking at the first table it will be seen that 100 pounds of cotton-seed meal contain 33 pounds of digestible protein; that, we know, is enough to last a cow over thirteen days; it contains, too, fat enough to last twenty-one days, while the digestible starch in one hundred pounds is just enough for one day. To express the same idea in another way, we would need only eight pounds of the cotton-seed meal to furnish the cow with the 2½ pounds of protein, while the eight pounds would give twice as much fat and only about 1-12 as much starch as is necessary. We see then that the cotton-seed meal must be mixed with something which contains a large quantity of digestible starch, and a very small quantity of protein and fat.

Wheat straw which contains in one hundred pounds only 3-10 pounds of digestible protein and 3-10 pounds of digestible fat, while it yields 37½ pounds of digestible starchy matters would seem to answer our purpose exactly. It would do exactly, if a cow were simply a milk machine, but a living creature is much more complicated than any machine can possibly be. One objection would be a difficulty to induce the animal to eat such a large amount of coarse fodder. Another would be a fact not yet mentioned, viz: the digestible food should be contained in a ration which, when perfectly free from all traces of moisture, should not weigh more than from 24 to 28 pounds. If the food be mixed with a larger amount of indigestible matter, it is scarcely to be expected that it can be digested and assimilated. Now our ration of eight pounds of cotton-seed meal and thirty-three pounds of wheat straw would contain nearly thirty-five pounds of dry matter, nearly ten pounds more than is allowable.

The ration fed to a herd of six mixed grade cows, at the College Farm, has given perfect satisfaction; it was made up as follows, the calculation being for 1,000 pounds live-weight per day:—

	Containing pounds of digestible Protein.	Fat.	Starch.
6 lbs. clover hay	0.47	.09	2.27
13 lbs. wheat straw	0.11	.04	4.88
20 lbs. brewers' grains	0.99	.33	2.86
20 lbs. turnips	0.26	...	2.06
2 lbs. cotton-seed meal	0.66	.22	0.24
Total	2.49	.68	12.31
The total dry matter was			25.5 lbs.

The total weight of the six cows, taken with all usual precautions, was 5,770 pounds. To find the amount of fodder and feed needed for the herd, we have therefore to multiply the weights, which, as above stated, are for 1,000 pounds, by 5.77. For example:—

6 lbs. clover hay	x 5.77 = 34⅔	pounds.
13 lbs. wheat straw	x 5.77 = 75	"
20 lbs. brewers' grains	x 5.77 = 115	"
20 lbs turnips	x 5.77 = 115	"
2 lbs. cotton-seed meal	x 5.77 = 11½	"

The daily cost of the ration for six cows can now be easily computed:—

35 lbs. clover hay, at $15 per ton	= 26c.
75 lbs. wheat straw, at $7 per ton	= 26c.
115 lbs. brewers' grain, at $5 per ton	= 29c.
115 lbs. turnips, at 10c. per bushel	= 19c.
11½ lbs. cotton seed meal, at $26 per ton	= 15c.
	$1.15
Daily cost for each cow	.19c

The straw was passed through a cutter and thoroughly mixed with brewers' grain, cotton-seed meal and turnips. The mixture was fed in equal portions morning and evening. The hay was fed at mid-day.

The cows were mixed grades taken from a herd of 24 head. They were milked twice daily—the milk of each cow being carefully weighed, and a sample of the mixed milk, together with the record of the yield, sent each day to the Station by Mr. Theodore West, Farm Superintendent.

The following table gives a description of each cow and her total yield of milk:—

Name of cows	Strawberry.	Starface.	Daly.	Dominie.	Sutphen	Carnel.
Age of cows	6 years.	6 years.	4 years.	7 years.	9 years.	7 years.
Weight of cows	965	1,000.	825	917	880.	1,230.
Date of calving	Oct. 23, '80.	Oct. 10, '80.	June 12, '80.	July 15, '80.	Oct. 8, '80.	April 15, '80.
Next calf expected	Aug. 29, '81.	.....	July 15, '81.	Aug. 1, '81.	.....	April 1, '81.
YIELD OF MILK.						
	lbs. oz.	lbs. oz.	lbs. oz.	lbs. oz.	lbs. oz.	lbs. oz.
From Nov. 16-Nov. 26—11 days	273.8	274	166	256	279.12	223.8
From Nov. 27-Dec. 7—11 days	292.8	251	185	259	273	218
From Dec. 8-Dec. 16—8 days	199.8	185.8	147.12	190	199.8	160.4
Total yield for 30 days	765.8	720.8	498.12	705	751.4	601.12

The total yield for the entire herd is 4,042 pounds and 12 ounces.

The weight of a quart of milk for practical purposes may be taken as two pounds. The total yield, then, for 30 days is 2,021 quarts, or 67 3 quarts daily, an average yield for each cow of over 11 quarts.

1. From the experiments it appears, then, that the cows have gained a little in flesh by being fed on this ration, and that their flow of milk has not diminished.

2. It is fairly proved that the ration saved directly 30 per cent. on the cost of a full ration of clover hay, and still more than this on one of clover and Indian meal.

3. The ration also saved indirectly by turning to profitable account the straw and coarse products which are ordinarily only used for manure.

4. The whole experiment shows that the live stock on a farm can be kept in good condition, and a much larger amount of its high-priced products sold than it is now the practice to sell, or that a greatly increased amount of live stock can be profitably kept while consuming all the food products.

The above is but a single example of the use of a computed ration. It was made for a special purpose; and there might have been others calculated which would have been quite as economical. The Station has analyzed a number of the commercial articles used as cattle food, such as Indian meal, Egyptian corn, cotton-seed meal, oil-cake meal, brewers' grains, starch waste, timothy hay, clover hay, Hungarian grass, wheat straw, wheat chaff, etc. These will be published, together with rations computed from them, in the next bulletin. GEORGE H. COOK.

Director Ex. St'n, New Brunswick, N. J.

Miscellaneous.

CRATES.—F. H. D., page 34, is quite right concerning the convenience of crates for carrying apples, etc., into the cellar; but I do not agree with him that they are the best thing to store them away in, because they "admit of a free circulation of air." I think apples will keep better without a free circulation of air. I never had apples keep better than those I had last Winter (a bad Winter for keeping fruit) in bins in a cellar, holding 30 to 70 bushels. Careful picking is the best thing to make apples keep well. I have been astonished to notice how much cold weather it takes to freeze an apple, and after freezing how much freezing it takes to injure one. I think apples will not freeze with the thermometer indicating 28 deg. But about the crates. They are particularly valuable for carrying in potatoes. I am quite sure I saved some of mine by having two sets of crates and two wagons to draw them in one cold night last Fall. They are also valuable for carrying apples and potatoes to market. They should be made large enough to hold a bushel when a little less than even full. Thus one crate can be set upon another and a good-sized load can be easily inspected and carried. It is well in building them to have them made of the right size, so that two, side by side, will fit the wagon-box. G. S. W.

WHISKEY FOR DIPTHERIA.—The RURAL has given what are reported to be valuable preventives in cases where diptheria was to be feared. But it is now said that whiskey is one of the best of these, to be administered freely as soon as the soreness in the throat makes its appearance. At least, this is the treatment now adopted in the towns and cities along the river and canal, south of Chicago, where the sewerage of that city has so contaminated the water of the river, as to give rise to epidemic and in many cases fatal diptheria. It is now thought that the poison which produces the disease is a septic one, which leaves the vitality like the venom of poisonous snakes and insects, and that the best remedy is a stimulant in the first stages, and that whiskey is the best form in which this stimulant can be found. J.

Everywhere.

RURAL SPECIAL REPORTS.

N. Y., Waterville, Oneida Co., Jan., 20—The weather since Jan., 1, has been about all that farmers could desire. The sleighing is splendid, and although there is quite a heavy body of snow on the ground, it is spread so evenly that there is little trouble in getting anywhere with a team. A. W.

OHIO, Ripleyville, Huron Co., Jan. 6.—We are having the nicest Winter that we have had for many years. We have had good sleighing most of the time since Thanksgiving. Wheat was looking fine when the snow came. I see no reason why we should not have as good a crop as last year. Wheat is worth 95c.; corn, 45c.; oats, 30c.; hay, $18; butter, 18c.; Clover seed $4.50. R. K.

CHAMPAIGN, Champaign Co., Ill., Jan., 20.—There has been no break to the uniformity of the Winter since it set in early in November. But it looks to day as if a thaw was coming up from the South and coming up to stay. Heretofore south winds during the Winter have only blown for a few hours before they were driven back by other stronger ones from the north and northwest. There is still some snow on the ground over the entire State, and it is a mercy there is, for snow is the only resource the stock have for water over great portions of this and States adjoining. In fact, the water famine has developed into a serious business, if not into alarming proportions, and if the snow leaves slowly, without filling the streams, and they continue frozen solid as at present, in some sections stock water will be so scarce that stock must suffer severely and the dry murrain and kindred diseases do immense damage to flocks and herds. Just how to meet this sudden apparition is now the problem before us; and all the more difficult it is, because in many sections the earth beneath for several feet is as dry as a green bone. Concerning the outcome of the corn crop there is a great difference of opinion; but no one claims the crop of 1880 nearly equal to that of 1879. And as to future prices there are still greater differences. Some say we are on the eve of a period of high prices for corn, or something more, and remind us there are now six distinct markets for corn, where there were only three, a few years ago. Ten years ago the home market, the Eastern market and the Southern market took the surplus; the foreign taking only ten million bushels in 1870, against 100 millions in 1880. The six markets of the present are: 1, Home market, 2, the Eastern market, 3, the Foreign market, 4, the Southern market, 5, the Western market made by the rapidly developing mining regions east of the Rocky Mountain Range; and, 6, the Northern market for corn to supply the bonanza farm region north of the limit of successful corn cultivation. Up to this time we have heard nothing of the Winter wheat crop, that is not favorable. There has been practically no thaw since the first freeze up, early in November, and the snow covering the ground almost uninterruptedly, a condition very similar exists to that of 1879. If a dry, cold Winter is one of the best assurances of abounding crops the succeeding Summer, there is a fine prospect before the farmers of Illinois, and the entire West also. B. F. J.

ILL., Baileyville, Ogle Co., January 21.—The weather had been extremely cold here at times this Winter—from 22 deg. to 32 deg. below zero, on certain days, and for several days in succession not rising above zero. I find from various reports that thermometers differ several degrees at only short distances apart, observations being taken at or about the same time. This variation may be owing to the different situations of the thermometers, or to some difference in the instruments; so it is difficult to ascertain the true temperature of a place, except through the careful observations of the Government Signal-Service Bureau, on uniform thermometers, at stated hours each day; and even these are not always as correct and reliable as they should be. Though the weather has been cold, there had been but little snow in this locality until a week ago. On Thursday, 13th inst., about six inches of snow fell. The next day, Friday, was clear and cold, our thermometer registered 26 deg. that morning at sunrise. This was followed on Saturday and Sunday by another snow-fall of some six inches, making the snow over a foot deep and fine sleighing, as it has not drifted, and the roads are smooth and solid. The Winter grain will be greatly benefited by its present covering of snow and may yet do well, though fears were entertained that it was injured by the previous dry, hard freezing and bare condition of the ground. Cloudy this morning, and 26 deg. above zero. All who can do so are enjoying the time sleighing, etc., and business seems brisk, but there is not much grain selling, as prices continue low here and unsatisfactory to the farmers. Wheat, 60@85c; corn, 30c per 60 pounds shelled; oats, 28c; barley, 30@40c; rye, 80c, but little here. Butter (dairy), 18c; eggs, 28@30c per doz. Beef (live), $2 50@$3 50, and pork (live), $4 @$4.50 per cental. Dressed beef sells at 4@6c per pound by the quarter. Hay is scarce at $10 to $15 per ton. W. B. D.

ILL., Franklin Grove, Lee Co., Jan. 10.—We are having an old-fashioned Winter out here; but we have had very little snow. Winter wheat was badly frozen, but I don't think it is entirely killed yet. Stock is wintering through nicely. Hay and coarse feed are rather scarce, but corn is plentiful, worth now 33c. and 40c. for May delivery. S. W. R.

IOWA, Dakota, Hmnboldt Co., Jan. 13.—Last year the crops hereabouts were good. wheat yielding, on an average, from 20 to 25 bushels per acre, and corn, from 40 to 60. Oats were an immense crop. J. S. H.

MO., Buckln, Linn Co., Jan. 20.—We have had but a few inches of snow at a time, though the weather has been cold, especially during "holiday week." I have seldom seen a more beautiful sight than presented itself to our view just as the sun was rising one morning. Two sun-dogs appeared, each as radiant as the sun. Either alone would have made daylight. Of course, when they rose from the horizon they were not so bright, but they kept in the sky all day long, and were with the sun at his setting. Our weather for the past week has been playing "snap and catch 'em"—warm one day and cold the next. J.

MO., Pleasant Mount, Miller Co., Jan. 12 —So far we have had an extremely cold Winter, Between Christmas and New Year's the weather was extremely cold, the thermometer getting as low as 23 deg. below zero, lower than it has ever been in this section, so far as I can learn. Happily for wheat, the ground is covered with a good depth of snow, else Fall-sown grain must have suffered. Farmers are doing nothing but trying to keep warm. Nearly all fat stock has been marketed, and the remaining corn is being saved for feeding through the Winter what stock is being kept over. N. J. S.

N. C., Asheville, Buncombe Co., Jan. 18.—We have had a rather severe Winter—thermometer as low as 8°, and four snow storms. The snows were light—two to three inches at a time—when, strange to say, there was four or five times as much in the warmer parts of the State. It is now warmer (50°) and raining. D. E. S.

KANSAS, Manhattan, Riley Co., Jan. 19.—The weather has been so unusually cold that we have reason to anticipate the ruin of our peach crop. This morning the thermometer registers 8° below zero, and it has been down to 21° below. E. G.

TEXAS, San Antonio, Bexar Co., January 10.—We have very cold weather. Wheat and oats are killed. We had a regular snow storm yesterday. Farmers are busy plowing and sowing small grains. This is a curious climate—there is not a month all the year round in which some kind of a crop is not planted or harvested. Some are gathering corn; others picking cotton whenever the weather permits. Prices are very good; corn, 70@80c; hay, $12@14 per ton; cotton, 10c. per pound; eggs 25@35c. a dozen, butter 25c. G. W.

The Querist.

ANSWERS TO CORRESPONDENTS.

Preparation of Bones, etc.

H. N. L., address mislaid, asks a cheap way of converting old, dry cattle bones into manure; and their value in comparison with that of barn manure.

ANSWER BY PROFESSOR E. W. STEWART.

The method of reducing bones depends upon their condition. Green, tough bones are very difficult to grind, and the appropriate mills are too expensive for individual use. But "old, dry cattle bones" which have lost nearly all their animal matter from long exposure to the air, will be found more brittle and can often be ground, after having been broken with a hammer, in a bark mill, or in a strong

corn mill. The most important ingredient for which bones are used as a manure—phosphate of lime—still remains in the old dry bones, but they have lost nearly all of their nitrogen in the decay of the gelatine and other animal matter. Various methods have been employed to reduce bones to a proper condition for use as a fertilizer.

Dissolving in Acid.

The best way, that is the way by which the best condition is obtained, is by dissolving them in sulphuric acid, when a superphosphate of lime is formed which is soluble, dissolving in water, ready for absorption by plants. When sulphuric acid can be obtained for two cents per pound, any intelligent farmer can afford to use it. In dissolving with acid, take any tight cask (the most substantial is a large linseed-oil cask, or petroleum-oil barrel); remove one head; fill it one-third full of water; then pour in one-third as much acid as there is water and stir together. Now take these old dry cattle bones that have been broken with a hammer, and fill the tub or barrel nearly full of them, stirring them about in the acid water; when the barrel is full, cover it so as to exclude all the air you can. Stir these bones every day for two or three days, then remove the coarser pieces into another barrel; pour off the acid into the other barrel letting it drain, and the fine bone will be found in the bottom. This fine bone will be the very best quality of superphosphate of lime. It may be dried by mixing it with fine, dry earth, such as road dust, dry, sifted muck, etc. One ton of these old dry cattle bones, dissolved in this way, will be worth about as much as three tons of the commercial superphosphate.

Boiling in Lye.

Another way to prepare them for use where wood ashes are cheap, is to leach the ashes and boil the bones in the lye. This hot lye will eat them up rapidly, and the bone is made finer than ground bone. This fine bone reduced with lye is not quite as soluble as that dissolved in sulphuric acid, but the potash from the lye will be found an excellent addition to the manure. Soils are nearly as often deficient in potash as in phosphoric acid. I have found this bone dissolved in lye to be a special fertilizer for potatoes, and also for grass and grain crops. This work may be done at the rate of 1,000 to 1,500 pounds of bone per day in two four-barrel kettles or in a large pan.

Fermenting Bones.

The earliest method known for disintegrating the particles of bone, was by mixing bones in compost with earth, ashes, horse manure, etc. Place a layer of horse and cattle manure, then a layer of broken bones, another of horse manure, and so on till the bones are all used, wetting each layer with urine. Now keep this pile moistened with urine from the stable, and the heat and fermentation will soon cause the bones to crumble and become fine enough for use. If wood ashes can be had cheaply, then ashes should be mixed with the bones and will assist in their decomposition; besides, the ashes will be worth all they cost as an addition to the bones.

Steaming Bones.

Bones may also be reduced to fine bone dust by steaming under pressure, and if large amounts of bones can be had cheaply, it would pay a few farmers to join and purchase a boiler to steam them. The best form of boiler for this purpose is that used for extracting glue from bones. It is a simple cylinder 2½ to 4 feet in diameter, 10 to 20 feet long, hung on trunions at the ends, so that it may rotate over the fire. This is required to be strong enough to stand 50 to 80 pounds pressure to the square inch. The boiler itself is filled with bones and then half filled with water. It is then rotated slowly over a brisk fire and is soon brought to a pressure of 60 pounds; and green bones are quickly deprived of their gelatine, and solid bones will crumble between the fingers. This fine bone is much more readily soluble than ground bones not steamed.

Bones vs. Barn-Yard Manure.

The comparative value of bones and cattle manure is not easily determined, since the quality of manure varies so widely, dependent upon the food and purpose for which the animal is kept. If the cattle are poorly fed, the manure per weight has less value. The manure made by milch cows has less value than that from fattening cattle, if both are fed the same. We will compare bones with cow manure when the cows are highly fed. Prof. Horsfall, one of the most intelligent English experimenters, had the liquid and solid excrements from six cows analyzed by Prof. Way, getting as complete an average for the six cows as could be obtained for 27 weeks. The average was as follows:

	Per cent.	In 2,000 lbs.
Moisture	84.85	1,697.00 "
Phosphoric acid	.39	7.8 "
Potash	.58	11.6 "
Soda	.22	4.4 "
Other substances	13.96	279.2 "
	100.00	2000.00 "
Nitrogen	.41	8.20 "
Or ammonia	.49	9.80 "

This would make this cow manure worth, at the commercial prices charged for nitrogen, phosphoric acid and potash, $3 34. Those dry cattle bones have lost the principal part of their nitrogen, but as the animal matter has decreased, the phosphate of lime has increased. If, then, we estimate the nitrogen at two per cent or 20 pounds in 2,000, and the phosphoric acid at 25 per cent. or 500 pounds; and if the phosphoric acid is estimated as half soluble and half insoluble, this would give the value when prepared as $51.10, or more than fifteen times the value of this first quality of barn-yard manure. But it is safe to say that a ton of dry cattle bones, after preparation, is worth as much as 20 tons of ordinary barn-yard manure.

Many Questions.—The Distribution will probably be begun in two weeks.

We cannot substitute seeds or plants of any kind for those announced in the present distribution.

The RURAL does not *sell* seeds or plants to subscribers under any circumstances.

Blount's Chester Co. Mammoth Corn will be found in the catalogues of seedsmen whose announcements may be found in our advertising columns.

The Argenteuil and Dutch Asparagus seeds cannot be procured in this country except through the RURAL'S Distribution. The RURAL also controls the Rural Branching Sorghum.

We have kept a careful account of those who have applied for our Seed Distribution sending their share of stamps (six cents) When the Distribution shall have been completed, due notice will be given so that those who, from mail irregularities or from any other cause, have not received it, will have the opportunity of advising us by postal card.

Dropping the Cud.

G. T. C., Belden, N. Y., has a 20-months-old steer which was lately taken sick, vomiting all he had eaten. His horns are warm, and eyes a little dull. On vomiting he acts as if about to raise the cud to chew it; but instead of chewing it, he lets it run out of his mouth, drooling most of the time. During the Winter he has been fed corn-stalks twice a day, with some corn and hay once a day, and our friend asks what ails him and how to treat him.

ANS.—This is known as dropping the cud, described in the RURAL of January 22, and is not vomiting. It is a frequent result of indigestion, which may result from feeding too much dry feed, or smutty fodder. It may also occur in young animals from soreness of the gums incident to the shedding of the teeth and the growth of the permanent ones. This should be learned by examination. If the teeth are all right, the cause will be dyspepsia. There is generally no appearance of ill health in mild cases, except, perhaps, a roughness of the coat. It occurs with sheep as well as cattle, and should be treated as advised in our issue of January 22, or as follows:—Give one pint of linseed oil and repeat it the third day. Then give each day for ten days half a tablespoonful of carbonate of soda, with one teaspoonful of ground ginger in a mess of scalded bran or linseed meal.

Feeding Cows Before Calving.

M. H. C., Orange Valley, N. J., asks the safest way to treat cows during the month or six weeks before they calve. Our friend has been told they should be fed upon hay only; but the man in charge of the cows says he always feeds grain up to the last day before calving; yet as one cow has already been lost, owing to what the neighbors insist on calling his mismanagement in this matter, our opinion is asked.

ANS.—As a cow approaches the period of calving the system becomes much disturbed and the circulation is considerably increased; the cow is taxed to the utmost to keep up the extra quantity of blood which supplies the calf, and is in such a condition that a very slight cause, as cold, indigestion or over-feeding, may do much mischief. It is therefore very dangerous to feed any grain to a cow in this state for several weeks before she comes in. Good hay is all that is required; a few roots would be advisable, but even a bran slop is to be given with caution and only when it is required as a laxative. To feed grain stimulates the milk organs unduly and is almost always productive of garget, or congested udder. After calving, too, for at least a week, grain food should be given with extreme caution.

Leather as a Fertilizer.

E. F. D., Lynn, Mass., asks the value of leather ashes as a fertilizer.

ANS.—It is an enormous waste to burn leather. It leaves but one per cent. of ash and the volatile part contains nearly 12 to 15 per cent. of nitrogen, which is more than is contained in blood by at least three or four per cent. The difficulty in using leather is that the tanning has made the gelatine of the skin, which contains the nitrogen, insoluble and it is difficult to decompose it. Usually, the leather available for this purpose is in the shape of clippings which are more easily handled. They may be composted with stable manure or with moist earth and lime, or moist wood ashes. The lime or ashes decompose the leather, and the earth holds the escaping ammonia. Or the leather is made very brittle by treatment with sulphuric acid, and may then be reduced to powder with ease. One ton of leather clippings would contain about 250 pounds of ammonia, or even more, worth at market prices about $60 to $75. This is, of course, the theoretical value; but it goes to show the value of this waste matter. The ash is mostly potash and a ton of the leather would contain but 20 pounds, worth $1 or thereabouts. This shows the waste made by burning it.

No Substitute for Glass for Hot-Beds.

D. M. H., Richmond, Va., asks whether we can recommend a substitute for glass in making hot-beds, sashes being dear there.

ANS.—We are sorry to say that no substitute for glass for a hot-bed has yet been discovered. So-called substitutes have sometimes been recommended; we have tried them, and many others, but they all fail of their purpose, and we should only mislead you in recommending them. Plants that are forced (as they are in a hot bed) must have a clear light, which glass alone can give; otherwise they become blanched and drawn, and useless. Glass may be dear in Virginia, but you will assuredly find it much cheaper to buy it than to attempt the use of the best substitute that we could name. For a cold-frame, oiled paper may be made to answer tolerably well, if you have plenty of time to spare.

Miscellaneous.

O. W. F., Blackstone, Mass., sends some specimens of Blount's Corn; there were three ears on a stalk; one was flint and the other two dent, and our friend, asks, 1, whether the corn is likely to change to flint as far North as his place—near the boundary line of Rhode Island and Massachusetts; 2, what is the value of bone-black as a fertilizer after it has been used in case-hardening tools.

ANS.—1. The specimens sent would seem to show that it would soon turn to "flint." Only a longer trial can answer your question. Should you again raise it next season, we would be pleased to learn the result. We would like also to have seen specimens of the flint ear. 2. The bone-black is merely phosphate of lime; all the organic matter has been driven off in the carbonizing of the bone, leaving all the phosphate. All that is needed is to treat it with sulphuric acid in the same way as other bone-black or bone ash, when it will be pure superphosphate without any ammonia or nitrogen.

S. A. C., Queens Co., L. I., asks several questions which the following answers will explain.

ANS.—Yes. We are happy to answer all questions under this department, which seem to be of interest to the general reader. It *sometimes* occurs that our space is insufficient to do this, in which case we endeavor to answer by mail. We are always glad to give any information in our possession respecting our advertisers or the articles advertised in our columns. Any complaints from our subscribers as to unfair dealings are at once investigated, and if ascertained to be well-founded, the facts are placed before our readers if satisfaction to the complainant is not at once made.

H. D. F., Palmer, Mass, asks whether there is any legal standard for a barrel of apples or potatoes.

ANS.—We do not know what the law with regard to the matter is in the Old Bay State, but in the Empire State there is no law anent it. An effort was made last year to have a law passed regulating the size of a barrel of apples; but though it got through both Houses, it failed to receive the Governor's signature. We learn, however, from Assemblyman John Shanley that he intends to press a similar law during the present session of the Legislature. There certainly ought to be some legal standard.

J. W. S., Smith's Grove, Ky., asks, 1, whether land that has been cleared and cultivated seven years will do for planting cabbage; 2, what kind of seed should be used for market cabbage.

ANS.—1, That will depend on the richness of the soil. It cannot be too rich or too thoroughly pulverized before planting. The cabbage is a rank feeder and requires a deep, rich soil to bring it to the highest point of profit. If your soil is rich and strong you can profitably raise cabbage, especially if it is a sandy loam. 2, Wakefield for first; Early Flat Dutch for second, and Silver Leaf Drumhead and Drumhead Savoy for late.

D. S. D., Crown Point, N. Y., asks, 1, where can he get instruction about budding and grafting nursery fruit; 2, do we think it any benefit to whitewash young trees in Spring.

ANS.—1, We shall give full instructions as to grafting in the Hardy Shrub and Tree Number which will be our next issue. Budding is usually performed in Summer. 2. Yes, we do. And it is well to add to the whitewash a little sulphur, soft-soap, carbolic acid, etc. Lamp-black may be added to give a color to the whitewash nearly resembling the color of the bark.

M. T. A., Hopeville, Iowa, asks, 1, our opinion as to the practical value of barometers to farmers, and, 2, what make we would recommend.

ANS.—A good barometer is doubtless of much value to the farmer, but a poor one is worse than none. It requires considerable experience, however, in studying the variations of atmospheric pressure, as indicated by the barometer and thermometer, before the former can be relied upon as a weather prophet. 2, Chas J. Tagliabue, 53 Fulton Street, N. Y., makes a good article.

W. R., Jeromesville, O., asks how to make a persimmon bear fruit.

ANS.—Persimmons—when they bear at all—usually bear in six or seven years from seeds; by grafting, however, they can be made to bear earlier, like other fruit. Perhaps one-fourth of all persimmon trees never bear at any age, as they are males which bloom profusely but never bear fruit. A friend from Tennessee writes us under date of the 13th inst., that he had then some large trees with bushels of fruit on them, and that after the hardest freeze the trees do not drop their fruit until February.

John A. Morse, Halcotville, Delaware Co., N. Y., says:—"I have looked over your advertisements in vain for what I want; that is, a small steam boiler which can be set on a common cooking stove in the kitchen, and that will generate steam enough to cook about one bushel of ground feed. If you know where something of this sort can be got, let me know. If there is nothing of the kind I shall have to invent one, as I know of other farmers that want one also."

N. T. M., Parkersburg, Ia., asks, 1, for a description of the Waushakum Corn; 2, where seed can be had; 3, in selecting corn for seed, do we reject the small grains on butts and tips of ears.

ANS.—1, We suppose it to be a variety of the eight rowed Canada Yellow Flint. The ears are eight-rowed and average nine inches long. Kernels broad and rather shallow. 2. Address E L Sturtevant, South Framingham, Mass. 3. Yes, for seed we always reject the tips and butts.

G. G. B., Manchester, Vt., asks where can he buy a dog churn such as that illustrated in the RURAL of January 6.

ANS.—The "power" referred to can be attached to *any* churn. The form of churn in the illustration was not designed to represent any particular churn, but only to show the *modus operandi*. The motive power may be either a dog, sheep, goat, calf, donkey or horse, according to convenience or the requirements of the case.

W. M., address mislaid, asks the name of a good publication on fish culture.

ANS.—The best we know of are the Reports of the U. S. Commission of Fish and Fisheries, to be had through the Congressman for the applicant's district or the Senator for his State; and Fish Hatching and Fish Catching, by Seth Green, price $1 50, to be had of the Am. News Company, N. Y.

J. D. L., Jacksonville, Ill., asks where can he get a book on the cultivation of flowers—such a one as would be of use to a plain farmer's family.

ANS.—Breck's New Book of Flowers, price $1 75, and Henderson's Practical Floriculture, price $1 50, are good works, and may be obtained of the American News Co. of New York.

E. C., Menardville, Texas, asks where could he get punches made like nippers to cut his "initials" on sheep's ears.

ANS.—No such a punch is made that we know of. The nearest approach to such marking is the metallic ear marks made by C. H. Dana, West Lebanon, N. H.

O. P. G., Kingston, Ohio, asks where information can be obtained concerning the National Farmers' Alliance.

ANS.—Write to W. J. Fowler, its President, Pittsford, N. Y.

W. H. E., E. Setauket, L. I., asks what is the best kind of sweet corn to plant for all purposes, as late as July.

ANS.—Probably the Concord.

COMMUNICATIONS RECEIVED FOR THE WEEK ENDING SATURDAY, JAN. 29.

C. H. S.—N. R.—T. D. B., thanks. The last word of the rebus has not yet been guessed.—M. H.—Every one of our readers should send for the catalogues announced. They cost little or nothing, and all should compare one with another before making out orders. Much is to be learnt by a study of these catalogues.—H. S.—A. H.—E. F. P.—J. V. D. P.—W. M.—E. P. R.—L. THE
Rural New-Yorker,

PUBLISHED EVERY SATURDAY.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, NEW YORK.

SATURDAY, FEB 5 1881.

NEXT week's RURAL NEW-YORKER will be the Hardy Shrub and Tree Special. The Small Fruit Special will be published in about three weeks thereafter, or early in March.

CATAWBA grapes are selling to-day (Jan. 27) for four cents per pound. They are sound and excellent. Where is the kind among our much-talked-of new grapes with keeping qualities and excellence like this!

HORSE SHOES KEPT ON TOO LONG.—THERE seems to be no doubt that this causes more injury to the feet of a horse than any thing else; for as soon as the shoe is fastened on a double action begins, as his hoof grows down and presses against the shoe, and the shoe is hammered forcibly up against the hoof every time the foot is set back on the ground after being raised. This makes the double action which is so apt to prove injurious. To obviate this, it becomes necessary to have the shoe fit nicely and easily at all times to the horse's foot. To insure this, it should be taken off and reset about once a fortnight; and in doing so care should be taken to first file off the clinching part of the nails outside of the hoof, so they cannot make large holes or tear the hoof as they are withdrawn. Some let shoes remain on the horse two or three months. Nothing can be more injurious to keeping up a sound, good foot than this. The change twice a month or so, allows the foot to expand, and keeps it in a healthy, natural form.

BEEF AND MUTTON IN ENGLAND.

NOTWITHSTANDING the constant large importations of these from America and Australia, the English papers inform us that the prices not only keep well up there, but are likely to continue to do so. This is owing mainly to the increasing population, and the increasing prosperity in the manufacturing districts. Moreover, those people who formerly got meat of a poor quality only about once a week, on account of its high price, now that abundant importations have placed before them a superior quality at a lower price, can afford to have it nearly every day on their tables, and hence this greatly increased consumption of meat in the United Kingdom. As to mutton more particularly, the liver-rot has again broken out among the flocks of Great Britain causing many deaths in them from the disease, and this again assists to keep up the price of mutton as well as of beef and pork.

American flock-masters will see that the above enforces what the RURAL has repeatedly said to them—that various causes have contributed for years past and would continue to combine probably for years to come, to keep up the prices of sheep, wool and mutton in America. Let them go on now with a good heart and prosper.

AN EXCELLENT EXAMPLE.

FLORIDA, it is reported, has closed a contract for draining Lake Okeechobee, a name under which are included a small, shallow lake and an extensive adjoining swamp, both together covering an area as large as Massachusetts and Connecticut. The reclaimed land will, it is said, be admirably adapted for the cultivation of the sugar-cane, and the drained acreage will be large enough to produce all the sugar the United States are likely to need for years to come. Bright as are the promises of abundant sweetness from the Florida swamps, however, it would hardly be wise to allow the distant prospect to interfere with the growing industry of sorghum sugar-making. The most praiseworthy feature of the enterprise is that the State has undertaken the work, without appealing to the National Treasury for aid. Hundreds of thousands, aye, millions, of acres excellently adapted for sugar-cane culture, now lie either pestilentially reeking in the swamps of Louisiana, or equally waste along the lower Mississippi, all of which could be permanently reclaimed for profitable cultivation at a cost of much less than the profit therefrom in a single decade. For years the General Government has been importuned in vain to undertake the construction and repairs of the Mississippi levees in order to make these wastes bloom like a garden; isn't it time that the States which would chiefly profit by the improvement, should follow Florida's example and straightway accomplish the work themselves, assessing the cost, or the greater part of it, on the land-owners benefited most by the undertaking. State rights and State duties are inseparable. We have heard much of the former and would like to see a little more of the benefits of the latter.

GREATER CAPACITY FOR HANDLING GRAIN NEEDED.

THE wheat raisers of California are in a distressful condition owing to the insufficiency of shipping on the Pacific coast. Freight charges are consequently so high that farmers who have to sell their wheat now must do so at a loss, and the banks cannot foreclose the loans they have made on the crop, without creating a panic. At San Francisco there is not a sea-going vessel of any kind disengaged. Those under charter are either loaded, or the necessary amount of wheat to load them is received. All, or nearly all the ships to arrive within the next three months are under charter, and the tonnage expected is very light, as freights are good everywhere. The storage capacity in the city is crowded, and owing to the slow rate of shipment room for fresh arrivals can be made only very gradually. A convention of farmers is about to be held in San Francisco in a few days to devise some means by which they can sell their grain, if not at a remunerative rate, at least so as to avoid a loss. Negotiations are now pending with the Central and Southern Pacific Railroads for the transportation of the crop across the continent to the Atlantic tide-water. The general impression seems to be that, in case it cannot be transported overland, the correct course is to hold it until next July, when it is confidently expected it can be sold at paying figures. At all the chief railroad termini there has been a great deal of trouble the past season on account of insufficient storage room for the enormous crops of the country, and measures should be promptly taken to remedy this source of inconvenience and loss before next harvest. Neither transportation facilities nor storage capacity is increasing as rapidly as production.

NOT THE MAN BUT HIS WORKS.

IN the Prairie Farmer (of Chicago, Ills.) of Jan. 22, we find the following:

"The RURAL NEW-YORKER of Jan 15., takes us to task for "magnanimously" offering the use of our columns to Mr. Le Duc to purge himself from the charge of a "crooked" proposition relating to the importation of live stock, which appeared in the National Live Stock Journal a short time previously. Men possessing a decent self-respect and honest motives are not apt to pass quietly over an accusation so direct and grave as this, coming from a reputable source. The Prairie Farmer offered Mr. Le Duc an opportunity to defend himself. But the RURAL NEW-YORKER thinks that he would belittle the important office he holds were he to return an answer to what it pleases to call "a vague charge of this sort." The source of the accusation, and the manner in which it was made, remove it from the category in which the RURAL NEW-YORKER would place it; still the Commissioner is as silent in regard to it as a graven image; and so he will remain. The difference between the National Live Stock Journal and the RURAL NEW-YORKER is, the former knows what it is talking about, and the latter does not.

It may be true respecting what we have said of Gen. Le Duc, that we have not known what we were talking about. Our acquaintance with him is very slight. It was not the man but his *work* that we desired to shield from what seemed to us unfair—unjust criticism. His *work*, so far as we are capable of judging, speaks for itself—and it speaks loudly—powerfully in his praise. As to the *character* of Gen. Le Duc, the Prairie Farmer *must be* in possession of facts of which we are utterly ignorant, else, if actuated by good motives, it could never have brought itself to publish the serious charges it has repeatedly made against him. It may be that we have quite overlooked the Commissioner's character in our appreciation of his good work; but when it is plain that the agricultural interests of our country have been and are being benefited as they have never been benefited before by government instrumentality, one is not over-anxious to reveal flaws when little has appeared to indicate their existence. The editorial above quoted concludes as follows:

"The alacrity of our Eastern contemporary to rush to Mr. Le Duc's defence is not surprising. Its editor has always been 'sweet' on the Commissioner, and it is not probable that these 'glucosities' are all one-sided."

We hope that, unless the editor of the Prairie Farmer simply desires to injure the RURAL NEW-YORKER or its editor personally, it will, upon reflection, be willing to recall the insinuations of the above paragraph.

OUR GROWTH IN POPULATION.

THE complete census returns show that we are now a nation of over 50,000,000 people,—a nation second to but one in Europe, Russia. What a wonderful advance has been made since the enumeration of 1870! In these 10 years the population of the United States has increased over eleven millions and a half, or three times the population when the first census was taken in 1790. Increasing in the same ratio, in 1890 we shall number 65,000,000 souls, in 1900, 85,000,000, and in 1950,—a year which some now living will doubtless see—we shall be a nation of over 300,000,000 souls, and all that when our Republic—for this may it ever be!—shall be but in the last half of the second century of its existence.

But the growth of our cities has been most remarkable. The enormous influx of population to these centers, both from our own fair hills and vales, and from foreign shores, has increased their population far more rapidly than our total population has been augmented, and, with this arise great social and moral problems which call for speedy solution. Four European cities—London, Paris, Vienna and Berlin—outnumber our first four—New York, Philadelphia, Brooklyn and Chicago,—and decades of years must pass before we can compete with them, but while all Europe has but 75 towns of over 100,000 souls, America has already 20 of that number of inhabitants, and each the metropolis of its own district.

The increase in the number of immigrants who are to-day making a large proportion of our city population, is a factor to be considered. During December last, 24,000 foreigners came to our shore, and during the six months ending December 31, 277,000, made America their home—an increase of 132,000 over the corresponding six months in 1879, while the total number of newcomers during last year amounted to 550,000!

Whether we can continue for years to assimilate this vast annual addition to our numbers, is a debatable question. What a future is before us! What wisdom will be needed to maintain our present course as a Republic! How grand the service we may render to mankind if the world shall be taught that a Republic can exist, and not only exist, but be prosperous, with a population so large, yet exalting the individual, granting equality to all, and vouchsafing freedom and happiness to every one who accepts our principles and abides by our laws.

AMERICAN WEEDS IN ENGLAND.

WE are so familiar with the spread of foreign weeds in this country that we are sometimes half inclined to believe that there must be some special power of attraction on this side the Atlantic which distinguishes America from other countries. But every once in a while statements appear which go to show that the game is not by any means all on one side, and that, in this regard as in others, we have sometimes given hard knocks as well as taken them.

The rapid spread of the aquatic weed Anacharis Canadensis in the canals and brooks of Europe is a case in point, which has often been noticed. In England and in many places on the Continent this "American Weed," as it is called, has become a perfect pest. It is cordially detested by watermen with good cause. Our common Evening Primrose (Œnothera biennis) is another plant which is now scattered far and wide over Europe. Specially interesting is the spread in the vicinity of London of the common Spotted Touch-me-not (Impatiens fulva) of our brooksides, since the course of its dissemination there can be traced with a good deal of certainty. It appears that the Touch-me-not was cultivated some sixty or more years ago in the gardens of Albury Park in the County of Surrey, whence a small stream runs into the River Wey above Guilford, and this little river in its turn falls into the Thames near Shepperton. Starting from the garden in question, the seeds have been carried by the water current and by barges, etc., throughout the Thames valley, as far down as London. The plant was first seen growing wild in 1822 near Albury, and since then it has completely established itself in so many places that were it not for a knowledge of its history its exotic character would not be suspected.

Another foreign plant abundant in fields and by road-sides just above London, whence it is gradually working its way outward, is the Peruvian annual, Galinsoga parviflora, which is supposed, to have escaped from Kew Gardens in the first instance and is now one of the commonest weeds in the district.

One of the most curious instances, however, among all the known cases of immigration into England is that of a shell fish. The fresh water clam or mussel Dreissena polymorpha, which came originally from Russia on logs of timber, has spread itself almost as rapidly as if it were a weed. It was first noticed at certain docks in London, in 1822, but is now so thoroughly acclimated and diffused that it has even been found in the city aqueducts.

BREVITIES.

A FRIEND writes frem Ostemo, Michigan: "The severe cold has killed the peach buds."

WE would commend Prickly Comfrey to Doctor Bailey (him of Billerica; him of Blount Corn fame) as a fine plant for ensilaging!

ONE of our subscribers who last year tested many different kinds of potatoes, thinks that the St. Patrick and Burbank, if not identical, are closely alike. We have never raised either. It is scarcely possible if they had been the same that Mr. Henderson would not have detected it.

ACCORDING to one of the members of the Elmira Farmers' Club, the cost of making molasses, after the cane is supplied, with small apparatus, is about two cents per pound, or 22 cents per gallon. It was found that it required six hours to crush cane enough to yield 200 gallons of juice. A crusher should, to work economically, do that work in an hour. It appears that the *quality* of the molasses made from Amber Cane is rated with that of New Orleans molasses, to which it is superior for cooking purposes.

IN looking over the catalogues which are now coming in freely and which will be noticed next week, we find that "Cuzco" Corn is still offered in several of them as a great and glorious novelty. Our old readers cannot have forgotten what we have said as to this great corn-humbug; but new readers may need to be advised that it is worthless for this or, so far as can be ascertained, for any other climate. The RURAL sent seed to a dozen different persons in the South and West. All report the same, viz.: that it is substantially good-for-nothing.

IT is said that animals on a sea voyage more often die for want of water than from any other cause. Their deaths are usually attributed to sea-sickness in a stormy time, and to being shook about so roughly by the constant heavy rolling and pitching of the vessel. At such times it is very difficult to water animals, and the duty is consequently much neglected. Thus they suffer in two ways—first by the extra exercise a ship gives them in stormy weather, inducing extra heat and perspiration; second, by obtaining a less quantity of water than usual for drinking at the time they really require much more.

IN the RURAL NEW-YORKER for September 4th last, in an editorial under the caption, "The Drought and the Corn Crop," after a careful comparison of various estimates and accounts of the growing crop, we ventured to prophesy "the aggregate corn crop of 1880, despite the early promise of an immense yield, will turn out somewhat less than that of '79;" giving briefly our reasons for the faith that was in us. In the "Agricultural News" this week, we give a tabulated statement of the past season's corn crop, carefully prepared by the Statistician of the Department of Agriculture, which shows that our prediction "hit the bull's-eye," the crop of '80 being estimated therein at 7,363,353 bushels less than that of '79.

DURING the past week and especially toward its close, there has been a growing excitement in the Chicago produce market. A good deal of interest was shown in wheat, and a strong upward movement occurred in nearly every branch of trading, but especially in provisions. This was due to the enormous demands of foreign trade upon the packing capacity of the Western Metropolis, rather than to any combination to force up prices, although there is an unsupported report that such a combination exists with regard to lard. Hogs have been coming in steadily, but the demand greatly exceeds the supply and prices have been going up from five to fifteen cents at short intervals. Last year the state of the market was feverish, with prices controlled by a powerful ring; now prices are steadily mounting as the natural outcome of national prosperity and of a demand in excess of the supply.

AT last the attention of the country seems thoroughly awakened to the danger our herds are exposed to from pleuro-pneumonia. The injury to the country from the restriction on the importations of American cattle into the United Kingdom is trifling in comparison with the calamitous loss that must be incurred should the plague spread among the vast herds of the West and Southwest. Owing chiefly to the repeated warnings of the agricultural press, and a good deal to the action of the Agricultural Department, Congress has at length before it a bill designed to check the spread of the pest, and stamp it out wherever it has obtained a foothold. The Legislature of this State has promptly appropriated another sum of $10,000 to extirpate it from among us, and other States seem fully alive to the emergency. In view of the energetic crusade that will probably soon be inaugurated against the plague everywhere, it is hardly likely that the English Privy Council will adopt any more stringent measures against the importation of cattle from this country, although last Thursday a motion was made in Parliament to prohibit absolutely the landing of American cattle in the United Kingdom on the ground that slaughtering them at the ports of debarkation was not sufficient to prevent the spread among the native herds, of the disease from animals suffering from pleuro pneumonia.

For Women.

CONDUCTED BY MISS RAY CLARK.

THE CHILDREN.

FOUND IN THE DESK OF CHARLES DICKENS AFTER HIS DEATH.

When the lessons and tasks are all ended,
And the school for the day is dismissed,
And the little ones gather around me
To bid me "good-night" and be kissed;
Oh, the little white arms that encircle
My neck in a tender embrace!
Oh, the smiles that are halos of Heaven,
Shedding sunshine and love on my face!

And when they are gone I sit dreaming
Of my childhood, too lovely to last;
Of love that my heart will remember,
When it wakes to the pulse of the past,
Ere the world and its wickedness made me
A partner of sorrow and sin,
When the glory of God was about me,
And the glory of gladness within.

Oh, my heart grows weak as a woman's,
And fountains of feeling will flow,
When I think of the paths steep and stony
Where the feet of the dear ones must go:
Of the mountains of sin hanging o'er them,
Of the tempests of fate blowing wild;
Oh, there's nothing on earth half so holy
As the innocent heart of a child!

They are idols of hearts and of households,
They are angels of God in disguise,
His sunlight still sleeps in their tresses,
His glory still beams in their eyes:
Oh, those truants from earth and from Heaven,
They have made me more manly and mild,
And I know how Jesus could liken
The Kingdom of God to a child.

Seek not a life of the dear ones
All radiant, as others have done;
But that life may have just as much shadow
To temper the glare of the sun:
I would pray God to guard them from evil,
But my prayer would bound back to myself;
Ah! a seraph may pray for a sinner,
But a sinner must pray for himself.

The twig is so easily bended,
I have banished the rule and the rod;
I have taught them the goodness of knowledge,
They have taught me the goodness of God.
My heart is a dungeon of darkness
Where I shut them from breaking a rule;
My frown is sufficient correction,
My love is the law of the school.

I shall leave the old house in the Autumn,
To traverse its threshold no more,
Ah! how I shall sigh for the dear ones
That meet me each morn at the door.
I shall miss the good nights and the kisses,
And the gush of their innocent glee,
The group on the green and the flowers
That are brought every morning to me.

I shall miss them at morn and at eve,
Their song in the school and the street,
I shall miss the low hum of their voices,
And the tramp of their delicate feet.
When the lessons and tasks are all ended,
And death says the school is dismissed,
May the little ones gather around me,
To bid me "good-night" and be kissed.

DESCRIPTION OF CUTS.

FIG. 50.—BORDER EMBROIDERY.

This design is intended to be used for trimming dresses; it is worked with silk in chain-stitch and small jet beads.

FIG. 51.—TRIMMING: CROCHET AND MIGNARDISE.

As will be seen from the illustration, this pattern is worked diagonally.

Commence with twenty-one chain, pass over five chain, one treble into the sixteenth, keep the top loop on the hook for the next and following trebles, turn the cotton twice round the hook, work off as for a treble, leaving the top loops of each on the hook; the trebles are worked into every other stitch of the chain; take a length of mignardise, * work a treble as before described into two picots together, repeat them * three times more, work an ordinary treble into the two next pieces together, then work off each loop on the hook as one stitch.

2d row: Four chain (as all the trebles are worked as described in the last row, we shall not repeat the directions), pass over the first treble, one treble into the top of each of the six next successive treble, one ordinary treble into each of the eight next successive stitches, and one into the two next picots of mignardise together; keep the top loop of each on the hook, and work off as described in first row.

3d row: Four chain, pass over the first treble one treble as described into each of the five next successive stitches, one ordinary treble into each of the eight next successive stitches and into the two next picots of mignardise together; work off as described for previous rows.

4th row: Four chain, pass over one treble one treble as described into each of the four next successive trebles, one ordinary treble into each of eight next successive stitches and into the two next picots of mignardise together; work off the same as previous rows. Repeat from the first row, working into the stitches of last row instead of into the chain, as described for first row.

FIG. 52.—Home dresses for young ladies from twelve to fourteen years of age, is of myrtle-green cashmere, woven striped borders of dull red; it is trimmed with a kilting, and scarf draperies fastened at the back under a bow of ribbon.

The other is of hair-brown vigogne; it is trimmed with two deep kiltings; collar and scarf drapery of woolen plaid.

FIG. 53.—MUFF.

The muff is of chocolate satin, gathered in small puffs; it is lined with old-gold satin, and is trimmed with coffee-colored lace and loops of ribbon.

FIG. 54.—PELERINE.

The pelerine is of black satin, trimmed with a narrow gold embroidery design, and black lace, embroidered with colored floselle.

FIG. 55.—RUFFLE.

The ruffle is of cream-colored lisse, encircled by a wreath of pale pink and blue flowers; it is finished in front by loops of pale blue ribbon and drooping flowers.

FIG. 50.

FIG. 56.—INSERTION: DARNED NET. (BRETON LACE.)

This lace is very much used for trimming evening dresses, fichus, cravats, &c., and it is especially effective when worked with colored floselle upon white or black Brussels net. The design must first be traced upon transparent linen or paper. The net should be firmly tacked over it, and the pattern worked to tracing. The open holes are made by sewing over two or three meshes of the net, and then outlining in darning stitch; all the remainder of the designs is worked in darning-stitch. When the lace is required to be washed, it should be worked with white linen flossette on white Brussels net.

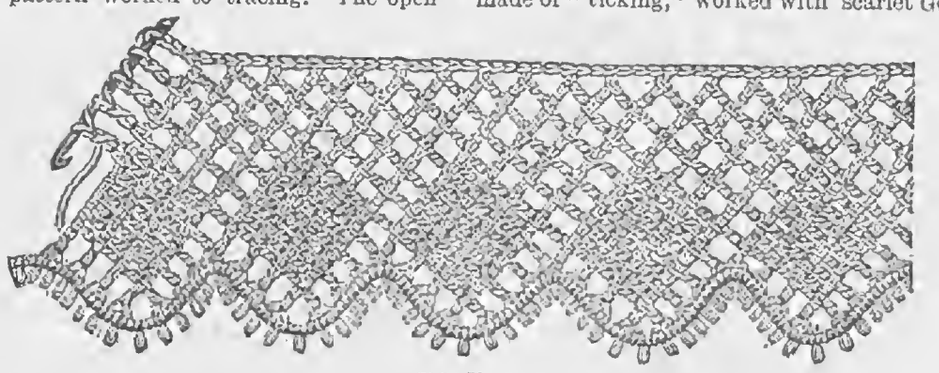

FIG. 51.

FIG. 57, 58.—SPRAYS: EMBROIDERY.

These sprays are worked in long and cording stitch, with crewels or embroidery silk; they are suitable to be dotted about antimacassars, cushion covers, work-basket-covers, &c.

FIG. 52.

FIG. 59.—POMPADOUR SATCHET.

This satchet may be made in a variety of pretty materials, such as satin, velvet or plush. The one illustrated is of olive silk, ornamented with a ruby velvet applique design; it is finished with cord and rich fringe, and is suspended from the waist by means of a double cord of silk.

A LETTER.

DEAR MISS CLARK:—Many obligations to Mary Wager-Fisher for her directions for constructing a "Japanese quilt." I wish every one of the ladies of the RURAL would give directions for making some useful or ornamental article, for there are sure to be some to whom it would be new—whatever may be written upon—even if familiar to many.

Just now I can think of nothing but *bed-ticking* and some of the uses to which it may be put. By working the white stripe with some colored wool, in cat-stitch, you have a handsome cloth.

An acquaintance of mine has a pretty scrap bag made of "ticking," worked with scarlet German-town wool, the edges whipped together and bound with scarlet skirt-braid; a tassel made of the wool fastened on each end of the four corners at the top and one on the bottom, and suspended by a piece of the braid.

Another useful article is a shoe-bag that was hung on the inside of a closet-door; a large square of the ticking was worked with dark-red wool and bound with braid to match; then there were six smaller squares worked and bound like the large one and firmly sewed on it, three squares above and three below. It was pretty and useful for slippers, best shoes, rubbers, etc.

Several years ago I met a young lady from Nashville, Tenn., who was the possessor of a handsome wardrobe. She frequently wore for street wear a short, double-breasted basque of navy-blue, the collar, cuffs, pockets, etc., being of plush the same color, and a double row of large white pearl buttons. The cloth was different from anything we had seen, and what was our astonishment to learn that it was "nothing but bed-ticking."

A couple of Winters after that they were "quite the rage" among the school girls in our city, and I worked one for my sister, in dark purple, making the collar, etc., of cashmere the same shade. It was very much admired. Those worked in cardinal colors, however, are the handsomest.

In making anything of the kind, the article must be cut out, merely allowing for deep seams, as it does not readily ravel. "Grandmother" writes such good articles, can she not tell how to make something pretty and useful?

Hastily, MRS. W. V. A.

IS THERE ANY MONEY IN IT.

ANNIE L. JACK.

A NEW neighbor made us a call of ceremony the other day, and of course we discussed the usual topics that int rest our sex.

Coming from a country village where the people think themselves advanced, because they are replete with social gossip and live in communities, she chafed against the isolation of our quiet life. Having no taste for reading she has a house full of fine furniture but without any books. We made various but vain attempts to enter into a conversation on any subject we could think of, but resigned ourselves at last to an unlimited account of the small details of her past village life. Our eldest daughter was painting our Christmas cards, having bought the plain gilt edged cards, and arranged her own designs, with appropriate sentiments. We thought this, while good practice, would add to their value to friends, and had amused ourselves some dull December afternoons devising appropriate mottoes for the different recipients. Our visitor with the slightest possible show of attention examined the work and then turning to me, asked in a half scornful tone, "Is there any money in it?"

The question has occurred to my mind a great many times since, in view of the many ways in which people spend their time. While I admire the farmer's wife, who while her husband is struggling and poor, bears her share of the burden, and helps him to the independence they both desire, I cannot agree with the grasping spirit, that after competence is gained, continues to feel that the life is "more than meat, or the body than raiment."

"We could live on the interest of our money" my visitor took pains to inform me, yet she had brought up her daughters without a single accomplishment and took only the local weekly newspaper; not one magazine, or horticultural journal with which to brighten and improve their leisure hours.

It is this bareness of living, that helps to drive the youth of the rural districts to the city, and robs the country of its attractiveness. And so high and low, rich and poor, bow down to the golden calf. But be not misled, oh, prudent housewife! to look for your happiness in wealth gained at the expense of all else life has to give; for that which gives us most pleasure, and lasts longest in our memory—the gift we prize most, and the treasure we hold in highest esteem—is likely to be something with no "money in it."

REMODELING.

THE full last years style of polonaises make over very easily and are much less trouble to drape and fit than when made new.

The gray or drab ladies cloth I shall describe was originally made up with black velvet, which was put on in revers and a vest front. It was very full, drooping in the back.

The back is cut princess and long enough to reach the top of the shirt flounce or about 32 inches in length from the waist. The seams left open 10 inches at the bottom and faced with the cloth. The side seam trimmed with velvet revers. The vest is cut off at the waist and a wide velvet belt sewed in the seams of the second dart and passing over the first, finishes the bottom of the waist in front. The front of the polonaise below the waist is cut, in the form of a coat—leaving a wide apron shaped drapery that is slightly full and fastened in with the side seams to cover the under skirt. The front breadths of the polonaise are trimmed also with revers. The front breadths are of a uniform width from the waist to the bottom of the polonaise, and fit smoothly and without draping anywhere. A velvet trimmed under skirt finishes the suit.

A Turban to match the dress made of ¼ yard black velvet and ⅛ yard black or drab satin is easily made by any one at all used to "doing for themselves." Take an old bonnet, shape and cut the size required for the band, and put a full crown of any stiff material or bonnet net, and sew the wire that was on the old bonnet around it to keep it in shape. Put the satin in the crown exactly the same way and size as the net, and roll the velvet around the band. To take away the stiff look, bend the wire into "crooks" our little milliner called it, and pinch in the crown. There will be enough velvet for a loop or two. An ostrich tip will finish it beautifully. MRS O. W. D.

REPLY TO OLD MAIDS.

DEAR me! what a letter from Alline Ray; the replies she makes to the "Old Maid No 2," and Dr. A E. S., must amuse the readers of the RURAL. It seems that Alline Ray has pitched into me and I suppose she is going to drag me over the coals for the answer I made to "Old maid No. 2" and Miss Irene.

Now Alline, you say "just wait until Dr. A. E. S., and old maid No. 2 are twain." I must say in reply that I desire you to know that I am not in haste to marry. I am strongly inclined to believe that your husband is like the one you suppose I will be when No. 2, and myself are one, so you had better drag him over the coals and teach him

common sense and then relate your success to the RURAL sisters.

There are no farmers in Delaware that need reforming. I presume you are of some Eastern town as your ideas are very poor indeed in regard to farmers wives; they usually dress well and the majority of them are always in good health and cheerful. Alline Ray tells the RURAL sisters that Dr. A. E. S. will be faithful and kind until he gets married. Indeed Mrs. Ray I am not a farmer, neither the kind of man you speak of in your letter.

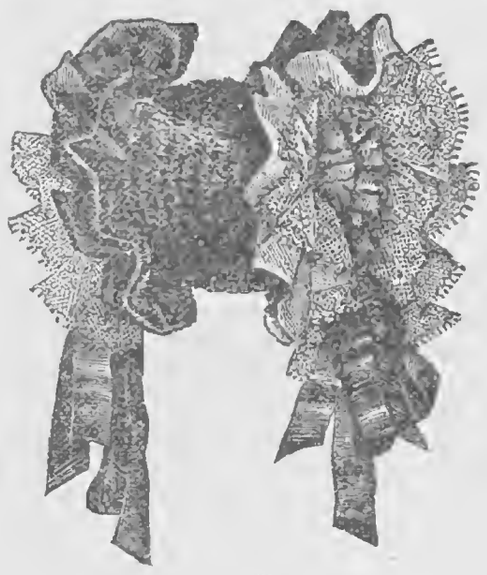

FIG. 53.

As I am not in the farming business, I am not able to give you any ideas for making tomato catsup. No. 2 and myself, neither of us have high tempers but I suspect that you have. You must not get snarly at "Old Maid No. 2; it affords me satisfaction to know that you are pleased with Miss Irene's letter on dragging husbands over the coals. I hope you and she will live to enjoy a a vigorous old age. I also hope to hear from you again on the "coal dragging." Yours truly,

Delaware. DR. A. E. S.

FASHIONS.

FOUR-LEAF clover is one of the favorite designs for jewelry.

The latest handkerchief is of deep brown, with a gold-colored border.

Opal-tinted plush is used for many opera bonnets.

Gloves for the deepest mourning are of undressed kid.

Bouquets of tulips, or of holly, or else of poppies, are chosen to wear in the corsage of black dresses.

Fans at weddings are carried by bridesmaids, ornamented with silver monogram, the initials of the bride and groom, and with each lady's Christian name painted on them.

New pocket handkerchiefs of sheer linen lawn have the initial in hemstitching, usually in block patterns. The hems are either very narrow or else of medium width.

FIG. 54.

A new material for evening and home wear is a serged flannel, made only in white. It is trimmed with white satin ribbons. For young girls and young married ladies it is exquisite.

Kerchiefs of black bernani, edged with fringe, are worn with mourning costumes.

Crochet buttons are preferred for black silk costumes.

Combs, if worn at all, are now placed on the left side of the head.

There has not been a Winter for years in which warm-looking dresses are so fashionable.

The French custom of ornamenting reception rooms with flowers is coming into use in New York.

Black satin reticules are considered in better taste than any other. They are fastened to the belt by a fancy brooch.

Pond lilies embroidered on blue or peacock blue velvet make the prettiest of sofa cushions.

There are rumors in the air that the coiffure is to be high again. Possibly powder may return with the revival of the antique in costumes.

Stamped velvet is a good deal employed for the princess cut of dress, but has a less dressy effect than the plain velvet when used in black.

The prevailing style—and it is to be admired—is for severe plainness in street dress. Materials can be of cloth, but the fit must be perfect.

A corsage bouquet is always pretty, and among recent novelties gilt wheat ears are shown, mixed with lace and bows of fine Indian mull, to be worn at the neck. Quantities of lace are twisted around the neck, either white or black, and the dressing of the neck is now entirely to one's own fancy and as one's own good taste dictates.

Small muffs are a marked feature of Winter costumes. They should be made of the material of the dress and edged with frills of lace. Some shapes are like a hand bag scantily drawn up with heavy cords and tassels. The opening at each side is trimmed with lace, as is the top of the bag. Flowers may be used as ornaments.

Many of the richest brocades of velvet on satin have the velvet flowers edged, veined, and ribbed with gold, jet, or iridescent beads.

CORRESPONDENTS' CORNER.

WILL you please explain through the "RURAL" the "Eastlake," style of lambrequins. I never have seen any and would like to understand the style. COUNTRY GIRL.

ANS.—The "Eastlake" style is perfectly strait. Lambrequins made after this pattern differ from others in the absence of scollops, points, etc. They may be ornamented with fringe or other trimming.

WILL you kindly reply to the following particulars:

Which in your judgment is the best family Encyclopædia, also second best and expense of each. I would also like to know the expense of a *fine* steel engraving of the "Madonna." Is it "artist's proof" that are considered finest? Could you procure one for me if I desired?

Will you mention some engravings or photographs pretty for parlor decoration, and their cost. What books after a Dictionary and Encyclopædia would you recommend as a *foundation* for a family library? I will be grateful for answers.

Mo. E. A. W.

ANS.—As far as possible, allowing for individual taste, etc., we comply with the above request.

If not answered to the letter we hope to confer some benefit.

The best Encyclopædia is Appletons' costing $96. It comprises 16 volumes at $6 each.

Another is published by the American Book Exchange, costing $11 50. Price of engraving of "Madonna di San Sisto" by Raphael $7.50. "Murillo's Madonna" are inferior copies costing $2.50. Artist's proof are always the first that come from the plate and of course are much the best. Only a few are printed—rarely exceeding two-hundred—and it is almost impossible to get an artist's proof of some engravings at any price; in any case they are more expensive. Night and Morning, by Lansier, The Seasons and R. Ansdell's engravings all costing about $3.00 are among the many that might be mentioned for parlor decoration.

FIG. 55.

Macaulay's History of England, Guizot's France, Green's Short History of England, "Analysis of Government" by Bancroft (very useful), Dickens's novels such as "Bleak House," "David Copperfield," "Pickwick Papers," etc. Mrs. D. M. Craik's novels, "A Brave Lady," "Young Mrs. Jardine," "John Halifax," etc., are a few of the many good productions worthy of place in a family library. The Bible of course should be remembered.

We will accommodate by procuring the engraving should it be desired.

WILL you, as soon as convenient, tell me through the RURAL's columns of a pretty way to make up all wool dresses for a little girl eleven years of age? I have plaid stuff for trimming—would like a late pattern. Do young girls wear the hooded costumes. An illustration makes it plainer to us than almost any amount of verbal description.

MRS. F. B.

ANS.—In the current issue we give an illustration which we think will meet your requirements. Young girls do wear the hooded costumes. In a future issue will be given a cut of hood.

WILL you please tell me through "Correspondents' Corner" of the "RURAL NEW-YORKER," where to address Wilkie Collins, the novelist, and oblige a friend? J. J.

Va.

ANS.—Address Wilkie Collins, care of Chatto and Windus: Publishers, London, England.

ABOUT WOMEN.

MISS MARION MURDOCK, formerly a student of the Northwestern Female College, and a graduate of the Boston School of Oratory, has acquired an enviable reputation as an elocutionist in Iowa and Minnesota. She has been engaged with Superintendent Parker in conducting a teachers' institute at Independence, Iowa.

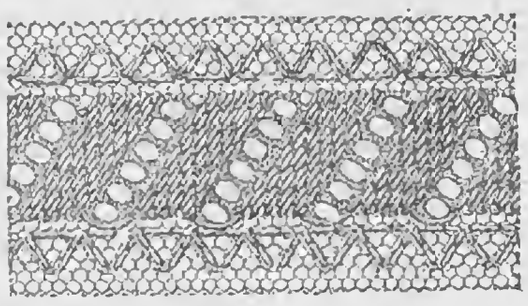

FIG. 56.

MRS. HAYES possesses an art for entertaining her guests which is worthy of study. With a dozen guests on her hands and others constantly arriving, she is always mistress of the situation. Although full of animation, yet she is cool and self-possessed. Her eyes do not wander while engaged in conversation with a single individual, yet she appears to know the movements of every one in the room. She is very ready in conversation, always leading, and very frequently contributing more topics and comments than any one present. She entertains, and does not exact entertainment from her guests.

Literary Miscellany.

ADVENTURES OF AN ANTEDILUVIAN

In The Land of Promise.

BY JAMES M'NEILL.

CHAPTER I.

A STRANGER IN A STRANGE LAND.

WHEN I was a young man I gave much attention to sociology and all questions relating to the amelioration of man's condition as a physical, moral

FIG. 57.

and intellectual being. I had a young friend who was much given to disputation, and we often met for the purpose of exchanging our ideas on the important topics connected with man's relations to his fellows, and to the other beings and objects of the world in which he has been placed.

On one occasion our discussion was unusually vigorous and prolonged. My friend had come to my room early in the evening, and the hour of midnight found us still in hot debate, with no more prospect of unanimity than when we first began. He left me at one o'clock, having risen to go at twelve, with the promise of continuing the discussion when we should meet again.

With my brain tired and feverish from the prolonged mental excitement, I threw myself in my easy-chair to gain some degree of mental composure before attempting sleep. But the stimulus to my intellectual faculties being removed, the reaction seemed to throw them into a whirl of confusion. There was a ringing in my ears, as though the echoes of our voices remained about the walls of my room. I felt a strange, benumbing insensibility stealing over me, and in my efforts to overcome it everything in the room seemed to be whirling about me, and my mental confusion was only increased. The restful quiet of this benumbing feeling seemed so grateful that I soon ceased to struggle against it; as I sank under its influence I seemed to awake suddenly to consciousness in the brilliantly lighted street of a most magnificent city. I looked around me, dazzled and bewildered. It seemed as though some dream of enchantment had suddenly become a reality, and that I enjoyed the rare privilege of conscious existence and its captivating scenes.

FIG. 58.

Having become accustomed to the light, and recovered somewhat from my bewilderment, I began to look about me with an observing eye.

The street was very wide, with a row of grand old elms running through its center. Between them fountains were playing and beautifully-sculptured statuary were placed at frequent intervals. The pavement was the most perfect that I had ever seen, and fairly shone with cleanliness, having, as I afterward learned, been just washed by the water of the fountains, which it was the custom to turn on every evening with sufficient force to carry away every impurity.

As I walked along I noticed that pleasant residences with ample grounds were interspersed among the places of business. This surprised me somewhat, as in my travels (though I had never seen anything to compare with the magnificence of this street) I had found that any which approached it were the thoroughfares of wealth, fashion and dense population. I passed into another street, and from that into another, and still the same general features of the first were presented to my view. Grand old trees, sparkling fountains, beautiful statues, elegant dwellings, and stores brilliant with their display of goods; while everything gleamed with that brilliant light which, though artificial, nearly rivaled the sun in brightness.

There were few persons on the street, but the appearance of those whom I met struck me forcibly. Finer men and women I had never seen. They seemed the very embodiment of physical perfection, while from their countenances shone an intelligence, a purity and a benevolence of character which seemed to indicate that their minds were as completely and harmoniously developed as their bodies.

I had an opportunity of observing the people of this enchanted place more at their leisure, and under more favorable circumstances, as I now came to a spacious and delightful park, in which groups of men, women and children seemed to be enjoying themselves in social pastimes. I was sufficiently surprised and delighted with what I had already seen, but when this magnificent scene burst upon my view I felt as though I would like to sink into the earth from a sense of my own inferiority and insignificance. Still there was a fascination about the scene which riveted my attention; so, keeping myself as much as possible in the shadow of the trees and shrubbery, I endeavored to contemplate the scene with the eye of a curious stranger.

The place seemed to combine the best features of the conservatory and the pleasure ground. Rare plants and flowers, tastefully arranged in clusters and beds along delightful avenues, bloomed in tropical luxuriance. Here a fountain bubbled up from the center of a pile of rocks, and flowed over their moss-grown sides. There, a cascade leaped from a lofty cliff, and dashed along a foaming brooklet till its waters became quiet in the bosom of a peaceful lake. There were caves, grottoes secluded nooks, valleys and hillocks, fountains, statuary, and a thousand curious objects from nature's laboratory, all arranged with such picturesque effect that they afforded the mind one continual feast of wondering delight.

I sat down upon a rustic bench to feast my eyes upon the heavenly scene. There were few people in this portion of the park, but those who passed me, gazed upon me with a curious, and I thought a pitying look. At last an old man of venerable and benign appearance, but erect and vigorous in body, paused in front of me as he was passing and addressed me.

FIG. 59.

"I beg your pardon, sir," said he, "for intruding upon your thoughts, but you seem to be a stranger, and, judging from your appearance, I fear you are ill."

"I feel myself, indeed, a stranger here," I replied. "As much so though I were an inhabitant of the moon just dropped to earth, or rather an inhabitant of the earth suddenly landed upon some delightful planet. As for being ill, my appearance has deceived you, for I never felt better in my life. May I ask, sir, in what place I am?"

"This, sir," he replied, "is one of the parks in the city of Goodwilltomen."

"Goodwilltomen!" I repeated. "I do not remember to have ever heard of a city by this name. Where is it located?"

"In the land of Peaceonearth," he replied. "But come sir, let me introduce you to some of our people. We never allow strangers to be so long in this country."

"You are very kind," I rejoined, "but while feeling truly grateful for your kindliness, I must beg to be allowed to continue a stranger for a while yet.

To tell the truth I felt oppressed with a sense of my great inferiority in the presence of these superior beings. I however acquiesced in the proposition of the old gentleman to accompany him across the park to where the people were engaged in their evening recreations.

"This is but one of the many pleasure grounds," said he, in answer to my inquiries, as we walked along, "which are laid out at regular intervals throughout the city for the purpose of giving the people convenient places for social meeting and pleasant recreation. These parks are frequented at all hours, but especially in the evening it is the custom of our people to meet together for a few hours of social intercourse."

We now drew near where the people were congregated. Embowered amid the trees and a tropical luxuriance of lesser foliage, with silvery cascades and sparkling fountains glistening in the brilliant electric light, there were numerous pavilions and rustic arbors in which various social entertainments were in progress.

We came first to a pavilion in which a company of children were engaged in a game, which, while affording them an infinite amount of merriment, seemed to be wanting in that rude and boisterous hilarity which I had so often observed among children at their games. I was always very fond of children, but this group interested me beyond any that I had ever seen. I had often gone into ecstacy over a plump, healthy, sprightly, and sweet-tempered child, but here were at least forty of such children all in one company, so it may be imagined that I was full of appreciation.

I looked over the company, and narrowly observed each little one, but I could not discover a single one of that pale, nervous, sickly, or gaunt and tall class which is always so well represented in every gathering of children in my own country. On the contrary, they were all so well grown, so finely developed and so healthy in appearance that, but for their number and the variety in their more prominent features, I would have taken them all to be children of one parentage. What was more delightful to me than any other feature of the scene was the unvarying courtesy and the unselfish respect for each other's rights and feelings with which their sport was conducted. They bore themselves like perfect little ladies and gentlemen, while acting with the unconventional freedom of children.

We came next to a large pavilion in which a company of young men and maidens were engaged in such miscellaneous pastimes as might be observed among a social gathering of young people in my country.

Here was a group seated around a table engaged in a game of chess, there a knot was gathered round a work of art, discussing its merits and admiring its beauties. Another group seemed to have in their possession some curiosity which greatly excited their wonder and admiration. Others were promenading, and others still were engaged in earnest conversation, while here and there a couple moved or set apart from the rest, whose tender looks and countenances suffused with an internal content and pleasure told the old story as plainly to the observer as their lips would utter it to each other. The middle of the floor was occupied by many sets of dancers, who moved with the utmost precision in complicated evolutions to the most delicious music that ever greeted my ears. I gazed in rapture upon the moving figures; such beauty of form and grace of carriage seemed little less than divine. While the absence of that ostentatious display of finery and those affected ways by which so many young people attempt to lighten their charms, seemed to set off to the best advantage those graces with which they were all so richly endowed by nature.

"Surely, sir," said I, turning to my companion, "this must be an exhibition of the best specimens of your people gathered from all parts of the country."

He looked at me in mute surprise, while his expressive countenance seemed to say: "Surely, sir, your mental equipoise must be seriously disturbed or else you are woefully green."

"Now, in my country," said I, in an explanatory manner, "there could scarcely be collected so many splendid specimens of young men and women as are here assembled, while if they were gotten together people would come by tens of thousands to see them."

"Your country," said my companion, smiling facetiously, "must be in a very out of the way place, where it remains unaffected by the progress of our age. This company of young people is by no means remarkable, but such as might be found at this moment in any of the many parks of the city. And, further, I would agree to travel with you over the whole extent of our country and find you in every section of it as fine looking men and women as the best of those who have here excited your admiration."

"Indeed, sir," said I, "I grow each moment more insignificant in my eyes; and yet I must see more of your wonderful country and people if I dwindle to the condition of a miserable, deformed pigmy."

"I hope," replied my conductor, a benevolent smile lighting up his noble face, "that your visit among us will have a directly opposite effect, namely, to inspire you with loftier aspirations by giving you visible proof of what your nature is capable."

"There, sir," he continued, pointing to a venerable looking man whose magnificent head and face at once riveted my attention, "that is Professor Cameron. He is explaining a recent discovery which he has made in electro-magnetism to some of his scientific friends. If you want to study a really fine specimen of the human race, look at him. In his younger days he was regarded as the finest man both physically and mentally, that the city contained. He has not lost any of his mental energy yet, while he is as hearty and fresh, physically, as many a man of a hundred."

"A hundred what?" I mechanically inquired.

"A hundred years of age. I know you will scarcely believe me, but that worthy man is one hundred and thirty years old, and he has every prospect of living to be a hundred and seventy."

"Indeed," said I, "then longevity is another of the remarkable characteristics of your people."

"I do not know that you can call it a remarkable characteristic of our people," he replied, "since it is only occasionally that one reaches a hundred and seventy. While the average of human life among us is only one hundred and twenty-five. Doubtless, in the course of time it will improve, as the people learn greater self-control and the laws of hereditary transmission become more thoroughly obeyed. In my young days the average was only a hundred and ten, now it has reached a hundred and twenty-five, and I should not be at all surprised but that in two or three generations more, it will have reached a hundred and fifty."

At this juncture a chime of bells rang out a most delightful piece of music. Immediately the play of the children, the dancing, the games, and every other occupation at which the people were engaged, ceased, and they all stood up in their places and became reverently silent. Then a choir in a conspicuous pavilion led off in a hymn of praise in which all the people joined. And such a hymn of praise, I thought, never swelled to heaven. In the pauses of the hymn I could hear the chimes and voices of other quarters of the city, and I conjectured, as my companion afterward informed me, that this was the closing exercise of the social entertainments in the different parks throughout the city. Promptly at nine o'clock, the chimes began to ring and then, after the hymn of praise was sung, the people dispersed to their homes.

My companion gave me a very pressing invitation to become his guest, but I politely declined, and requested him to show me to the nearest hotel. This he consented to do with hospitable reluctance, and following in the wake of the populace from the now deserted park, we soon parted at an elegant hotel.

I stepped up boldly to the register among a crowd of those who had just returned from the park. I felt that I was an object of no very flattering curiosity to the grand people among whom I had fallen, and I resolved to show them that I was indifferent to their criticisms. My bold, confident air must have caused them much amusement, for they might justly consider me a mere pigmy both in mind and body, as compared with themselves. Yet I could not discover a disposition on the part of any of them to resent my assumption of importance. Even the hotel clerk, proverbially scornful to the man of indifferent appearance, treated me with the utmost courtesy.

The guests had soon all retired, it being an invariable rule with this people to be in bed by ten o'clock—and I found myself alone with the clerk and other employees of the hotel who seemed preparing to follow the guests. I felt jaded, dispirited and generally dissatisfied with myself, and as I had often found beneficial results in such a condition, from a glass of brandy, I inquired of the clerk where the bar was.

"The bar!" he repeated with a puzzled look. "There is probably one out in the storeroom; but I cannot conceive what use you can have for a bar. Is it an iron or a wooden one you want?"

To be continued.

THE EYE-OPENER.

THE excellent Report of the Kansas State Horticultural Society, just received, says that at its ninth semi-annual meeting frauds and humbugs received the strongest condemnation. The proprietors of the Hill Home Nurseries, of Tadmor, Ohio, and of the Rose Hill Nurseries, of Iowa City, Iowa, were specially scored for their efforts to swindle the people of Kansas with such frauds as the Conover's Seedling Grape, and statements "meant to deceive" about Hybrid Russian apple trees and many other worthless articles. A fellow named Fulhart was also "handled without gloves" for selling the Lombardy and Broad-leafed Peaches as valuable fruits, and also such frauds as the Sweet Rhubarb, Tree Strawberries, Grape-vine Raspberry, and monster pears, "originating in the swamps of France"!!! The sense of the Society was that sensible men should not be duped by wily agents or by fine-colored fruit books, or even by bottles of specimen fruit grown elsewhere, and if gudgeons are caught by such bait, why, they are apt to learn some wisdom, though they pay pretty dear for the lesson.

At the change of life nothing equals Hop Bitters to allay all troubles incident thereto.

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

CONCERNING THE SAVING OF LABOR.

MARY WAGER-FISHER.

I THINK actual housekeepers, who keep house well, must often be amused at the substance of many of the articles which from year to year appear in the "household" column of newspapers, telling women how to do their work in order to get through with it quickly, have plenty of leisure, and be always bright and unfatigued; for they well know that in housekeeping, as in most other businesses, "eternal vigilance is the price of liberty," and that for every day of neglect there is always a "day of reckoning." At all events, that has been my own experience. I find that, in order to keep affairs running smoothly and well, there is always a great deal of work to be done and always a great many steps to be taken.

In economizing labor, both for myself and those whose work I direct, I aim chiefly at two things—to make the various tasks of the day "dove-tail" into each other, and to *save steps*. The latter, I think, is of very great importance, and the most difficult to compass, because it requires constant forethought. Aside from the architectural conveniences of a house—on which a long chapter might be written—there are some arrangements, simple in themselves, but which contribute largely to "keeping things in order," at little cost of trouble or expense. In the kitchen hang a bag so that the mouth be always open, in which put all rags of every description—especially worn-out house-cloths that drift to that part of the house. Have another bag, with mouth ajar, for paper of every description. Allow *never a rag or paper to be thrown out of doors*. When a broom is utterly worn out, chop off the stump end and put it in the fire; put the handle in the work shop. Have a box or drawer in the kitchen for needles, thread, thimble and shears; they are always needed at times. Have in every occupied room in the house a similar outfit, for scarcely a week passes but a stitch needs to be taken in something. A half dozen steel thimbles, with needles and thread and scissors, judiciously placed, will save five thousand steps a year.

The same may be said of dust-pans and dust-brushes. In a large house there should be from two to three on each floor. They will wear for years, and in the end cost no more than when one is made to do for the entire house, besides saving all the steps. To come down-stairs for what should be up-stairs, and *vice versa*, should be accounted an intellectual sin. True, one cannot always go about with the mind charged with small matters, but there is an old saw about killing two birds with one stone, that is worth remembering. If there is a shelf or chair by the stairway, on which articles are placed that are to go up-stairs, many steps can be saved in that way. The same for the cellar, if there is a shelf put in the cellar-way on which things may be placed temporarily that are either to be carried down or to be brought up, and left until required.

What is needed in the kitchen, have in the kitchen, so far as possible. If there is no place for these things, *make a place*. So of the dining-room. Have your table-cloths and napkins there, and not up-stairs in a bureau drawer. In brief, put the requirements of an office *in the office*, and, as I said of the kitchen, if you have no place for them, make a place. A small cupboard may be hung against a wall, which will prove a great convenience. Instead of talking and wishing for conveniences, *have them*. In nine cases out of ten, if you want a thing in downright earnest you'll get it. Only, never ask to have an extension to the back part of the house when you have front rooms that you don't use! American women have a mania for extensive houses, until they are worn out in their efforts to take care of them.

One way to "get on" with work, and so economize in labor, is to have a goodly number of irons in the fire at the same time. I find that a thing once begun is half done; then, too, one does not always feel like doing certain tasks at all times, and a diversity of work is more pleasant. One may lack materials to finish one article, or a certain piece of sewing is up-stairs and one is too tired to go for it, so, if there is other work at hand already begun, it will probably receive attention. Sewing and repairing for Spring and Summer wear should now be attended to, so that when the warm, relaxing days of Spring come there will be no need of over-work for the sake of having something to wear.

Apropos conveniences, a lamp hung from the middle of the ceiling in the kitchen will light the whole room, be out of the way and out of danger from breakage. Plain hanging lamps are now among the least expensive of lamps, and with a good top piece, or shade, are very useful.

For cleaning frosted lamp globes, wet a bit of cloth in kerosene and rub the glass. Use no water in cleaning lamp chimneys and the breakage of them will be almost nothing. For plain chimneys I know of nothing better than soft paper and human breath. Put the paper over one end of the chimney, blow into the other, which warms and moistens the glass, and then rub with the paper. Some steam the chimney slightly at the spout of a teakettle. Whether the way in which lamp chimneys are cleaned has actually something to do with their breakage or non-breakage I don't know, but I do know that in my own housekeeping the chimneys that are washed with soap and water have to be replaced three or four times as often as the chimneys that are cleaned with steam and paper or with kerosene. Have a shelf on purpose to set lamps on.

Have plenty of hooks all through the house to hang things on—hooks in the hall for hats, coats, rubbers, shoes, and everything wearable that can be hung up; that is, if you can afford nothing better than hooks. In the kitchen hang up everything "hangable." In this way tables, shelves, chairs and the floor will be kept clear of obstructions; you can tell where everything is at a glance, and sweeping, dusting and cleaning can all be done with the greater facility. Four dozen hooks, well screwed in the right places, will prove great sources of convenience and comfort. If bedrooms have no closets, or only small ones, put hooks on the back of the doors to hang night-gowns on, as they should be aired throughout the entire day.

Have a high stool in the kitchen to sit on when tired, to continue your work if necessary. Perched on its top you can wash dishes or iron, clean windows or "can" fruit with ease. A low stool placed in a wooden chair forms a substitute, but a poor one.

I find a carpet-sweeper as necessary as a clothes-wringer. It saves greatly in strength and raises almost no dust at all. I think it wears a carpet *less* than do brooms. It costs about $3.00, and will last a great many years. A child can operate it.

DOMESTIC RECIPES.

Soft-Soap.

PUT one and one-half pail of lye that will bear up an egg into your soap barrel and to it add eight pounds of melted grease, free from sediment. Thin with weak lye as it is obtained from the leach. Stir occasionally. It should thicken and be ready for use in two or three days, providing the weather is warm or the barrel stands in a warm place. This method makes very good soap and it is a saving of time, strength and fuel, which is sufficient to justify one in throwing away the scraps, which may not be quite so thoroughly "tried out," as in the old method. As to the scraps, the best use they can be put to, is to throw them to the hens,—they will repay you.

FARMER'S WIFE.

Rusks.

One quart of light bread sponge, two cups of sugar, one-half cup of shortening and a beaten egg. Make into a soft dough. When very light, roll out an inch thick and cut into rounds. Let rise again and bake in a moderate oven—a heat that will not form a hard crust at top or bottom. These are very nice with coffee or tea. When stale, split them, toast slightly, butter and eat at once.

Soda Crackers.

Fourteen teacups of sifted flour, half a cup each of butter and lard, two cups of milk or water, two teaspoonfuls of cream-of-tartar and one of soda. Mix, do not pound, roll thin, cut into squares, prick with a fork and bake in a moderate oven.

Good Doughnuts.

Seven coffeecupfuls of light bread dough (it should be sponged with milk). Into it mix one and one-half cupful of melted shortening, one of sugar and a teaspoonful of saleratus. When this has again become light, roll it out—not too thick—cut into small squares, or any shape you please, and cook in boiling fat.

Cookies.

Two cups and a half of sugar, two cups of butter, four eggs, half a teaspoonful of saleratus, caraway seed if you please, flour to roll thin. Cut round. MARY B.

Salt in Starch.

"Salt should never be used in starch. Although it gives the linen a good appearance and makes it iron smoothly, it surely destroys the fabric. I have tried it to my satisfaction, and know it is not a fancy." Thus writes a friend.

Potted Meats.

It sometimes happens from unforeseen circumstances, that large quantities of cooked meats remain on hand. How to preserve them is the question many ladies are unable to answer. *Pot them.* Cut the meat from the bones, chop *fine*, in fact, it should be rubbed to a paste, season highly with cayenne, salt, cloves or any spice you like, moisten with melted butter, wine, vinegar, cider or Worcestershire sauce, according to the kind of meat, and pack into small stone jars. Cover the top with half an inch of melted butter and keep in a cool place. It will keep weeks and is very nice for lunch or tea. J. R. J.

Cold Buckwheat Cakes.

If any cakes are left from breakfast, soak them in warm water or milk, rub them *fine* and put with the fresh butter. It is as much an improvement as it is a saving.

Bread from Grown Wheat.

Add several potatoes to the bread—three to each loaf, boiled and mashed fine. It restores the starch and makes excellent bread.

Potato Salad.

Thin slices of cold boiled potatoes, thin slices of hard boiled eggs, minced pickled onion. Into a salad dish put a layer of potatoes, cover with the eggs and strew over a few bits of the onion. This alternate until all are in. Make a dressing in the proportion of one tablespoonful of vinegar to three of salad oil-one teaspoonful of salt to one-third teaspoonful of pepper and the same quantity of made mustard. Mix thoroughly and pour over. Let stand half an hour before eating.

MRS. E. L. C.

NOTE.—The article in a late paper by Mary Wager-Fisher is especially valuable to young housekeepers' and even those of experience may learn something new from its practical hints on dinner-giving. To readers in the country removed from contact with those who see the oft changing style of table etiquette, it is of special value and its perusal cannot be too highly recommended. ANNIE L. JACK.

With children strive to inspire love not dread—respect not fear.

No hospital needed for patients that use Hop Bitters, as they cure so speedily at home.

HOME NEWS.

MONDAY, Jan. 31, 1881.

Public opinion is loud and earnest all over the country against the consolidation of the three chief telegraph companies. Protests from Chambers of Commerce, Cotton Exchanges and other commercial bodies strongly deprecate the resulting monopoly; while the public at large is well represented by the press of the country which, as a rule, is earnestly opposed to the imposition. The consolidation is against the laws of Pennsylvania, which, in giving its franchise to the American Union Company a few years ago, stipulated that it should not be amalgamated with other companies. It is said the law officers will rigidly enforce this provision; but similar violations of the law have been made by other companies—notably by the Pennsylvania Railroad—without legal interferance, and its hardly likely that the law officers will persistently oppose the present outrage unless public opinion forces them to do so. In this State injunctions have hitherto prevented consolidation, but with vast capital and *influence* at their backs, the companies are likely to win. Jay Gould is said to be on the point of clearing $5,000,000 by the scheme; Vanderbilt will net nearly as much; other heavy capitalists will also feather their nests deeply, and they are bound to stick to the measure unless the dominant voice of the People forbids it. Measures looking to its prevention have been introduced into the Legislature of this and several other States, and a resolution has been brought before Congress to investigate the cost of the various telegraph lines under oath. It is proposed by the companies to raise the present capital of some fifty or sixty million dollars to eighty millions, the addition to be pure "water," on which, however, the public are to be forced to pay from five to ten per cent a year, as if it was a genuine investment. Much of the present capital also represents "water;" for it seems that all the lines which will represent $80,000,000 if the "deal" is made, could be built by the Government to-day for from $18,000,000 to $20,000,000,. and public opinion is growing strongly in favor of such a measure as a permanent protection of the people against the unscrupulous greed of capitalists; for it is becoming clearer and clearer each day that *unless where protected by the criminal laws, the public now have no rights which monopolists are bound to respect.*

THE following bills of general interest were introduced into Congress during the week: To construct a bridge over Niagara River.... To print 30,000 copies of the Entigical Report on the Cotton Worm....To assign land to the Indians "in severality"—that is to give each head of a family so many acres to be his own, instead of all having the land in common, as now. The present system is supposed to foster idleness and improvidence, as no one can feel that he is working for himself and his own family....To enable planters to furnish their laborers with tobacco without first obtaining a retail dealer's license. ...To construct a double-track railway from New York to Council Bluffs. This is designed as a competitor against the present monopolies.... To appoint a commission to examine and report upon the adulteration of food. .... On the 25th a bill reported in the Senate by Mr. Johnston, of Va., from the select committee on the subject of pleuro-pneumonia and other contagious diseases of domestic animals, was ordered printed and recommitted to the committee....The bill provides for the organization of a Bureau of Animal Industry in the Department of Agriculture. It authorizes the Commissioner of Agriculture to appoint a chief of this bureau, who is to be a competent veterinary surgeon approved of by the National Board of Health, and whose duty it will be to investigate and report the value and condition of domestic animals and also the causes of contagious diseases among them, and to provide for the prevention and cure of the same. The Commissioner of Agriculture is authorized by the bill to purchase and slaughter diseased animals, provided the sum paid for them shall not exceed two-thirds of the market value of healthy animals. Two hundred thousand dollars are appropriated to meet the expenses incurred in carrying out the provisions of the act....Among other matters discussed either in the Senate or House has been the re-appointment of Gen. Grant to the position of General of the armies, to be retired with full pay, in acknowledgment of his great services to the country; the President being authorized to call him to active duty should the country ever need his services. This was supported vigorously by all the Republican Senators and opposed by all the Democrats except Lamar of Miss. and Judge Davis of Ill., who were in favor of the measure ...The telegraph monopoly was discussed, showing it has many bitter enemies—but then the friends of such rich schemes that can afford to buy men, find it safer and equally profitable to favor them by their votes without calling attention by making fuss about the matter ..... The bill appropriating $500,000 for completing and compiling the Census returns was passed with little discussion... The Commissioner of Pensions has written a letter to the chairman of the Senate committee on appropriations, in which he estimates that more than $500,000,000 will be required to pay all claims under the arrearages of pensions. ....A special Congressional committee has discovered that tons of political matter were sent free through the post office at the last election, thus charging the country with party expenses. Several boxes containing 80,000 documents still remained in the P. O., all of which were sent by Democratic Congressmen, Cox of N. Y., being credited with 52,000. The Democrats were caught this time; but the Republicans probably were just as sinful when they were in a majority....A committee of five has been appointed to look after diseases among live stock....Nebraska has elected to the U. S. Senate, C. H. Van Wyck, a farmer, and, of course, an anti-railroad man. Good for Nebraska!....On Thursday, the "Women Suffragists" had "field day" before the Senate, when a motion was made to appoint a standing committee upon the rights of women—pigeon-holed by reference to the Committee on Rules by a vote of 26 to 23.

The Refunding Bill, after having been for weeks discussed in the House, has finally passed that body. It provides that to pay off the bonds bearing five and six per cent. interest, now amounting to $650,000,000, a batch of new bonds shall be issued bearing only three per cent. interest, to the amount of $400,000, and also $300,000,000 worth of three per cent. certificates in denominations of $10, $20 and $50. Various provisions are attached in order to put these bonds into circulation; for it is hardly believed that capitalists will invest their money in bonds that pay only three per cent interest. The certificates, being for small sums, it is thought will be taken by the people at large as safe investments.

In the Pennsylvania Legislature there has been a deadlock for a week or more over the election of a U. S. Senator. The term of Wallace, one of the two present Senators and a Democrat, expires on March 4, and as the Legislature is Republican, a representative of that party is expected to succeed him. Mr. Oliver, a large iron manufacturer of Pittsburg, was nominated by a caucus of the Republican members of the House and Senate, but a considerable number objected to him so strongly that they "bolted"—refused to abide by the decision of the caucus—and without their votes the Republicans haven't a majority, and so can't elect the "regular" nominee. There are 239 votes, making 119 necessary for a choice. Of these H. W. Oliver has 85 by last ballot, Galusha A. Grow, the "bolters'" candidate, 57, and Wallace 86 solid Democratic votes. The two Republican factions are obstinate: the "Oliverites," because they are "regular," have the majority, are backed by Cameron and the "machine," and hope to win ultimately; the "Growers" because they are anti-machinists, and therefore supposed to represent the steadfastness and all the other virtues of the party....Down in Tennessee there was also, for a week or so, a pretty obstinate deadlock over the election of a U. S. Senator, during which Maynard, the present Postmaster General, came within three votes of being elected; but finally Howell E. Jackson, a State-Credit Democrat, was elected, most of the Republicans joining with most of the Democrats at the close. He is against repudiation of the State debt or any part of it....General W. J. Sewell has been elected U. S. Senator from N. J., to succeed Randolph, the present Democratic Senator. The new man is a Republican, and is said to have been elected through railroad influence, as he has always sided with railroads against all opponents....Wisconsin sends Philetus Sawyer to the U. S. Senate. He has yet to make a name known away from home....A. D. Maxey has been re-elected U. S. Senator from Texas on the first ballot, by 73 votes, against 42 for Throckmorton, 1 for Reagan, all three Democrats, and 6 for Davis, Republican.

Father Purcell, brother of the Roman Catholic Archbishop of Cincinnati, died last Thursday, aged 73. It was he who mismanaged the Bishop's savings bank, which failed for upwards of $3,000,000 about three years ago. Folks are out of their money yet.....Severe storms visited various parts of the country on Friday, Jan. 21st. New England and the Middle States were covered with a thick coating of ice, caused by the freezing of rain as it fell. Hundreds of miles of telegraph wires were broken down and many poles fell under their heavy burdens. Telegraphic communication was suspended between a number of cities. Five inches of snow fell in Mobile on Sunday night. The snow in New Orleans continued to fall during Sunday night and Monday morning, until it lay two or three inches deep on the house tops in the city and three to four inches deep on the ground in the suburbs. It was the heaviest snow-fall in New Orleans since 1852. Snow fell at Augusta, Georgia, on Monday, for eight hours—a thing unprecedented there—but it melted as fast as it fell. The heaviest snow-fall in fifty years is reported in South Carolina, and heavy snow is also reported in North Carolina.....President Hayes has nominated Edward C. Billings, of Louisiana, to be United States Judge for the Fifth Circuit, to succeed Judge Woods, promoted.

The World's Fair Commission are busy "laying pipes" to commence operations. Already nearly $1,000,000 have been subscribed *positively*, and about twice as much conditionally on a certain minimum sum being raised. A lease of the Inwood site of the Fair has been signed, and everything looks as bright as can be expected in such gloomy weather. This fair is to be a national affair, so that the whole country should at once join in making it a national success. After all, that little Philadelphia concern of '76 was really useful—it gave some hints for the Great American Exhibition of '83.....A certificate of the death of Mrs. Sally Hunter, aged 115 years, was received at the Health Office at Washington the other day. Mrs. Hunter was born in Westmoreland County, Va., in 1766, and belonged to the Washington estate, being one of the servants manumitted by the General's will. She lived in that county until the war, when she and her children went to Washington, where she has since resided. This is supposed at Washington to be the last of the servants of George Washington, but we all know that G. W.'s servants are bound to turn up alive here and there for at least the next 50 years.

The Permanent Exhibition at Philadelphia—the *souvenir* of the Big Show of four years ago—is about to be sold and so the concern comes to an end. To keep up a thing of that sort was too much to expect from a provincial town like Philadelphia, especially when our Big Show here is about to dwarf into insignificance the affair of which the collapsed exhibition was a memorial.... ....A bill has been introduced into the Legislature of this State establishing the whipping post for wife beaters. Mr. Bergh, of the Society against Cruelty to Animals is its author. Hitherto, all his efforts have been in favor of brutes; shouldn't he, therefore, in the present case, be on the side of the wife-beaters..... Ben. Franklin's original papers—or some of them—are for sale, and Secretary Evarts advises the government to pay $20,000 for them. ....Congress proposes to spend $3,000,000 for a Congressional library building. If the casket shall be so costly, what must be the price of the inclosed treasures?..... .Judge Swayne has resigned his position as Associate Justice of the United States Supreme Court, on account of old age, and Stanley Mathews, of Ohio, has been nominated by President Hayes, in his place..... This was a foregone conclusion—some are wicked enough to call it a bargain. Mathews was born in Cincinnati in 1824, and is an excellent lawyer. On the resignation of Sherman as Senator for Ohio to become Secretary of the Treasury in '77, Mathews was elected to succeed him as the stoutest of Hayes Republicans. Two years afterwards the Democrats carried the State and Pendleton was sent to sit in Mathews's chair in the Senate. Big hopes were entertained of him as a Senator by his friends and others—the others, at least, were disappointed.

Three ships with fifteen hundred Chinamen for railway work, will arrive at Victoria, in April, and an equal number in June.....At Cincinnati, the Expressmen's Mutual Benefit association adjourned, Thursday. S. M. Shoemaker, of Baltimore, was re-elected President. The executive committee includes T. T. Wallace, of Elmira, N. Y. Sutherland Dewitt, of Elmira, was re-elected Grand Secretary and Treasurer. The next biennial meeting will be in Baltimore..... . At the request of Thomas Hughes, Bishop Quintard, of Tennessee will make the new Rugby settlement his official and private home, and will build a residence in the Spring.

[Indianapolis Daily Sentinel]

No More Gossip.

If we are correctly informed, St. Jacobs Oil is now the usual tea-party topic in place of the former staple—free gossip. How wise and how much more beneficial!

FOREIGN NEWS.

In Ireland the jury that sat at the trial of Parnell and the other leaders of the Land League have disagreed, and all the island, barring parts of Orange Ulster, has been ablaze with bonfires and red-hot enthusiasm. It is hardly likely that the Government will try again to secure a conviction. Indeed, it is not unlikely it is glad to get out of the difficulty in this way. Meanwhile, the principles of the Land League have become more widely known through the trial, and its power been more firmly consolidated. In England the Government has introduced into the House of Commons a bill to coerce Hibernian discontent—or rather the violent expressions of it. It provides for the arrest of all parties in the disturbed districts, against whom there is a reasonable suspicion that they are engaged in measures opposed to public tranquility, and their imprisonment without appeal to *habeas corpus*, as well as their trial by judges instead of juries—in certain cases. Parnell and the other Home Rule Members of Parliament have hitherto prevented action on the bill by their "obstructive tactics," and say they are pretty confident of being able to prevent its becoming a law, unless some unprecedented means are taken to silence their opposition. The "Irish National Directory," a Fenian organization, caused placards to be posted on the doors of chapels, churches, police barracks, etc., throughout the whole of Ireland, last Saturday night, counseling patience, vigilance, and readiness on the people. It is feared that an armed outbreak may occur which would be promptly suppressed. All the armories, dock-yards and other government military and naval repositories, not only in Ireland, but also in Great Britain are guarded nightly lest Fenian conspirators should blow them up or burn them down.

In South Africa Gen. Sir George Colley with upwards of 1,000 men, attacked the Boers in the Drakenberg Pass in the Transvaal, and was completely routed, losing several valuable officers and about 200 men killed beside a large number wounded. The victors are said—by the vanquished of course—to have lost 500. The British garrisons in the Transvaal are in a critical position and will probably be captured. The English Government is hurrying forward reinforcements.....Greece has 80,000 or more troops under arms and threatens immediate war on Turkey. The latter, to placate the great Powers, still seeks their interference; but says sternly that, should Greece begin the war, the Turkish fleet will exercise all the rights war confers, bombard and ravage the Grecian seaports and extended coast, and do a world of mischief. The Greeks are showing much more manhood than it was supposed ages of oppression had left in them. Should the war break out, no modern prophet can foretell where it will end. England being hampered by the Irish troubles, Russia may again "pitch in," in which case it may become a general European scrimmage.

AGRICULTURAL NEWS.

During the four weeks ended November 27th, 66 outbreaks of pleuro-pneumonia were reported in Great Britain, and 165 cattle were attacked. In the corresponding period of last year there were 104 outbreaks reported, and 303 cattle attacked.... ...In Denmark pleuro-pneumonia has broken out among the cattle at Holback in Zealand. Of 47 head of cattle that were killed, five were found to have been suffering from this disease.....In the four weeks ended November 27th, 88 outbreaks of swine fever were reported in Great Britain, and 368 animals attacked. In the corresponding period of last year 190 outbreaks were reported, and 968 animals attacked.....French farmers are extremely satisfied with the present condition of the young wheat. Owing to the mildness of the weather during December, it has acquired sufficient strength to be able to withstand the frosts which have set in with the new year. Field work is also forward, and there is no cause of complaint, except slight inundations in some districts. ....From Banda Oriental the accounts about the wool clip and prospects of the wheat crop could not be better. The wool trade had only begun—out of 250,000 bales, estimated as last year's clip, only about 35,000 bales had been shipped. Prices for wool were higher than in any previous year ....In Queensland, Australia, according to advices of November 20, rains had fallen and the colony was looking well, generally. Shearing was nearly completed, most of the clip being shorn in the grease, and on the whole was considered to be a heavy and a good one. Accounts of the wheat crops were mostly favorable..... A farmers Co-operative Society, for shipping wheat on growers' account to European markets, is projected at Melbourne with a capital of £100,000. The promoters include several members of Parliament .....

Very disastrous stock news comes from the Western plains. The snow is extraordinarily deep, the cold unusually severe, and vast numbers of cattle are reported to have either starved or been frozen to death.....Those imported Jerseys that are affected with foot-and-mouth disease are strictly confined in this city, and will be kept quarantined until all danger from contagion is over. The malady yields slowly to treatment, so that the animals will not be a dead loss—unless they "eat their heads off" before they can be cured.....An importation of three Clydesdale horses belonging to Reeside Bros., arrived at this port a few days ago. .....Last week a batch of Jerseys arrived in Halifax, Nova Scotia, on their way to the Sandwich Islands—Jerseys will soon be dispersed as widely as Short-horns.....Heavy rains are telegraphed from the Vuelto Abajo district in Cuba. The tobacco crop, it is said, will be heavy, but mostly of a light description suitable for the European market.....A new manufactory for making sugar from beets commenced work near Wilmington, Delaware, about New Year's. The beets thus far received produce from 8 to 14 per cent. of saccharine matter, and cost the company from $3.50 to $4 per ton. Fifty tons per day are worked up. The company propose to work by a "new and improved process," and expect to produce 275 tons of raw sugar, 100 tons of molasses and 1,700 tons of pulp, the latter worth $1 per ton for cattle food, in 1881.

The following is the statement of the corn crop for this year as compared with last year's, made by Col. C. Worthington, Statistician to the Department of Agriculture. It has only just reached us.

	1880. Bushels.	1879. Bushels.
Maine	1,800,000	1,585,950
New Hampshire	2,309,800	1,857,895
Vermont	1,847,700	2,037,950
Massachusetts	1,472,200	1,886,000
Rhode Island	277,200	268,800
Connecticut	2,218,500	2,218,500
New York	24,602,500	22,705,650
New Jersey	11,458,500	8,970,560
Pennsylvania	66,880,900	44,605,650
Delaware	5,760,000	4,560,000
Maryland	16,907,100	12,720,428
Virginia	25,027,800	19,957,600
North Carolina	27,518 000	25,677,300
South Carolina	11,660,100	9,702,200
Georgia	19,181,200	20,627,400
Florida	2,237,900	1,945,820
Alabama	21,162,650	25,403,560
Mississippi	22,745,600	24,926,730
Louisiana	16,307,900	12,593,800
Texas	70,251,100	59,198,000
Arkansas	26,245 100	22,431,840
Tennessee	48,080 900	50,856,750
West Virginia	11,892,200	11,303,360
Kentucky	51,871,900	64,736,000
Ohio	123,684,300	105,086,350
Michigan	33,165,000	30,943,500
Indiana	111,028,800	134,922,450
Illinois	283,2 5,240	309,220,650
Wisconsin	40,310,100	39,311,940
Minnesota	16,098,900	15,715,000
Iowa	07,202,500	185,19 ,720
Missouri	111,145,800	147,337,920
Kansas	72,426,000	88,719,740
Nebraska	61,381,500	62,458,580
California	3,537,600	2,814 000
Oregon	84,560	142,400
Nevada, Colorado, and the Territories	3,107,8'0	2,750,100
Total	1,537,535,940	1,544,899,293

The production of wool in California in 1880 was 46,074,154 pounds, against 46,903,360 pounds in 1879. The stock on hand in San Francisco December 31, 1880, was about 2,000,000 pounds. The California Spring clip was a good average, while the Fall wools are very poor. The quantity of fine wool seems to increase annually ..... The Mark Lane Express of January 24 says:—The young crops, protected by snow, are doing well. The threshing results show that the crop of 1880 has been greatly overestimated, while the unfortunate harvest weather has evidently ruined the condition of the greater portion. It might be found cheaper, therefore, to malt for cattle the more damaged specimens, instead of marketing it in competition with foreign. Foreign wheat was extremely dull, and sometimes stagnant. The reticence of American exporters is a matter of indifference to British consumers, as higher rates are unwarranted for the future. It appears they have missed their chances. India contributed one-third of the week's shipments, which were so small, on account of the frost, while Austria, Chili and Russia are exporting.

The peach-buds on the Peninsula have just gone through their annual experience of being killed—if the growers' reports are to be accepted.....It is now considered certain, according to a cablegram of January 29, that the Egyptian cotton crop will exceed the first estimates by about 30 per cent.

Bad reports of the Winter wheat come from Iowa and from Southern Indiana and Illinois, where the land is said to be "a mass of ice." The early advent of cold, however, prevented much injury to the crop from insects everywhere, besides lessening the egg deposits of the pests, while the severity of the Winter has been fatal to many of them, so that, on the whole, although it is about time we should have a break in the run of fine crops, there is as yet no great fear that it will occur this r.

For the delicate and complicated difficulties peculiar to the female constitution, LYDIA E. PINKHAM'S VEGETABLE COMPOUND is the sovereign remedy. It aims at the cause, and produces lasting results. Send to Mrs. Lydia E. Pinkham, 233 Western Avenue, Lynn, Mass., for pamphlets.

TROPIC-FRUIT LAXATIVE is the best and most agreeable preparation in the world for constipation, biliousness, etc. One-half to one lozenge is the dose. Price 25 and 60c. per box.

The vigor of youth for the aged and infirm in Hop Bitters.

Burnett's Flavoring Extracts are used and endorsed by the best Hotels, Confectioners, and Grocers throughout the country. They are perfectly pure, and of great strength—at once the cheapest and best; and received the highest award at the Centennial Exhibition.

The Markets.

SPECIAL FROM THE CHIEF CENTRES.

Until Saturday, Jan. 29.

Boston.—Jan. 29.—WOOL—The transactions of the week were 1,550,000 lb of all grades and qualities, and still a very unsatisfactory market has to be reported. Manufacturers are carrying small stocks, and why they should hold back is not clear, as Wool can now be bought on as easy terms as it is likely to be purchased for some months at least. Fine Ohio and Pennsylvania Fleeces are a shade lower, and Michigan and Wisconsin X have also been sold at some concession, but the bulk of the stock is still held at the current rates for some weeks past, and there is no disposition on the part of holders to force the market. Foreign advices report no material change in the markets abroad, and Wool in the interior is held for higher prices than the article is now selling on the seaboard. The sales of Ohio and Pennsylvania X and XX have been at 46@48c; No. 1 Ohio at 50@51c; and Wisconsin and Michigan Fleeces at 42½@44c for X, mostly at 43c, and medium Michigan at 47@47½c. Some lots of XX Ohio can be bought at 46c., but most of the stock is held at 48c and upward. Combing and Delaine Fleeces have been selling at 44@46c for coarse; 50c for fine Delaine, and 50@54c for good and choice Combings. The sales of Unwashed Fleeces have been some 300,000 lb, and prices range from 15@20c for coarse and 25@38c for fine and medium grades. The demand for California Wool has been confined mostly to Fall grades, at from 18@27c, but the sales have been light, comprising only 200,000 lb. Pulled Wools continue in demand, with sales of 259,000 lb for the week at from 35@52½c for common and choice Supers; 80,000 lb of Eastern, Maine, and New York selling at 50@52½c. In foreign Wool there has been a fair business doing, with sales of Australian at 43½@47c, and Magdalene, English Combing, Cape, and other kinds at prices indicating no material change.

Chicago.—WHEAT active, firm; No. 2 Red Winter, 98@99c; No. 2 Chicago Spring, $1, cash; $1.00¾, February; $1 01⅜, March; $1 05⅛ May; No. 3 do. 84@87½c; Rejected, 69@73c. CORN fairly active at 37½c cash. OATS fairly active at 30¼c, cash. RYE firm at 88½@90c. BARLEY firm at $1 03@$1 04. FLAXSEED, $1 20. PORK active, firm, and higher at $14 10@$14 12½ cash and February, $14 27½@$14 30, March; $14 47½@$14 50, April. LARD active, firm and higher at $9.45, cash; $9 42½@$9 45, February; $9 52½@$9 55, March; $9 62½@$9 65, April. Bulkmeats strong and higher; Shoulders, $4 65; Short Rib, $7 40; Short Clear, $7.50. BUTTER—Creamery, 30@34c; dairy, choice, 23@25c; dairy, fair to good, 18@21c; ladle-packed, 15@17c; packing stock, 12@14c; roll butter, 18@18c; grease, 7@9c. CHEESE—Full cream, 12½@13½c; part skim, choice, 10@10½c; part skim, fair to good, 9@9½c; part skim, hard, 8@8½c; low grades, 4@6c. HAY—Prime qualities are in fair demand, while the poorer classes are dull and lifeless. We quote: No. 1 Timothy, ₹ ton on track, $15@$15 75; No 2 Timothy, ₹ ton, $13@13 50; mixed, $12@12 50; upland prairie, $11 50@12 50; No. 1 prairie, $8@9. SEEDS, were firm for most descriptions. Timothy was in small supply, good to prime selling at $2 47@3 50; fancy commanding $2 62½, and poor to fair ranging at $2 30@2 45. Clover was inactive at $4 75@5 for prime, and $5 20@5 30 for choice. Flaxseed was firm at former rates, $1 19 being reported as bid on track. Sales were reported of 3 cars and 722 bags at $2 30@2 45 for poor to fair; $2 47@2 50 for good to prime, and $2 62½ for fancy; 44 bags of clover seed at $5 for screenings; $5 25@5 30 for choice. Hogs—Market more or less excited, and higher; shipping in good demand, quality fair, mixed packing, $5 15@5 50; light, $5 30@4 50, mainly at $5 35@5 45; choice heavy, $5 50@5 95, all sold. CATTLE, in fair demand, slow but steady; common to fair, $3 70@4 50; good to choice, $4 70@5 20; exports $5.40; butchers' fairly active and steady at $2 25@4, the bulk at $2 50@3 25; light and common stockers quiet and weak at $2 50@3; good Steers and heavy feeders, $3 50@4. SHEEP, fair demand, but dull; common to medium, $4 10@4 50; good to choice, $5@5 50.

St. Louis.—WHEAT higher; No. 2 red Fall $1.02¾@1.02⅞ cash; $1.03¼@1.03⅜ February; $1 05⅝@1.06½ March; $1.07⅝ bid April; $1.09@1.09½ May; No. 3 red Fall 94½c; No. 4 88½c. CORN higher; 41⅜@41¾c. cash; 41⅜@41½ January; 39¼@39½c. February; 39½@39⅝c. March; 39⅝@40c. April; 40¾@41⅛c. May. OATS dull; 33c. cash and bid February; 33½c. bid March. RYE easy at 86¼c. BARLEY steady and unchanged. PORK higher at $14 cash; $15 March; $14.25@14 30 April. Lard higher at $9 30. Bulk meats firm; shoulders 4½c.; clear rib $7.10; clear sides $7 30. Bacon held higher; no sales. BUTTER—Creamery 30@33c.; choice dairy-packed 23@25c.; medium to prime do. 14@18c.; common do. 11@13c; roll, choice Northern, 18@20c; near-by make 12@13c to 14@16c—small lots choice 17@18c. CHEESE—Choice firm and in demand; poor dull; full cream 12½@15c; part skims 10@11c; poor skims 4@6c. SHEEP steady at $3.75@5.25.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Jan. 29, 1880.

BEANS AND PEAS.—The local demand for beans is fair, but there is not enough export call to strengthen prices or enliven the market for standards. The low price of Red Kidneys has attracted some export buying. Peas unchanged. Green in bbls. $1.60@1 65. Southern B. E. $2 per 2-bush. bag.

Marrow beans prime $1.77½@1.80, do, other $1.60@1.72, medium prime $1.70, do other $1.50@1.65, pea $1.60@1.75, white kidney $1.80@2.00, red do. prime $1.50@1.60, do. other $1.25@1.45, black or turtle soup $1.50, Lima $4.50@5.

BUTTER.—Supplies are not plenty, and with the run of trade generally directed to prime table grades. Sellers have a somewhat stronger position. No one quotes a positive advance, as the indefinite amount of the country surplus tends to make most sellers prefer to let well enough alone. If present prices for creamery, Western and State, and other State and Western styles are supported, expectations for the date will be in many cases exceeded. Exporters are a good support for useful second-priced grades, especially for Western goods; even rolls have gained some attention for foreign use.

Creamery, fine Western, 34c good to prime, 31@33c; fair to good 28@31c State ranges, 25@30; State dairies, entire choice, 25@26c; fair to prime 22@25c.; firkins, 20@25c.; State rolls and half tubs, full, 28@29c, fair to prime, 23@27c.; poor to fair 20@23c.; Welsh tubs, choice 26@27c; other 19@24c Western imitation creamery 22@28c.; dairy, fresh, 25@26c; other 21@24c.; factory fine, 24c.; other 15@18c., low quality, 13@14c.; rolls, choice 18@19c, fair to good, 16@17c.

Receipts for the week 21,075 pkgs.
Exports for the week, 10,058 pkgs.

CHEESE.—Export demand is less active and the feeling rather less firm, but no market change. Exports for the week 40,534 boxes. Quotations are for State factory, fancy, at 13¾c., do good and prime, 12¾@13¼c.; do fair to good, at 11¾@12¾c.; do, half skimmed, 10½@11¾c.; Wisconsin factory, fine, at 13¾@13½c.; do. good to prime, 12¾@13c.; do, fair to good, 11¾@12¾c.; Ohio factory, fine, 13@13¾c.; do, good to prime, 12@12¾c.; do, flat, fair to good, 11@12c; do, poor to fair 8@11c.

Receipts for week, 47,750 boxes.
Exports for week, 41,585 boxes.
Liverpool cable, 68s.
Steam to Gt. Britain, 30s.@35s.

COTTON—There has been a slow market this week without violent fluctuations in prices, closing at, for January at 11.59@11.63c.; February at 11.53@11.55c.; March at 11.75@11.78c.; April at 11.92@11.93c.; May at 12.07c.; June at 12.18@12.19c.; July at 12.28@12.30c.; August at 12.34@12.36c.; September at 11.83@11.85c.

Quotations for spot cotton are based on American standard of classification, and for cotton in store running in quality not more than half a grade above or below the grade quoted.

Receipts for the week, 27,874 bales. Exports do. 6,540 do.

DRIED FRUITS.—Apples have a very fair inquiry and prices steady. Peaches are in moderate demand. Small fruits are quiet.

Evaporated apples at 8½@8¾c. for the better qualities (some lots held higher) sliced apples at 5@6¼c. for good to choice North Carolina; 3¾@4¼c. for Va, apples, 4@4½c. for Tenn. do; 4¾@5¼c for State do; 4¾@5¾c. for western Ohio and Mich. Peaches at 30@32c. for evaporated peeled; 16c. for unpeeled do.; N. C. peeled at 20@21c. for the better qualities, unpeeled peaches at 6¾@7¼c. for halves and 6½@7c. for quarters. Plums at 15@16c. Blackberries at 8c. Cherries at 17¼c. Raspberries at 24@25c. Whortleberries at 12½@13c.

Receipts of all kinds for week, 1,760 pkgs.
Exports, including evaporated, 5,755 pkgs.

EGGS.—Receipts for the week 1,206 bbls.; do. last week, 1,019 bbls. At one time during the week extras brought 54@55c. Prices are still extremely high, but there is not supply enough here to make a market. The demand is only from buyers who cannot get along without some stock. If there are any eggs obtainable, holders are making the most of the present range by sending in very small lots. Limed have proved a bonanza for last owner this season.

Near Points, ₹ doz., 50c; all other fresh 47@48c; some fall laid quoted 43@50c.; the remnant of limed quoted 42@44c.

FLOUR.—There has been a very fair export demand the past week and a better home trade, with prices stronger.

Quotations are: $3.15@3.90 for very inferior to very choice superfine State and Western; $4.20@4 60 for poor to choice extra State and Western, odd lots and lines; $4.60@4 75 for choice to fancy do.; inferior to good white wheat, trade and family extras, $4 35@5.25; good to choice do at $5.30@6.00; (very choice up to $6 25 and fancy at $6.50@6 75;) red and amber winter wheat inferior to choice trade and family at $4.30@6; round hoop Ohio, $4.35@4 75; inferior to choice trade and family brands of spring wheat extras, $4.80@6.25, the latter for fancy; St. Louis $4.50@5.35 for inferior to good extra; $5.35@6 25 for good to choice (fancy brands quoted up to $6.50@6.75). Minn. clear, inferior to very choice at $4 25@6.; Minnesota "straight," poor to very choice, at $5 25@6.75, and patent inferior to fancy at $5.75@6.25; city mill extra at $5.25@5.45, for fair to choice for the West Indies; do. for England at $4.20@4.60 for poor to choice spring wheat; do. trade and family extras, $5.65@6.75; do, for South America $5.70@6.65, the latter for very choice; No 1 at $2 90@3.30 for very inferior to fancy.

Receipts for week, flour, bbls. 104,175; corn meal, do. 1,350; wheat, bush. 376,650; corn, do. 216,642; oats do. 186,100; rye, do. 31,810; malt, do. 59,244 barley, do. 41,510. beans, do. 4,776 rice, pkgs. 2,660

Exports for week, flour, bbls. 101,760 corn meal, do. 3,250, wheat, bush 760,441; corn, do. 219,167; oats, do, 2,000 peas, do. 7,300; beans, pkgs. 474; rice do 1,050.

CORN MEAL.—Sales at $3.25 for Brandywine, and $2.65@3 25 for yellow Western.

FRESH FRUITS.—Exports of apples for week, 8,700 bbls. Apples are dull and the market is easier. Greenings are not keeping well. The export run is upon prime stored Baldwins. Spitz. scarce. Late arrivals of mixed lots on wharf, $1@1.62, many of poor, frost-touched quality.

Baldwins $1.62@1.75; Greenings, $1.50@1.62; Spitzenbergs, $1.75@2. Holders of cranberries are a little nervous over the light trade to date and prices may fall off if trade does not revive. Cape Cod fancy bbls. $8; other, $4@7 N. J. crates, $1 75@2.25. Florida oranges of low grade are plenty; selected bring good prices. say $4 50@5 ₹ half-bbl. case after repacking; lots as they run, best $3@3.50; other, $2@2 75. Peanuts very quiet; cold weather restricts retail use, and that is an important feature in New York's trade; Va. hand-picked 4¾@4¾c.; other 3½@4¼c, shelled 3½@4¼c. Hickory nuts down to $1.00 ₹ bush. of 50 lbs. Black walnuts 40@50c. Pecans mostly out of first hands; a few lots have lately arrived, but we learn of no new quotations. Some fine hot-house strawberries are quoted in the fancy stores at $5@6 per quart. Black Hamburg grapes at $4 ₹ lb.

FURS AND SKINS.—Beaver has advanced here under London advices. At the late sale in London beaver advanced 20 per cent. large, 10 per cent. small. Market declined 10@15 per cent.

GRAIN.—Wheat has a stronger export demand and a fair speculative trading, and prices are higher. Exports for the week 765,000 bush.; latest prices are for

No. 1 white at $1.16¼@1.17 do. January at $1.16¼@1.16⅝ do. February at 1.16½@1.16⅝, do. March at $1.17¾@1.17⅞; do. May at $1.18¾@1.18⅝; No. 2 white at $1.15½@1.15¾; ungraded white at $1.14@1.16; mixed winter at $1.17@1.17⅞. No. 1 red at $1.24⅝. No. 2 red at $1.18⅞@1.19⅜ do January option at $1.18¾@1.18⅞; do. February at $1.19@1.19⅜; do. March at $1.20⅜@1.21⅛, do, April at $1.21⅝@1.22; do May at $1.21@1.21½; No. 3 red at $1.17, ungraded red at $1 05@1.21.

Rye at 97@$1.01.

Corn is in freer demand and firm; latest prices are for

New York No. 2 at 55¼@55⅝c do. January at 55⅛, do. February at 55⅜@55⅝, do. March at 55¾@56, do. May at 51@51¼, ungraded mixed Western at 53½@55⅝ New York steamer mixed at 54¼@55, New York No. 3 at 54¼@54¾, No. 2 white at 57@57¼ steamer white 51⅜@55⅛ New York yellow at 57; steamer yellow at 55½; yellow southern at 55½c.

Oats are in fair demand and firm; latest sales are of No. 1 white 48; New York No. 2 white at 45½@46¾; No. 3 white at 43¼; New York No. 2 at 43¼@43⅜, do February at 43⅝@43¾, do. March at 44⅝@44⅝, do. April at 44¼@44⅜; No. 3 at 43, ungraded white Western at 43@48, ungraded mixed Western at 42@43, white State at 46¾, No. 2 Chicago at 43¾.

HAY AND STRAW.—Demand is liberal and prices strong. Latest prices are for

Hay, prime timothy at $1.20 ₹ 100 lbs.; medium timothy at $1.10@1.15 do.; shipping grades at $1@1.05 do.; clover mixed at $1.05@1.10, clover at 95c@$1. do. Straw—No. 1 rye at $1.20 ₹ 100 lbs.; No. 2 rye at 75@80c, do.; oats and wheat at 70@75c. do.

HONEY.—The season is regarded as an unprecedentedly dull one. It looks as if many parcels of comb will be carried over.

White clover, comb, single, 16@17c.; larger pkgs. do. 14@15c.; buckwheat 11@12c.; extracted 6@10c.

HOPS.—Export demand slack here and home trade moderate, with prices unchanged. Quotations are for

	Cents per lb.

Olds, all growths	4 @12
Bavarians	30 @35
Pacific coast, new	20 @24

Receipts for the week, 4,322 bales.
Exports for the week, 1,208 bales.

LEATHER.—Quotations are for hemlock sole, 22@23c. for light: 23@24½c. for middle; 23@24½c. for heavy.

MILK.—Supplies have exceeded the Winter demand. The closing average price for commission cans, $1 89½ ₹ can of 40 quarts. Lowest and highest price, $1.80@2.

OIL-CAKE.—Western is quoted at $29 per ton.

PROVISIONS.—Hog products have an active demand and prices advancing.

Mess pork quoted at $14; new at $15; prime mess at $14, and extra prime at $15. Bacon at 7.70 for long clear and 8 10 for short clear. Beef at $21@22 city extra India mess. Beef hams at $19.50@20.50. Lard—Western steam at 9.85@9.87½ for spot lots, 9.85 for Jan. and Feb., 9.92½ for March, 10 for April, and 10.05 for May. Stearine at 10. Tallow at 6¾ for prime.

Receipts for week, beef, bbls. and tcs., 733; pork, 4,900 bbls.; cut meats, 38,742 pkgs.; lard, 26,525 pkgs.

Exports for week, beef, bbls. and tcs., 2,452; pork, 5,175 bbls.; cutmeats, 20,340,977 lbs.; lard, 5,612,617 lbs.

POULTRY AND GAME.—With moderate supplies of dressed poultry the movement is quite steady, fancy near-points not selling much quicker than good, bright other lots. Squab higher.

Turkeys, N. J. small, 13½@14c; other, 12@13c.; State, small, 12½@13c.; other, 11@12c.; Western, small, 12@12½c.; other, 11@11½c.; poor to fair, 9@10½c.; Philadelphia dressed, 14@14½c.; chickens, choice, 14@15c.; good to prime, including scalded, 11@12½c.; poor 9@10c.; chickens and fowls, W. 9@11c.; capons, 20@21c; small and slips, 15@18c.; fowls, good to prime, 10@11½c.; do. poor, 8@9c.; ducks, choice, 15@17c.; other, 11@13c.; geese, choice, 12c.; other, 8@11c., squabs white, $4@4.50, do. dark $2@2.50.

Fowls and turkeys are firm with the limited offering of dressed. Few geese reach the extreme.

Fowls, 10@11c.; chickens 8@9c.; roosters, 5@6c.; turkeys, 10@12c; ducks, best, 70@80c, other 55@65c. Geese, extra, $1.87@2; other $1.25@1.50. Pigeons, 20@25c.

With quail, grouse, rabbits and hares going out after Jan. 31 the market has been unsettled during the week in the anxiety to close out. The game season has not been a money making one.

Canvas-back ducks $1.50, red-heads 75c., mallard and black 50c.; teal 30@40c., common do. 25c.; quail prime trapped ₹ doz $2; do. poor $1.62@1.75; partridges 70c.@80c.; Grouse prime $1, do. drawn 80@90c. Hares, 30@35c. Rabbits 50c.

SEEDS.—Clover is quiet at 7½@8¼c.; Timothy is dull and nominal.

TOBACCO.—The feature of the market this week has been the large export demand, the Regie buyers taking some 10,000 hhds. at prices showing steadiness. Seed leaf is active and strong.

VEGETABLES.—Exports potatoes for week, 1,028 bbls. A steady demand and only light additions to supplies of potatoes cause a firm market for all stock in order.

E. Rose Eastern d.-h. $2.12@2.25, do, State, $2@2.12; do. in bulk $1.87@2 00. Prolific do. $1.75@1.87; Mercer do. $1.75@1.87; Chili Red $1.75; Burbank State d. h. $2@2.13 Burbank bulk $1.75@2, peerlessblow d.-h. $2.25@2.50; snowflake do. $2@2.12; do. bulk $1.87@2; peerless d.-h. $2.00; do bulk $1.75@1.87; Del. sweet $2 50@2.75; onions tending lower. Russia turnips, ₹ bbl. 50@75c.; white turnips 50@75c.; beets, 75c@$1; Hubbard squash $1; marrow do, 50c; onions, white ₹ bbl. $5@5.50 yellow do. $3.25@; red $3.25, Chester, $3@3.25; carrots, $1.25@1.37; cabbages, ₹ 100, $4@6; red, do. $6@8; celery ₹ doz. $1.25@1.50; West Indian tomatoes 50c@$1.25 ₹ box. Hot-house product—Tomatoes ₹ lb, 50@60c; cucumbers, choice, ₹ doz $3 do. culls 75c@$1; lettuce, Boston, ₹ doz 75c@$1; do. N. J. 4@50c; do. culls, 12@25c; radishes, ₹ 100, $1@5; rhubarb ₹ 100; $6@10.

WOOL.—There has been a very light trade this week, and prices rather easy. Quotations are for

XXX and Picklock Ohio, Penn., and Va. domestic fleeces quoted at 48@50c, XX 46@48c., X at 43@45c.; No. 1 at 43@46c, No. 2 at 46@46c.; common at 40@41c.; combing at 50@52c.

LIVE STOCK MARKETS

NEW YORK, Saturday, Jan. 29, 1880.

BEEVES.—Receipts for the week 12,132 head; do. last week, 11,322 do. Trade has been steady enough all the week to make a good average. The run of cattle was unusually good and prices again show a close range. The poorest sold at 8¾c. to dress 56 lbs.; medium to good, 9¾@10½c., to dress 56 lbs.; prime and above, 10¾@11½c, to dress 56@57 lbs.

COWS AND CALVES.—Sales are slow at 35@60c. ₹ head. Dealers do not look for a revival of trade until Spring.

VEAL CALVES.—Scant supplies of live and dressed have run up prices. Extra live sold temporarily at 9c.

Live fed choice 8½c, poor to prime 6½@8 Mt. Holly 5¾@8¼, buttermilk, 3½@4, grassers, 2¾@3 hog-dressed, prime, 11½@12, fair to good 10@10¾c.; common 5@7½c.

SHEEP AND LAMBS.—Receipts for week, 26,783 head; do. last week, 24,762 do. Market steady with moderate supply and a good demand for dressed at the various markets. Sheep ranged 5¾@6¾c.; lambs, 6½@7¾c.

SWINE.—Receipts for the week, 31,647 head; do. last week, 26,186 do. Supplies are large but seem to be wanted. The last turn of prices at the yards was rather high for city cutters. Live closed strong at $5 70@5.95 per 100 lbs.; for some lots $6 was asked.

Country dressed pork light 7¾c.; medium 7¾@7¾c.; heavy, 6¾@7c. city dressed State 6¾@7½c., city dressed Western 7¾@7¾. Pork tenderloins 11¾.

Reading for the Young.

FIVE HUNDRED CATS.

"O mamma come to the window, quick!
Come to the window and see;
Five hundred cats are in our yard,"
Said little Willie Lee.

"O no! my son," the mother said,
"I'm sure you can't be right;
Five hundred cats! why, that would be
A most terrific sight."

"But ma,' the yard is *full* of cats,
Three hundred I should think,"
"My son, where could so many, find
Enough to eat and drink?"

"Well, *fifty* then!" "Count them my child,
And see if ten you'll find?"
"Well, anyway mamma, there *is*
Another cat and *mine*."

FARMING FOR BOYS AND GIRLS—NO. 12.

HENRY STEWART.

Manure.

It is to the manure made on the farm that the farmer looks for the means of keeping his land fertile and productive. Manure is the refuse of the crops after the farm stock has been fed. When a horse has eaten a ton of hay and 50 bushels of oats part of this food has been spent in keeping the animal alive; part has been spent in giving him strength to work, and the rest is in the manure, so that if all the crops grown on a farm should be fed on it, and the manure of the animals returned to the soil, there would be very little lost, and the soil would recover the larger part of what had been taken from it in the crops. This must be evident because we know that all that has been taken from the soil is in the crops, and whatever part of these is not used up in making flesh or fat, milk or butter, will return to the soil those substances of which it was made up and which were taken from the soil. But an animal uses up a very small portion of those parts of its food which were taken from the soil to sustain its life. A horse will consume about 22 pounds of hay and oats in a day; of this only one pound and a half is mineral matter taken from the soil, 4½ ounces only are nitrogen which comes from the soil, and the remainder, 20¼ pounds, is derived from the air. But a large portion of this matter is returned in the manure; for instance, of the pound and a half of the mineral matter consumed, the whole will be returned by a full-grown animal that is not gaining in flesh—that is, lean flesh and not fat; of the 4½ ounces of nitrogen, 3¾ are returned, and of the remaining 20¼ pounds, 7½ pounds will be returned. The horse, therefore, uses up to support life only that part of the food which was taken from the air, leaving all the mineral matter and nearly all the nitrogen to be returned to the soil in the manure. It is nearly the same with a cow, but she uses up a little more of the mineral matter, which goes into the milk, so that when the crops on a farm are fed to horses, cows or sheep, and the manure is saved and returned to the land, the land loses so little that it would not be felt in a great many years.

But the farmer must sell something to procure money to purchase clothes and meet other expenses. If he is a dairyman and sells milk or butter only, the farm will become better year by year, because nearly everything that is taken from the land is returned to it, and the constant working of the soil and the effect of the manure upon it, tend to free a larger quantity of the fertile elements of the soil than are needed to supply the growth of the crops. If he is a grain grower and sells wheat and corn, he must make good the loss of these grains by buying some cheaper food and feeding this to his stock to make his supply of manure good, or he must procure some artificial fertilizer for the same purpose. If the farmer sells hay and grain and animals which are supported on pasture, and wastes or burns the straw, as has often been done in the West, the farm will soon become worn out and useless, and crops can no longer be grown. As manure is the support and food of the land, the farmer should exert every effort to procure all he possibly can; he should care for it in the best manner and should know how to make the best use of it.

Many farmers waste a large portion of the manure. It is left to lie in the yard, where it is soaked and washed by the rains, which carry off in dark streams the best part of it. Others, more careful, but equally wasteful, put it up into heaps in which it heats and dries until it loses its most valuable qualities, and becomes a light, dry, whitish substance that is almost without value. It is best kept in low, flat heaps, in which it may be moistened by the rain and yet not made so wet as to be damaged. One ton of the best kind of manure contains 1,500 pounds of water, and only 12½ pounds of potash, five pounds of phosphoric acid and ten pounds of nitrogen; 100 pounds of good artificial fertilizer therefore contains as much useful matter as 2,000 pounds of manure.

DAISY'S YEAR IN SOUTHERN CALIFORNIA.

ALICE P. ADAMS

Violet's Home.

Eight miles east of Los Angeles, the principal city of Southern California, lies the ancient mission of San Gabriel. Three-quarters of a mile to the northwest is a gradually sloping tract of land, which was, to all appearances, desolate and worthless until five years ago, when its enterprising owner constructed reservoirs for the purpose of irrigation, surveyed the land, divided it into five and ten-acre lots, and christened the whole the Alhambra Tract.

Intelligent people seeking rural homes heard of the Alhambra, only an hour's drive from the city, and located there. First among these came Mr. Erman; but perhaps you would prefer to hear Violet's impressions rather than to listen to a tiresome description.

"Yes, we were the first people on the tract. There was a little house on the place, and that was all except the live-oak trees. Everything about the house and on the ten acres has been done in three years and a half, and all the houses on the tract have been built in the same time."

"I don't see how it is possible for everything to grow so fast. Why, in a few years you could not see out at all if it were not for the avenue. Let us go out-doors; everything seems so strange, and I want to get acquainted as soon as I can."

"Are you sure that you are rested?" inquired Mrs. Erman. "For I am afraid Violet will forget that you are not strong, and will hurry you around as if you were to leave on the train to-morrow morning."

"I do not feel at all tired." "Oh, mamma, I'll be careful and only show her the flowers and things about the house," came from the lips of both girls as they went out on the veranda.

The house—one of the cottages which Californians seem to prefer for dwellings—had a broad veranda extending around three sides, and this was supplemented by a profusion of flowers and vines.

"What a lovely view you have!" exclaimed Daisy, as they stepped out on the veranda. "And those mountains! I would like to sit and watch them all day long."

"Yes," answered Violet; "when we first came it seemed as if we spent most of our time here on the veranda, talking about the view and watching the mountains. They seemed to change continually, yet were never twice alike. It was all so new to Bert and I, for you know Illinois is not noted for its mountain ranges."

"I should think not," laughed Daisy. "Now I want to see the flowers. These geraniums look rather different from those mother was putting in the bay window. What quantities of blossoms! Would you care if I picked a cluster?"

"I want you to understand, Miss Daisy," said Violet, solemnly, "that you are not to ask if you may pick the flowers. If you see a blossom that you want, break it off. That is the way people do in California."

"Vastly different from our habit a. home. Whenever we picked a cluster from the geraniums, mother always cautioned us to be careful not to pick one with buds on it."

"Ah, but your geraniums are not covered with blossoms twelve months in the year as ours are; neither do your roses grow to be such trees. Come down here on the grass and tell me if you ever saw a heliotrope like this."

"Why it is clear up to the veranda roof! Isn't that magnificent?" and Daisy buried her face in some of the fragrant clusters.

"Mamma grew it from a slip. Some of the plants and shrubs we bought; but the greater part of them came from cuttings. For a year or so after we came it seemed as if we couldn't go anywhere without bringing home the wagon full of cuttings and branches and roots that kind friends had given us; and then such a time as mamma had trimming, dividing and planting. But that is all through with, and mamma has plenty for all the new comers. Now I want you to pick a bouquet from what we would call house plants, in Illinois, and we will see how many flowers you can get on this first day of March. Begin with the heliotrope."

"I hate to pick it. It seems almost wicked."

"Well, I haven't any scruples"—and Violet began breaking off the fresh young sprays. "Then you must have a Marechal Niel rose. Here is a bud for beauty, and here is a bouquet in itself." As she spoke Violet reached up and picked a full blown rose whose dimensions were those of a saucer.

"Oh, oh!" cried Daisy in astonishment, "that's simply immense! I have seen Marechal Niel roses before, but they never looked like this."

"And I don't believe you ever saw seventy-five at one time, which I have counted on this very plant. Here are the carnations and geraniums. Help yourself to any amount of them, and you need not be particular about the buds."

Daisy was especially enraptured with the half dozen varieties of ivy geraniums which she had never before seen.

"Now I want you to see the abutilons. Here is one; see how many feet higher than the veranda roof it is. And there is the one with red blossoms just around the corner. But the prettiest of all is the trailing variety with spotted leaves."

"It is perfectly beautiful! How different the flower is from the other kind—almost like a fuchsia!"

"Here are the fuchsias on the north side of the house," said Violet. "But San Francisco is the place to see them in their beauty. It is too warm for them here in the Summer."

"I don't see how you can ask for anything finer than these. What are the little blue flowers?" asked Daisy.

"English violets; see how sweet they are, and then come over to the rose bed, or mamma will call us in before you have any roses; she is so afraid that you are tired."

Nearly all of the roses were pruned into tree form, and this was wonderful in Daisy's eyes, for the roses at home were bushes; and these sturdy brown trunks with their spreading heads were something of a revelation.

"There's a stalk bigger than my wrist! How long have these been growing?" asked Daisy.

"All of them have been grown from cuttings within three years. This large rose is the Safrano, and though it is one of the most common kinds, I think it one of the prettiest."

"Do these roses bloom all the time?"

"Nearly all the time. They do not blossom as full in very cold or very warm weather; and they must have some time for rest; but I don't believe there are half a dozen days in the year when we can not find roses of some variety."

While the girls chatted they went here and there gathering the prettiest buds until Daisy cried, "Oh, don't pick any more! My hand is so full I can't hold another flower. How I wish mother could see this! When I go home I'm afraid I shall turn up my nose at her precious house plants."

"Now, I want to show you——"

"Come, girls!" called Mrs. Erman from the dining-room door, "supper is almost ready."

"Oh dear!" sighed Violet, "I suppose we must go in, and you haven't seen anything but part of the flowers."

"Never mind; I don't want to see everything to-night. I have seen enough now to last me for a week."

"So Daisy has picked her first bouquet," observed Mr. Erman, as the girls entered the house. "I wonder if you can guess the name of this place?"

"I should think 'Rose Cottage' might be as appropriate as any," said Daisy, glancing at the wealth of roses she still held.

"Pretty well done!" Mr. Erman exclaimed, while the others smiled. "That is what my wife christened it three years ago when she commenced putting out cuttings. We all laughed at her then, for the place looked so forlorn and desolate, but I think she was about right after all."

LETTER FROM THE COUSINS.

Dear Uncle Mark:—Will you please enroll my name on your list as a Rural cousin? My mother is a subscriber, and is much pleased with your paper. I would like to tell the Rural cousins about my California home. We live now in the country but have been living in San Francisco. The woods here abound with game, such as deer, grouse, quail, hare, and now and then a bear or panther by way of variety. My mother writes for the papers, and has traveled considerably, and I have nearly always accompanied her. Did space permit, I would be pleased to tell the boy who "has never seen a railroad," of my adventures by land and sea. I have much fun hunting deer, though I do not kill a great many, as I am just learning to shoot. I set traps for quails, but catch more pigs than quails. I have a puppy I call Ranger, I am going to train him for a bear dog. My mother and I have begun our gardening; we have a nice lot of plants in a sunny, south window. We call our home "Sunny Side." Please Uncle Mark do not forget us in your free seed distribution. I am thirteen years old. California Boy.

Sunny Side, Cal.

The Puzzler.

CHARADE.

When in our town my first you see,
You need not pause to look;
Nothing it has to gladden thee,
Its gloom thou canst not brook.

But still by many poor 'tis sought,
To whom earth's love is cold;
By them small comforts can be bought,
They have no glittering gold.

My next the rougher sex admire,
If covering something neat;
Ungainly, 'twill not them inspire
Their glances to repeat.

Our lovely maids oft gently raise,
Oft gently put it down,
Abandoning quick such dainty ways
Should heaven's cloud o'er them frown.

Look! run! my whole comes on the scene,
All grace the fair deriding,
They in my last escape, I ween,
And to my first go hiding. R. J. D.

RURAL BRIEFLETS.

In the course of a well considered article in Scribner's Monthly for February, we find the following reference to the Rural Experiment Grounds:

"There are also several private experiment stations. Notable among these private stations is one owned and conducted by the Rural New-Yorker. This consists of a farm on Long Island and a garden and nursery in New Jersey, which are maintained solely for experiment; manures are tested, new seeds and plants are cultivated, new tools are tried, new methods of culture are examined, and, in short, new questions are asked of Nature. The results are for the exclusive use of the subscribers to the Rural New-Yorker, yet it is a real experiment station, and its work is of value to the general public. The subscribers ask questions concerning matters they have neither the time, skill, nor money to answer for themselves, and the paper puts the matter to practical test on its farm, and prints the result for the benefit of all. We have only to substitute the State for the newspaper, and the public for the subscribers, and we have a State agricultural experiment station." . . . .

Mr. Roe sends us a little box of his Highland Beauty (Jan. 20), a seedling of the Lady Apple, of great beauty. An illustration of it was given in the Rural New Yorker of April 19, '79—but the specimens sent are nearly twice as large. The skin is a golden yellow with crimson streaks and blotches. The flesh is tender—neither sweet nor sour—and agreeable. Mr. Roe, says: "I have no proper place to keep apples, and these have been kept in a room where they have been subject to alternations of heat and cold. Properly cared for, they may be had in good condition until May." . . . . . .

Mr. J. A. Foote, of Terre Haute, Ind., writes us:—"Your Corn Number is of great value, worthy the attention of any farmer in the land, and worth in itself the cost of a year's subscription. It puzzles me to account for the immense yield on your farm. Here on the finest corn soil a crop of over 75 bushels would be counted as extraordinary. The variety must have had something to do with it." It puzzles us, too. We have no doubt the variety had *something* to do with it. And yet the common eight and ten-rowed yellow flint yielded heavily, though raised without manure and planted too far apart for a kind that grows no taller. Let us see what light can be thrown upon it by another year's observations. . . . . .

We have received the following letter from John S. Harris & Son, of La Crescent, Minn.:

"We congratulate you on the success of the late Corn Number. Your new departure in devoting an occasional number to a special crop will accomplish much good. The great amount of information collected upon a certain crop at one time will attract attention and lead to better cultivation. Your distribution of seeds cannot help but be a lasting benefit to the country. The Beauty of Hebron Potato is the best early potato I have ever grown, and it is now better known and more extensively disseminated than it would have been in ten years had not the Rural brought it to notice in such a manner. I failed to receive my potato through the distribution but had so much faith in the Rural that I procured three pounds, planted four eyes; a hill, hoed them once, and dug 290 pounds, 4 5-6 bushels—all of good size and none hollow. Owing to the drought they did not yield quite as well last season as they might have done; but on the same soil and planted the same day they turned out one-fifth better than the Early Rose or Vermont, matured fully as early and sold for a better price. Hotels would use no others while the Hebron could be had. Our seeds received last Spring gave very satisfactory results, but were somewhat injured by drought. Is the Edible Pine hardy enough to endure Minnesota Winters? We are keeping ours in pots in the greenhouse."

We do not think it is known how cold a climate these pines will stand. Our own seedlings have stood 20° below zero without the slightest harm. If but for the sweet nuts alone (about the size of a hazel-nut) this pine is worthy of cultivation, and the Rural's distribution of it must in a few years test its hardiness and adaptability to the various climates of this country and Lower Canada. . .

We are very sorry to learn of the continued indisposition of Conrad Wilson. We have received the following announcement of the Business Farmer, of which he is editor:—"In consequence of a relapse that has unexpectedly overtaken its editor, his work is again interrupted by physical prostration brought on as before, by unremitting application. In his anxious desire and purpose to improve and extend the plan of his work, and in the further effort required to regain the time thus lost, he has entirely overtaxed his power of endurance. As this, of course, involves a still further interruption of the work in hand, it only remains for us to bow to the necessity that calls for a change of plan. Discouraging as such trials may well be to Mr. Wilson and his friends, it is yet gratifying to say that the most serious stage of his debility has passed, and that nothing more seems now required than an interval of rest. But for this untoward event, the first year's work of the "Business Farmer" would have been completed within the time. How soon the work will be resumed, and under what conditions, will shortly be more fully explained, and the whole matter will be arranged to the satisfaction of all parties. This point being assured, there is every reason to believe that the editor will soon be able to continue his investigations, though of course, under such conditions as will relieve the pressure of his labor." . . . . . .

PERSONAL ITEMS.

Fair, the new Nevada Senator, is assessed on $42,000,000 in Nevada alone.

General Joe Johnston has a good insurance business and considerable property.

Webb Hayes, who went to Washington thin and gawky, has become spruce and gallant. One old lady says that he is almost handsome.

Secretary John Sherman's handwriting puzzles even the printers. His face has lost its former look of care. He enjoys a good cigar.

M. Gambetta, who was re-elected President of the French Chamber of Deputies last week, received 262 votes, which was only three more than he received in 1880.

Mr. Budgett, a well-known merchant in Bristol, England, is colonizing a large property he possesses to the south of Lake Superior with emigrants from the neighborhood of Bristol.

M. de Lesseps counts on Italian laborers to dig the Panama Canal. They bored the Mounts Cenis and Gothard tunnels, and are considered the most steady, frugal, and intelligent in such undertakings.

The frontier telegraph office at Williams's Ranch, Brown County, Texas, is managed by Hallie Hutchinson, a little girl 9 years old. She handles her instrument with the precision of an old operator.

General Garfield is the first active Knight Templar who has ever been elected President, and encampments of the order in different parts of the country are talking of taking part in the inauguration ceremonies.

The friends of Congressman A. H. Stephens, of Georgia, do not expect that he will regularly attend the sessions, but that he will be present on important occasions to vote, or that, in case of extreme ill-health, he will pair with some Republican.

After all the assertions and contradictions anent the matter, it seems that the Baroness Boudett-Coutts is going to marry Ashmead Bartlett, some day this week. The marriage is to be strictly private, at her own residence—if it takes place at all.

The President is getting fat, and his neck is wrinkling redly over his collar. His beard is becoming that sort of gray which seems to be a commingling of orange and white. His hair is a kind of sherry-and-straw color now, and is as sleek as it can be brushed. His favorite gloves are black, as becometh a President.

[Milwaukee Sentinel.]

That wonderful remedy for rheumatism, St. Jacob's Oil, has been used by a large number of people in this city, and with effect truly marvelous. Frequent reports are made where sufferers have been afforded relief, and the sale is growing largely. The fact that it is an external remedy, commends it to many who would not otherwise think of going out of the beaten track to find a remedy.

GENESEE VALLEY FARMS FOR SALE.—Some of the finest residences in the Valley, near R. R. Inquire soon of JOHN SHELDON, Fort Collins, Colorado.

KIDNEY-WORT

PERMANENTLY CURES KIDNEY DISEASES, LIVER COMPLAINTS, Constipation and Piles.

Dr. R. H. Clark, South Hero, Vt., says, "In cases of Kidney Troubles it has acted like a charm. It has cured many very bad cases of Piles, and has never failed to act efficiently."

Nelson Fairchild, of St. Albans, Vt., says, "It is of priceless value. After sixteen years of great suffering from Piles and Costiveness it completely cured me."

C. S. Hogahon, of Berkshire, says, "One package has done wonders for me in completely curing a severe Liver and Kidney Complaint."

IT HAS WONDERFUL POWER. WHY?

Because it Acts on the LIVER, the BOWELS and the KIDNEYS at the same time.

Because it cleanses the system of the poisonous humors that develope in Kidney and Urinary diseases, Biliousness, Jaundice, Constipation, Piles, or in Rheumatism, Neuralgia and nervous disorders.

KIDNEY-WORT is a dry vegetable compound and can be sent by mail prepaid.

One package will make six qts of medicine.

TRY IT NOW!

☞Buy it at the Druggists. Price, $1.00.

MITCHELL, LEWIS & CO., Racine, Wis.

Humorous.

"Is that mule tame?" asked a farmer of an American dealer in domestic quadrupeds. "He's tame enough in front," answered the dealer.

We see an article in the papers about boy inventors. We hope they will invent a boy who won't whistle through his fingers and yell on the streets at night.—Cincinnati Saturday Night.

"Papa, they don't have any stone in Ireland; do they?" asked a little boy the other day. "Yes, my boy; but why do you ask such a question?" Because I thought it was all sham-rock over there."

It takes a country schoolmaster for shrewdness. When the weather is cold and the school house imperfectly heated he puts the head of the class nearest the stove, and then all the scholars work like blazes to rank high in their studies.

A gentleman once remarked to a witty lady of his acquaintance that he must have been born with a silver spoon in his mouth. She looked at him carefully, and, noting the size of his mouth, replied, "I don't doubt it; but it must have been a soup-ladle."

It is mighty embarrassing to a man who has some religious friends staying with him, to have his dog, which has been very quiet during week days, begin right after breakfast Sunday to run to the gun in the corner and turn to his master and wag his tail, and then run back to the gun again.

A lady with a fatal squint came once to a fashionable artist for her portrait. He looked at her, and she looked at him, and both were embarrassed. He spoke first. "Would your ladyship permit me," he said, "to take the profile? There is a certain shyness about your ladyship's eyes, which is as difficult in art as it is fascinating in nature.

Trouble Ahead.

When the appetite fails, and sleep grows restless and unrefreshing, there is trouble ahead. The digestive organs when healthy, crave food, the nervous system when vigorous and tranquil gives its possessor no uneasiness at night. A tonic, to be effective, should not be a mere appetizer, nor are the nerves to be strengthened and soothed by the unaided action of a sedative or a narcotic. What is required is a medicine which invigorates the stomach, and promotes assimilation of food by the system, by which means the nervous system, as well as other parts of the physical organism are strengthened. These are the effects of Hostetter's Stomach Bitters, a medicine whose reputation is founded firmly in public confidence, and which physicians commend for its tonic, anti-bilious and other properties. It is used with the best results in fever and ague, rheumatism, kidney and uterine weakness and other maladies.

SEEDS.

PURE SUGAR CANE SEED

The undersigned keeps a supply of Early Amber and Early Orange cane seed, the product of different latitudes; hence adapted to various climates. The Orange is especially recommended for sugar making and for districts subject to hot sun in July and August. It has received the indorsement of the Mississippi Valley Cane Growers' Association at its late meeting.

Prices of seed at St. Louis: Early Amber, by mail, 3 pounds, $1; by express or freight per pound, 15c.; large lots, 10c. Usual discounts to the trade.

Early Orange, by mail, 2½ pounds, $1; by express or freight, per pound 20c.; large lots, 15c.

Kansas Orange, for northern culture, prices same as Early Orange.

No orders filled for less than $1. Remit by draft money order or registered letter.

Caution must be taken in selecting Orange seed, as when cleaned, none but an expert can detect it from some other variety, and the desire to speculate may induce some to mislead by selling other seed as Orange. It was for this reason that I had placed this seed in reliable hands last season for cultivation, in order to secure reliably pure seed for my trade.

THE
RURAL NEW-YORKER
A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

Vol. XL. No. 7. Whole No. 1620. | NEW YORK, FEB. 12, 1881. | Price Five Cents, $2.00 Per Year.

[Entered according to Act of Congress, in the year 1881, by the Rural New-Yorker, in the office of the Librarian of Congress at Washington.]

OUR HARDY SHRUB & TREE SPECIAL.

They are suited to special wants and require special care. The descriptions are necessarily brief and imperfect, so that, unless the intending purchaser has already a knowledge of the plants desired, he is as likely as not to order those which, after several years of patient waiting, he finds are not at all suited to produce the effects which his imagination had painted. In many cases, such disappointments end in discouraging people from further endeavors, while a better selection might have proven the beginning of that love of beautifying the home grounds, which, more than many are aware of, has to do with a love of the home itself.

Let us think of two country homes in all respects alike, except that one is surrounded by shrubs and trees, and the other is not. Let us ask the disinterested passer-by—"In which would you rather live?" Think you his answer would be long delayed? It is the same with our children. A naked, treeless country home engages not the affections. Beauty invites approach, contact, association; while ugliness, like neglect, decay, danger, drives us away. And yet, as between the two country homes above alluded to, is the *cost* of planting and raising those trees and shrubs greater than the benefits to be derived from them? If this were so, there would be a valid, a forcible excuse for the naked, cheerless, wintry farm homes everywhere to be seen. To show that the judicious, economical planting of shrubs and trees about the farm house is one of the most profitable, beneficent, satisfactory investments the farmer can make is one of the purposes for which this special number of the Rural New-Yorker has been written and presented to its readers. We have made most of the following notes from our own careful experience through many years. For the most part they have been derived from experience here at the Rural Grounds, which, being in a valley running north and south, are exposed to unusual vicissitudes of climate. There is rarely a Winter passes during which the thermometer does not reach 10° below zero; while we rarely escape the latest frosts of Spring and the earliest of Fall.

THE BEST OF THE HARDY SHRUBS AND TREES OF EASY CULTIVATION.

HOW LITTLE IT WILL COST To Beautify the Grounds Abou the Country Home.

Easily Transplanted Trees and Shrubs that Grow in the Meadows and Woods About.

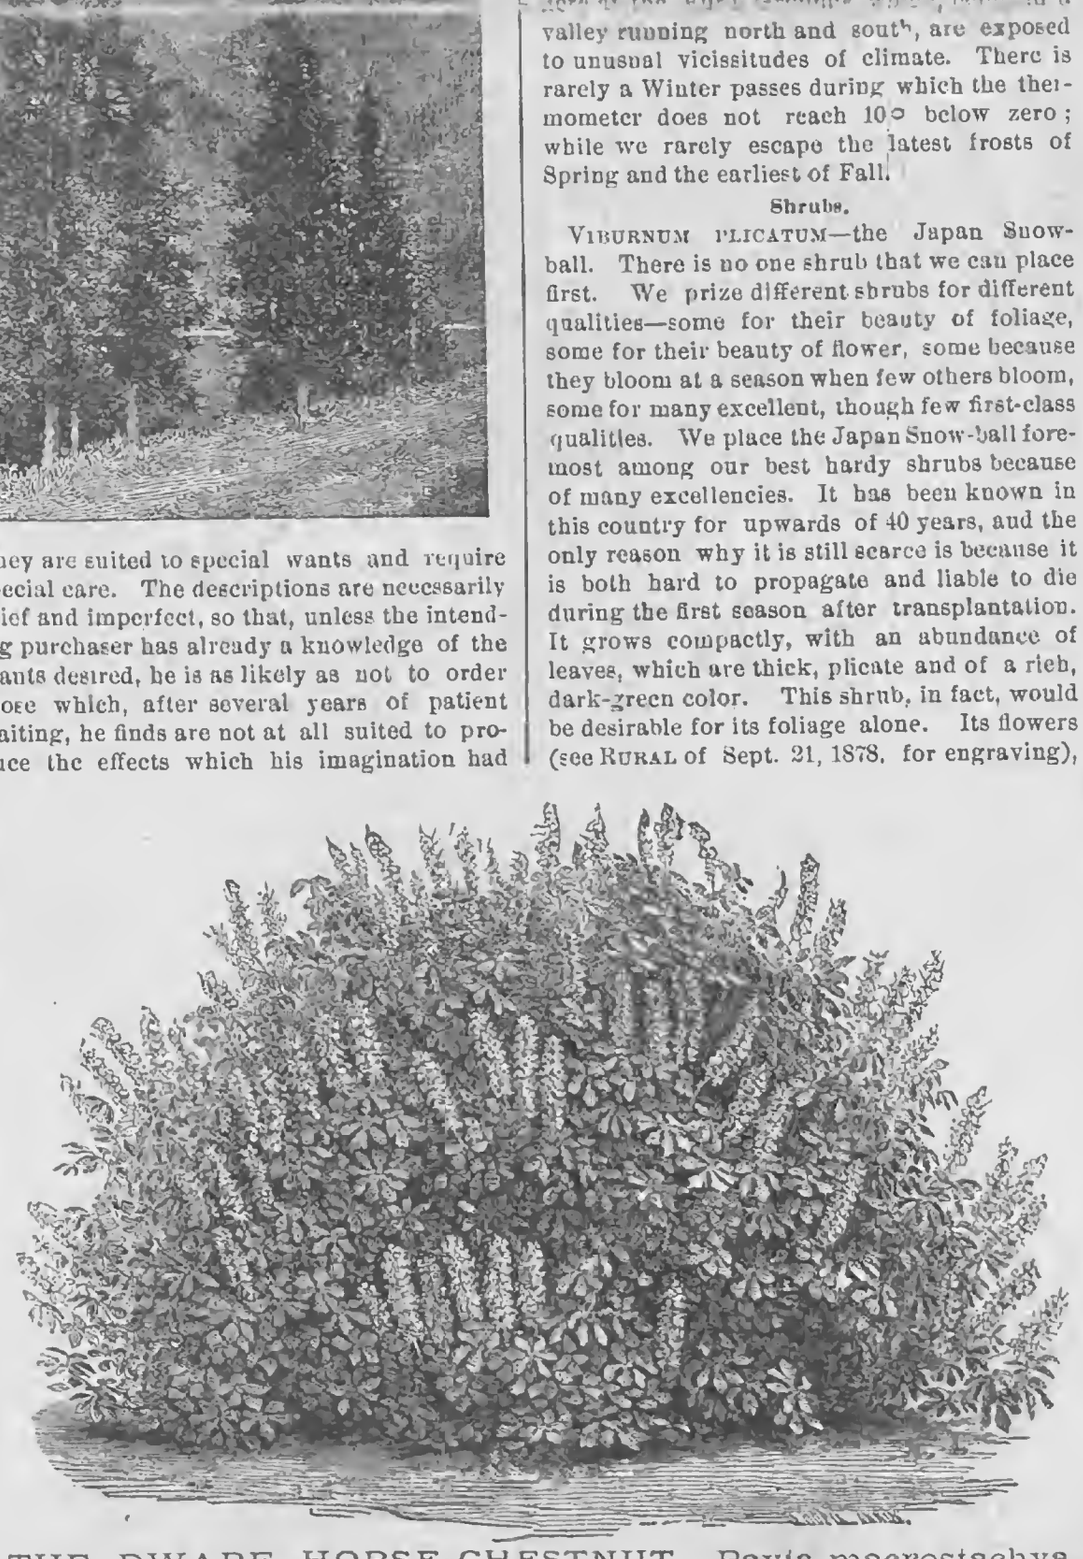
What Excuse is there for Treeless, Naked Door-Yards?

The Duty which Farmers owe to their Families to make their Homes Attractive.

NOTES FROM THE RURAL GROUNDS.

Select Hardy Shrubs and Trees for the Country and Suburban Home.

There is not a shrub or tree mentioned in this paper which may not be found in the nurserymen's catalogues which are noticed in the columns of the Rural New-Yorker from time to time. But such lists present hundreds of plants which, for one reason or another, are not well adapted to country homes in general.



THE DWARF HORSE-CHESTNUT.—Pavia macrostachya. Fig. 60.

Shrubs.

Viburnum plicatum—the Japan Snow-ball. There is no one shrub that we can place first. We prize different shrubs for different qualities—some for their beauty of foliage, some for their beauty of flower, some because they bloom at a season when few others bloom, some for many excellent, though few first-class qualities. We place the Japan Snow-ball foremost among our best hardy shrubs because of many excellencies. It has been known in this country for upwards of 40 years, and the only reason why it is still scarce is because it is both hard to propagate and liable to die during the first season after transplantation. It grows compactly, with an abundance of leaves, which are thick, plicate and of a rich, dark-green color. This shrub, in fact, would be desirable for its foliage alone. Its flowers (see Rural of Sept. 21, 1878, for engraving), or balls of flowers, are larger than those of the Guelder Rose (Viburnum Opulus) and more compact, of a white color slightly tinted with green, and they remain upon the bush for a month or more and finally drop while still in a well-preserved condition. It has proven here perfectly hardy. See fig. 75, p. 103.

Viburnum lantanoides is the American Wayfaring-tree, or Hobble-bush, found in cold, moist woods from New England to Pennsylvania and in the Alleghanies. It is not to be compared with the Japan Viburnum in any way, except that it bears fruit of a red color at first, turning darker as it decays. It is of rather straggling habit naturally, but this is partly overcome by seasonable pruning. The cymes of flowers are broad, flat and possessed of little beauty.

The Guelder Rose (V. Opulus) is also well known by the name of High Cranberry Bush in its wild state. In this the inner flowers bear an acid fruit which has been used as a substitute for cranberries—whence the name. It loses its fruitfulness under cultivation, all of the flowers becoming sterile.

Hydrangea paniculata grandiflora—the Great-panicled Hydrangea. This shrub has emphatic merits and emphatic faults; but it

Wier's Cut-leaved Silver Maple.—Fig. 61.

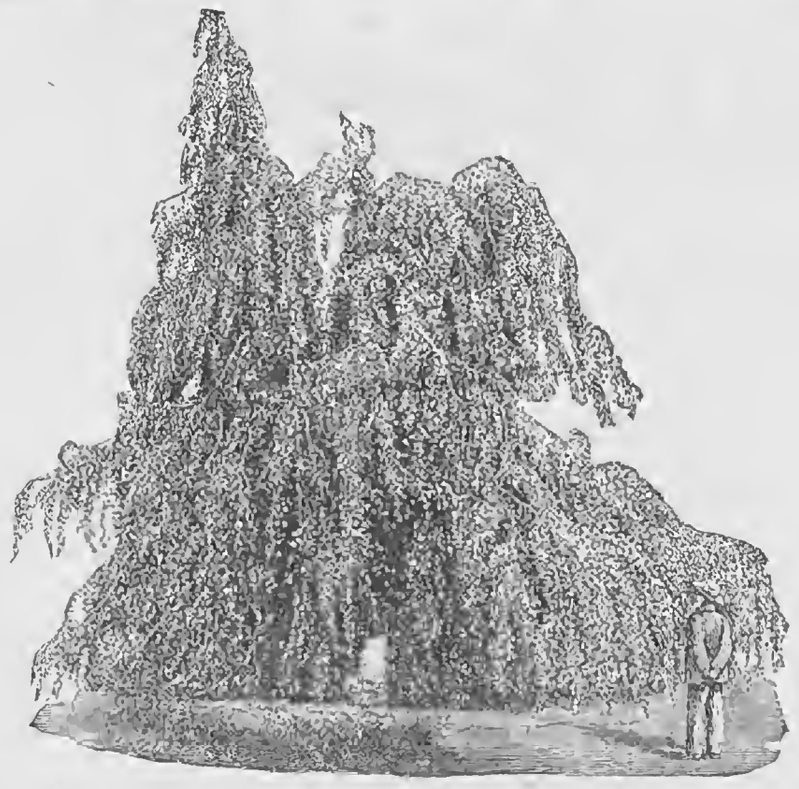
is, nevertheless, worthy a place in every garden. It is perfectly hardy. Indeed we do not know of a hardier shrub or one that will thrive with less care. It propagates freely from green wood, and the branches, which are borne to the ground by their weight of immense terminal panicles of flowers and there held in contact during a week or so, will often be found to have become well rooted plants. These may be separated from the rest of the stem at any time, planted in any convenient place, and they will bloom the next season. It may be mentioned that, though many shrubs fail to bloom the season they are transplanted, this hydrangea never fails, and the immense size of the flower heads often bears an almost ludicrous disproportion to the littleness of the plant itself. It is a fierce grower, and one has not to wait patiently for several years to see it in all its glory. A plant 18 inches high has borne with us 12 panicles—thyrses properly. The flowers begin to bloom in early August and continue until frost. When first unfolding they are of a greenish-white color—never purely white—which finally, when cold nights occur, changes to a faded-rose color. These flower head, or thyrses, sometimes measure two feet in circumference and 14 inches in convex length—we mean from the base to the apex of the cone. We once counted upon six plants 125 panicles. Their showiness may be we judged by such a display. There are two kinds of flowers which make up these masses of bloom. The showy ones are about one inch in diameter and the calyx is the only showy part. In the center of this is a little ball the

size of a pin's head, which consists of the true petals enveloping the stamens. The *perfect* flowers—those having both pistils and stamens—are borne beneath the others and are scarcely a quarter-inch in diameter. But we have never known them to bear seed.* This hydrangea is one of the *showiest* plants in existence. There is nothing choice about it in any particular—nothing that invites a daily call or inspection. The leaves are thin and coarse and droop under a hot sun. We admire it at a distance without ever caring to pluck the flowers or go near them. It fills a gap in Summer when flowers are sadly needed, and so we welcome the Great-panicled Hydrangea's showiness without caring ever to cultivate an intimate acquaintance.

THE CALIFORNIA PRIVET.—Of the half-dozen species of privet which are well worthy of cultivation, we have now to speak mainly of the "California" Privet—the best of all. Why this has been called the "California" Privet, we are unable to learn. The botanical name is Ligustrum lucidum or ovalifolium, and it is a native of Japan. It is thought by some to be merely a variety of Ligustrum Japonicum, but this species will not stand even an average Winter of this climate. The California Privet cannot be praised for its flowers; for, though white and as pretty as those of the lilac, they are not borne every season and rarely in abundance. Upon poor, sandy soil, we have known them to bloom profusely, but in such soil the plant itself loses in foliage and vigor more than is gained by the flowers. It may surprise our readers to learn that we esteem this common, cheap shrub, that is usually spoken of only in connection with hedges, in all other respects as scarcely inferior to any other. The smooth, broad leaves are thick and semi-evergreen, remaining fresh and unharmed until after Christmas. They grow closely together and opposite, so that the bush presents a full, clean, regular shape, while its switch-like stems are as straight and pliant as those of the Basket Willow. Occasionally a very severe Winter kills the wood of the preceding year; but the roots are never harmed and its growth is so rapid that it very soon attains a size larger than which it is scarcely desirable it should grow. We have this privet growing upon sandy hillocks, in clayey bottoms and along the banks of the lake not over a foot above its surface water; we have it growing under the eaves of the house within a foot of a brick foundation, and it thrives everywhere. It seems alike pleased whether the season is wet or dry, never having been appreciably harmed by excesses of either. It is propagated so freely that one could easily raise in one year hundreds of plants from cuttings of a single plant.

THE SHRUB, OR LONG-RACEMED, HORSE-CHESTNUT.—This is an excellent shrub for a farmer's front yard. It spreads out from the neck of the root, the branches hugging the ground for a foot or more, and then curving upward, forming a splendid hemispherical bush, greater in width than in hight. Thus our best specimen, now seven years old from the nursery, is about four feet high and not less than 15 feet in circumference. This specimen, last Summer, bore 55 racemes from six to 16 inches in length, bearing slender, whitish, fragrant flowers with stamens twice as long, crowned with pale-red anthers. It is a beautiful sight, blooming, as it does, in July when few shrubs are in bloom. For two or three years after transplanting, this shrub seems to remain stationary and is not an object of striking beauty. But if growing in a rich soil with plenty of room, it afterwards grows rapidly, sending up shoots thickly, the foliage of which quite covers the stems, forming a peculiarly beautiful shrub. Its botanical name is Pavia macrostachya, and it may be found on the lists of almost any nurseryman. It is a native of America, found mostly in South Carolina and Georgia, though showing in its wild state scarcely any of the many beauties which develop under cultivation. It is thoroughly hardy in this climate and, we believe, for a considerable distance north. We have already presented life-size engravings of the flowers and leaves. Our little cut is re-engraved from Mr. A. J. Downing's work on Landscape Gardening.

STUARTIA PENTAGYNA.—This very hardy, beautiful shrub belongs to the Camellia family, and has no familiar name that we know of. Stuartia (after John Stuart, Lord Bute) is itself an easy, agreeable name and may stand as well for the "common" as for the botanical name. It blooms in late July and early August, and thus adds another flower to the dearth of shrub-blooms of the Mid-summer. Its flowers average larger than those of Stuartia Virginica, (three inches across) of which an engraving is given; they are of an ivory-white color and borne in profusion upon mature plants. The Stuartia is no novelty, being a native of the Alleghanies of Virginia; but it is seldom seen in ornamental grounds, though it is one of the most desirable hardy shrubs that grow in this or any other country. It grows from six to twelve feet in hight; thrives in almost any soil, and we know of specimens 15 years old within a few miles of us, that have never been harmed in the least by Winter's cold or the sometimes more trying changes of early Spring. Nevertheless, we have heard that it is sometimes harmed at Rochester, though we should be glad to have the report strengthened by those who have tried it thoroughly. The Virginian Stuartia is less hardy, and is a smaller, more slender shrub.



WEEPING BEECH, (Fagus sylvatica pendula.)—FIG. 62.

THE WHITE FRINGE—Chionanthus Virginica. If but for the oddity and grace of its flowers we should find a place for one specimen of this large shrub, or little tree, among our selection. They are borne in loose, drooping panicles, and the linear petals, of a snowy whiteness, grow upon slender pedicels, so that the white, filamentous leaves seem to be floating in the air. The leaves are large and firm without a cleft or lobe. Our specimens have proven perfectly hardy here. It is found on river banks in Pennsylvania and southward.

THE JAPAN QUINCE — Cydonia Japonica. Among the showiest of garden shrubs, this well known plant must not be forgotten. It cannot be spared from any collection. The blossoms are almost unequaled by those of any other shrub for brilliancy, while the leaves are fresh, glossy, and green from early Spring till after frost. In selecting the Japan Quince, our readers should choose the different colors as described in nurserymen's catalogues. There are pure white flowers, scarlet, dark-crimson, orange-crimson, and one (Mallardii) with crimson center and white towards the edges of the petals. There is also a scarlet double-flowering variety. One of each kind, if planted in a clump, makes a brilliant contrast, while if planted here and there each is showy enough to command admiration for itself. For hedges as well as for the purpose of shutting out unsightly places, or for imparting an easily-maintained beauty to the less frequented parts of the grounds, this Japan Quince is almost unrivaled.

KALM'S ST. JOHN'S-WORT (Hypericum Kalmianum) is a fine, round little shrub, that is found wild about the northern lakes. The narrow, bright, leathery leaves are nearly evergreen and they will stand severe droughts without injury. It blooms early in July, the golden flowers, remarkable for their great number of stamens, standing out boldly and enduring for a long time the fierce sun of this hottest month of the year.

THE SPIRÆAS are too numerous to mention in detail. The Nine-bark (Spiræa or Neillia opulifolia), though less prized for its flowers than many others, is very pretty in fruit, which covers the bushes with inflated pods of a red color. The leaves resemble those of the currant. Young plants grow upright; but the branches become recurved in older ones which are often ten feet high. The Golden Nine-bark is very showy when the leaves first unfold; but the golden color soon fades away and there is nothing to distinguish it from the species.

SPIRÆA PRUNIFOLIA, fl. pl., a Japan species bearing double flowers, is one of the best. It suckers rather freely when young, but this is not objectionable later, for the reason that the plant assumes a balloon shape that one has no desire to attempt to improve. The flowers appear about May 30, and soon the bush is a mass of white, lasting until June. We estimated upon a specimen three feet high, that there were not less than ten thousand of these little white rosettes. As the buds break, we find an involuere, or whorl, of four or five small leaves. From these from two to five thread-like peduncles grow an inch in length each bearing a flower. These whorls of leaves are scarcely a half-inch apart, so that the bush is really a mass of flowers. The little flower itself is well worthy of a close examination.

LARGE-LEAVED MAGNOLIA, (Magnolia macrophylla.)—Fig. 63.

First we find an outer star-shaped calyx, or involucre; then an inner whorl forming a second star alternating with the first; then the whorls of roundish, white petals forming an oval, white flower like an agate button, half an inch in diameter. The whorl of leaves from which the flowers spring remains stemless until the flowers begin to disappear, when the nodes lengthen and the wood forms for the season. The leaves are beautifully glossy during the Summer, changing in Fall to a rich bronze. It is very hardy.

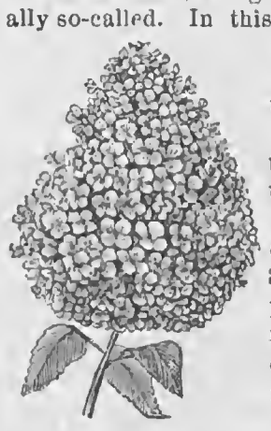
S. sorbifolia is always the first of the Meadow-Sweets to leaf out. In fact, it often takes advantage of mild periods during Winter to unfold its buds. It blooms in early July, bearing its little flowers in compound racemes a foot in length and of a soft, feathery, plush-like white. The habit of the plant is spreading and lawless. The leaves are from six to ten inches long, compound and unequally pinnate, with eight pairs of leaflets which are handsomely veined and doubly serrate. This spiræa is better suited to parts of the garden where less rampant growers might not thrive so well.

S. salicifolia, ulmifolia, Nobleana, Reevesii, callosa, Thunbergii are all good kinds.

Spiræa Aruncus, Goat's-Beard, is one of the hardy herbaceous spiræas, blooming early in June. The flowers are in spikes resembling catkins, and there are so many of these spikes as to form large and showy panicles of creamy-white.

Spiræa Fillpendula. The double variety of this is a great improvement. It is peculiar for its variously-cut leaves. Its root is tuberous; the flowers appear in early June, as with the foregoing and the following, and are of a pinkish white color.

THE ASTILBE, though not a spiræa, is generally so-called. In this the flowers are larger than in the preceding, blooming at the same time. It is valued for forcing in the greenhouse, though less at present than in years past.



HYDRANGEA—(paniculata grandiflora.)—FIG. 64.

HIBISCUS SYRIACUS, often called Rose of Sharon, is one of those plants that we deem as necessary to the flower garden as strawberries are to the small-fruit garden. The little cut, page 101, about one-quarter life size, shows the single-flowering kind which, to our fancy, is much prettier than the double. This Shrubby Hibiscus is one of the latest shrubs to unfold its buds in the Spring, for which tardiness it compensates by blooming late in Autumn. The flowers are white, rose, purple, violet, yellow and striped. This plant grows readily from seeds and the seedlings so vary as to render seedling cultivation extremely interesting. They may also readily be crossed. The Variegated Double-flowering Rose of Sharon must rank among the first variegated shrubs. The leaves are creamy-white and light-green. The only objection to it is the double flower which rarely opens. The half-open buds look as if they were blighted.

WEIGELAS (Diervilla, botanically) are profuse-flowering shrubs, but the flowers are somewhat dull in color, which, with the fact that their foliage is not particularly engaging, places them, if not in the list of second-rate shrubs, rather low in the first-class. The White-flowering Weigela (Diervilla hortensis nivea) bears pure white flowers which bloom more or less during the entire season, though not at any one time as profusely as the others. The catalogues alluded to in this number will furnish full lists from which those who desire may select. We would recommend simply Rosea and a variety of it known as Desboisi. Let us call the attention of our readers to the fact that this, too, may be raised very easily from seeds, though they are finer than those of portulaca. A few years ago we crossed Rosea with Nivea (the pure white.) We raised about 20 plants. All of the flowers were various shades of rose, while the foliage of several of the plants was distinctly variegated.

DEUTZIAS are also free bloomers, though their season is shorter than that of weigelas. We have the objection to deutzias that the foliage is dull and scanty, and that it suffers during very dry weather. The double-flowering kinds are best. This plant also is readily raised from seeds. We have raised many seedlings here, and can assure our readers that a fair percentage (not less than one-quarter) of double or partially double flowers may be looked for from seeds of double flowers.

EXOCHORDA GRANDIFLORA should have been mentioned under spiræas, since it is now classed under this genus. Its flowers are

* It may be interesting to those who examine little matters in their floral occupations to know more of the peculiarities of the flowers of this plant. The *perfect* flowers are borne upon *short* pedicels. Those of the imperfect or showy flowers are longer, and seem as if they were elongations of the fleshy pistils of the little perfect flowers. Some of the calyxes of the imperfect flowers have three and some four sepals. The little perfect flowers bear 10 anthers of a pink color, and five petals and five sepals. Five of the stamens are long—five short. The pistil is 3-fid, fleshy and short. The imperfect flowers bear but eight stamens. It is rather queer that these latter, when they have but three sepals, have three little bracts upon the pedicels, while those having four sepals—the usual number—have but *two* of these bracts. There are other coincidences between these imperfect and perfect flowers which cannot fail to interest those who study botany.

larger than those of other spiræas, white and borne in axillary, few-flowered racemes. It comes from China, is very hardy, grows to the hight of 10 feet in as many years, flowers in May when the shrub is nearly as white as a bank of snow. The bark exfoliates as in Nine-bark though not so freely.

THE JAPAN MAPLES. These must be classed as shrubs. We should be pleased on account of their beautifully cut and colored foliage to commend them as suited to those general purposes which alone we are at present considering; but their exceedingly slow growth and high price forbid.

CERCIS JAPONICA—the Japan Judas-tree. We have spoken of this shrub in another place, and reference is again made to it here because it should not be omitted in any collection of shrubs, however small. A fine engraving of the leaf, stem and fruit was published in this journal, December 18, of last year. In these grounds there is but one specimen, about six years old from the nursery. It is now but six feet high, having been injured occasionally by severe cold. It has never failed, however, to wreathe its lower branches in rich, rosy-purple flowers in May, nor to cover itself with a wealth of large, thick, glossy, deep-green, heart-shaped leaves. It is propagated with some difficulty, but grows readily from seeds which, however, are in this climate rarely produced.

FORSYTHIA VIRIDISSIMA. Among the sturdiest and worthiest of early blooming shrubs is this—the Golden Bell. Its long shoots remind one of willow shrubs—its flowers, of our Dog's-tooth Violet. It begins to bloom here usually about April 20th, before the leaf buds break. It is in full bloom usually about May 1st, when it resembles a bush of yellow stars. The flowers fade away about the middle of May, when the fine, serrated foliage is fully developed. This lasts until early Winter, changing to a deep purple.

HALESIA TETRAPTERA, or Silver Bell, is a symmetrical little tree or large shrub, which is found wild in parts of Ohio, Virginia, North Carolina and southward. The white bell flowers droop from slender pedicels in small racemes, but they last for two or three days only. The stems of this tree are clean and shapely, the wood very hard, the bark gray and dark-brown handsomely striated.

Hardy Shrubs with Variegated or Colored Leaves.

There are hundreds of them, and yet there are few we can place in our present selection. The variegated Cornelian Cherry (Cornus mascula variegata) is one of the best. The leaves are yellowish-white and green; the plant very hardy. It grows from five to eight feet in hight. The variegated double-flowering Hibiscus Syriacus already mentioned; the variegated-leaved Coral-berry (Symphoricarpus vulgaris); the Golden leaved Elder (Sambucus nigra aurea); the Silver-leaved Elder (Sambucus nigra argentea); the Purple-leaved Filbert) Corylus Avellana atropurpurea. This and the Golden Nine-bark look beautiful together in early Spring. The Purple-leaved Barberry.

Other Hardy Shrubs Worthy of a Place in Any General Collection.

Standard Honeysuckles should not be omitted in any general collection. They are desirable for their leaves, some of which last until February; for their flowers, which are often fragrant; for their fruit, which in different kinds is black, red and white. Ledebour's, Standish's, White and Red Tartarian Honeysuckles are among the best. The Honeysuckles, both vines and shrubs, are easily raised from seeds. Standish's bears sweet-scented flowers before the leaves appear—often indeed in Mid-winter during warm periods.

The Philadelphus (Syringa or Mock Orange) is a large shrub, bearing white, fragrant flowers from June 1st till the 20th, varying, of course, with the season. We have raised a number from seed, but the seedlings are much the same as their parents. The Garland Syringa (P. coronarius) is perhaps the best. There is a variety of this with partially double flowers.

The Japan Kerria (double-flowered), or Globe-flower, is well known in most gardens, bearing its yellow "roses" from April to July. The bark is of a lively green color.

The Double-Flowering Plum (Prunus triloba) is magnificent for a day or so while in bloom. We have never observed anything else about it that deserves praise.

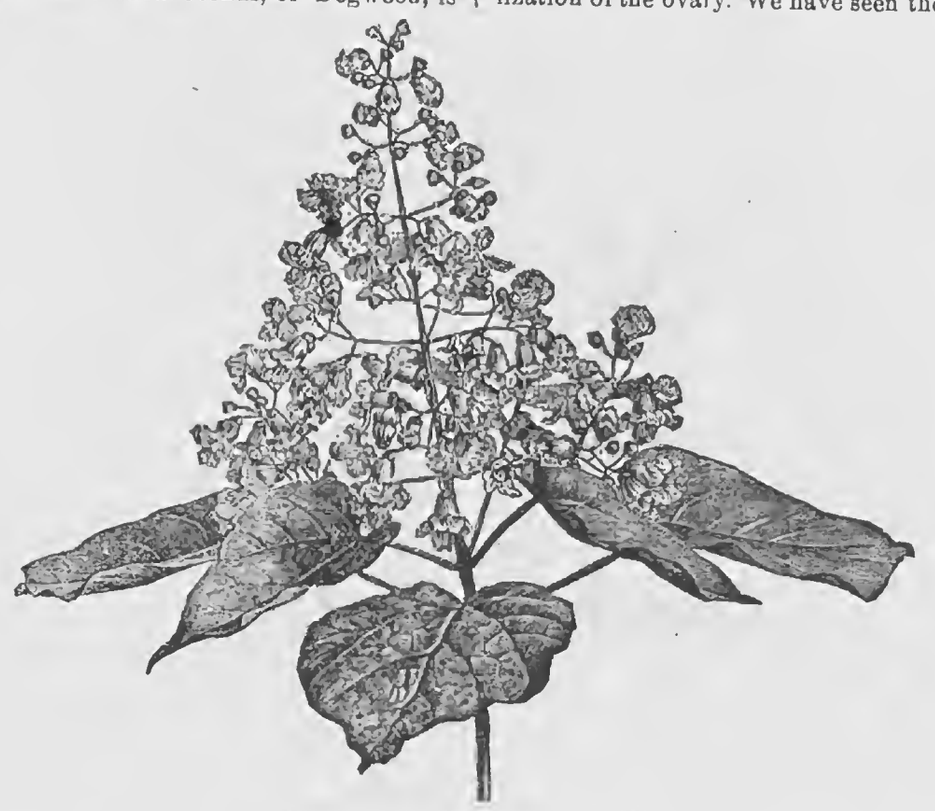
Rhus Cotinus receives justice elsewhere in this number. This is the Smoke or Purple Fringe-Tree. There are thousands of people who have this shrub growing on their grounds, that have little idea of its varied, changing, exquisite beauty under good treatment.

Should the lilac be forgotten? Yes, we answer, if it is not deemed worthy of better places and care than are usually given it. The lilac is always neglected, and yet there is no shrub that more heartily responds to care. There are few pleasanter sights in Spring than an assortment of different-colored lilacs in full bloom. The colors are white, lilac, reddish-purple and bluish-purple.

The Barberry works in very nicely among taller-growing shrubs. Its orange blossoms of early Summer or late Spring, its berries in the Fall and its leaves all the while are interesting and pretty.

The Sweet-scented Shrub bears queer flowers of a chocolate color and a fruit odor. It grows very well under other trees. This is easily raised from seed, though it does not always bear fruit from which to procure the seed.

The Red-Branched Cornus, or Dogwood, is



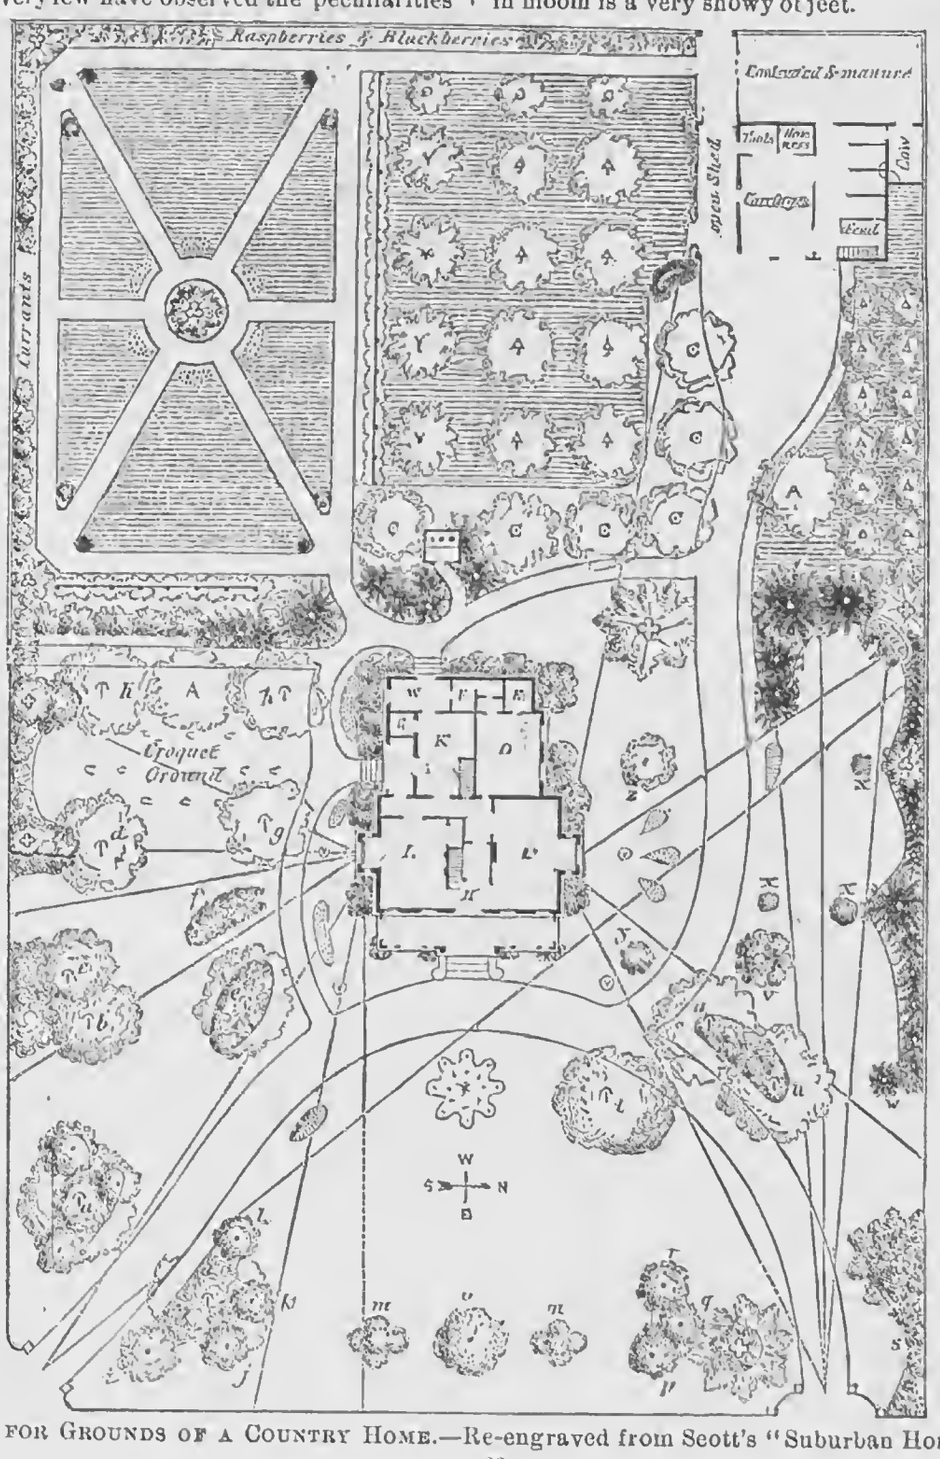
CATALPA BIGNONIOIDES.—FIG. 65.

desirable for its blood-red stems of Mid-winter, if for no other reason. By early May the branches lose entirely their blood-red color and become of a dull greenish-yellow, like willows in early Spring. The shrub is in full bloom by about June 1st, and the flowers are very showy from numbers, though individually small.

Broad-Leaved Evergreen Shrubs.

KALMIA LATIFOLIA, the Calico-Bush or Mountain Laurel, is found in damp woods or rocky soils from Maine southward. May we not call this the queen of evergreen shrubs? The foliage is leathery, dark-green, and, if the shrub is properly pruned, rich and ample. The flowers are singularly constructed, and it is a remarkable fact that though everybody has seen or gathered the flowers of the Calico Bush, very few have observed the peculiarities to which we refer. Near the top of the tube of the flower is a distinct line of crimson or rose. The anthers, upon curved filaments, rest in 10 cavities or little niches or pockets, which on the outside of the flower form so many spurs, or protuberances. Above these pockets on the inside are 10 dark-red spots. These spots and lines give it a calico look, and have no doubt suggested the name. The anthers rest in the pockets while the flower is in the bud. When it unfolds, the anthers are carried outward and downward, which curves the filaments (stalks of the stamens) like a drawn bow, until finally the corolla has so far expanded as to liberate the anthers. They then shoot off, generally striking the stigma of the pistil with one or more pollen masses, thus pollenating it and accomplishing the first step towards the fertilization of the ovary. We have seen the pollen projected from the anthers, from the elasticity of the spring, two feet or more. It has been said that the liberation of the stamens at the right time for fertilizing purposes was due to insects in search of honey. But any one who will watch and wait among blooming kalmias will find that they will all shoot and project the pollen without the insect aid.

The color of the flowers varies from white, through rose, to light red. The *buds* are generally of a deep rose color, one eighth of an inch in diameter, much resembling little furrowed, conical crowns. As they unfold they become whiter. Nearly every branch terminates with a corymb of flowers. Each corymb consists of from three to six umbels of from five to fifteen flowers, so that the entire bush in bloom is a very showy object.



PLAN FOR GROUNDS OF A COUNTRY HOME.—Re-engraved from Scott's "Suburban Homes." FIG. 66.

It is next to impossible to transplant wild plants unless it is rightly done. They should be taken up with as much soil as practicable and all of the fibrous roots it is possible to obtain. When there is no soil preserved and the roots are mutilated, the tops, stems and leaves *must* be cut off.

Rhododendrons need no praise. But the improved kinds cannot be considered hardy north of this latitude, and, as they require somewhat careful treatment even when they *are* hardy, we must reluctantly pass them by as not adapted to our present purpose. Those who desire them, however, will find full lists in several of the catalogues elsewhere mentioned.

Trees.

If we were writing for grounds over one acre in extent, we should begin with the maples and place probably the Norway first. But this must be allowed too much space to be admitted, if variety here, as in more extensive grounds, should never be lost sight of. We have just been walking over these grounds, looking at and dwelling upon every tree that is here growing, or that we could recall in other places with a view to answering the question "Which do you prefer?" The question is not a fair one, or rather it is one which cannot be satisfactorily answered. Our regards are pretty equally divided between several, and if our soil, situation and climate were somewhat different, others might impress us still more favorably. *Among* the best, however, we do not hesitate to place,

THE YELLOW-WOOD—Cladrastis tinctoria or Virgilia lutea. It attains a hight of 30 feet with mature age and under favorable conditions. In 10 years small trees from the nursery will grow to be about 15 feet in hight by as many in breadth. The bark is smooth, gray and clean. The tree inclines to branch low, forming a roundish, though somewhat balloon-shaped head a little larger on one side than on the other—a defect easily corrected. The leaves are borne on switch-like petioles with a swollen base like a horse's foot. Under this the bud for the next year is concealed and protected for a greater part of the Winter. The leaflets are of a soft, pleasing shade of green—from seven to eleven upon each stalk—and of an ovate shape. They retain their fresh green in all its purity until Fall when they change to a golden color—the lower ones first. The leaves fully clothe the graceful form and set off strikingly the pendulous racemes of white, pea-shaped flowers, drooping from the ends of the branches a foot in length. The Yellow-Wood leafs out about May 1st and blooms in May and June.

THE EUROPEAN PURPLE BEECH (Fagus sylvatica purpurea) is one of the most brilliantly beautiful trees that we have any knowledge of, and were it not that it is by no means easy to transplant successfully, or rather to establish in new quarters, we should unqualifiedly recommend it to every reader. We learn that there are many places where no such trouble is experienced; but even in the other cases the beauty of the tree can hardly fail to compensate for many failures. The buds break about the first of May, and by the middle, the tree is in its fullest beauty, lasting until July, when the bright purple changes to a deep green which is itself peculiar and pleasing. Again in the Fall, the purple color returns. There is a great difference in different trees of the so-called Purple Beech. We have seen specimens that were not deserving of the name. The variety known as Rivers's Purple Beech is that which we should advise our readers to select.

THE WEEPING BEECH (Fagus sylvatica pendula) is a tree of world-wide celebrity. A coarse, but true sketch of the beautiful specimen on the grounds of Mr. Parsons, of Flushing, as it appears in Winter, was given in the RURAL of June 29, '78. The present sketch is re-engraved from Mr. F. J. Scott's fine work entitled "Suburban Home Grounds" "Grandly eccentric"—"the most curious tree of our zone"—"a great mound of dark-green, glossy leaves"—"a gigantic bower of vines"—are phrases which have been applied to this Weeping Beech.

Our best specimen is now seven years old from the nursery, and is 12 feet high. We have been told that not until it has been 10 years transplanted does it begin to assume its beautiful eccentricities. The Parsons' Beech is now about 40 years of age, and is about 40 feet in hight. It is, indeed, the very embodiment of all the odd freaks of growth that make trees picturesque and of the vigorous healthfulness of foliage that makes them beautiful.

THE MAPLES.—As a class of trees for ornamental purposes, the maples are doubtless entitled to rank first, and there are several species among them of which as individuals the same might be said. While in this special number of the RURAL NEW-YORKER we cannot dwell upon the different kinds, we may at least designate those which seem to be the best suited to grounds of about an acre in extent. First let us mention

The Dissected-leaf Maple—Acer platanoides dissectum, is a synonym for one of the Japan species, viz., palmatum; sometimes called polymorphum. But this is evidently a seedling of the Norway, as shown in many ways, conspicuously by the buds and leaves. But the leaves are more deeply cut. Our only specimen is now six years old from the nursery, and it is not six feet high. But it is full of vigor, shaping itself into a round-headed, com-

pact tree that, with its singularly cut leaves' everybody that sees it admires.

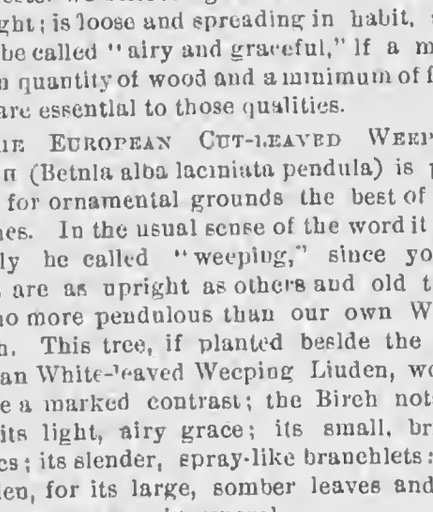
The Silver Maple (Acer dasycarpum) is one of the trees which persons who are in haste for foliage and shade usually select Its leaves are prettily cut and their silvery color contrasts well with leaves of a deeper hue. For small places, however, we should omit this in our selection. There is too much wood about it. The branches are too long and spreading. We have tried cutting it back severely, but its growth has been so rapid afterwards that the branches would break almost of their own weight.

The Sugar and Scarlet Maples are, it seems to us, far more desirable in many ways. There are also several variegated maples of which that called Acer tricolor is the most permanent and decided of any with which we are acquainted. There is a new variety of the Silver Maple originated by Mr. Weir and called Weir's Cut-leaved Silver Maple. Ellwanger & Barry, who introduced the tree a few years ago, speak of it as possessing a habit almost as graceful as that of the Cut-leaved Birch, and as being easily adapted to small places, if occasionally cut back. Engraving of the leaf, p. 97.

SALISBURIA ADIANTIFOLIA.—Gingko or Maiden-hair tree. This is in a marked manner different from all other trees; and this difference, viewed as to its ornamental qualities at least—is in the leaves, which are fan-shaped, leathery, parallel-veined and of a dull green color. The leaves are as if fifty or more of the "needles" of the White Pine had been flattened and pressed together into one. It combines several of the qualities of the cone-bearing with those of deciduous trees, and so is said to be a connecting link between the two. It is said to be a rapid grower and to be improved by cutting back occasionally, which statements are not supported by our own specimen, which, though it has been growing in its present place for eight years, is but nine feet high. It was cut back the second year, from the bad effect of which it was slow to recover. Aside from its really curious and beautiful leaves and the botanical interest which attaches to the tree, we see very little about the Gingko to commend it to general use. It bears no flowers in this country and, of course, no fruit. The leaves appear not until the middle of May and they are dropped early in Fall—points which must have escaped Downing and other writers when they selected near the house as the appropriate position for this tree. It is a native of Japan; quite hardy here—and in Rochester we believe—grows from 35 to 75 feet in hight; is loose and spreading in habit, and may be called "airy and graceful," if a maximum quantity of wood and a minimum of foliage are essential to those qualities.

THE EUROPEAN CUT-LEAVED WEEPING BIRCH (Betula alba laciniata pendula) is perhaps for ornamental grounds the best of the birches. In the usual sense of the word it can hardly be called "weeping," since young trees are as upright as others and old trees are no more pendulous than our own White Birch. This tree, if planted beside the European White-leaved Weeping Linden, would make a marked contrast; the Birch notable for its light, airy grace; its small, bright leaves; its slender, spray-like branchlets: the Linden, for its large, somber leaves and its heavy appearance in general.

We have found the Cut-leaved Weeping Birch of rather slow growth from the time it was planted in these grounds until now—a period of eight years. It is now about 15 feet in hight, though cut back three years ago two feet or more, to induce a more stocky growth. This birch is a very pretty tree as we have seen it in other grounds, and, except that branches die out occasionally from the attacks of an insect which bores the stem and that it is not very long-lived, it is in every way to be commended.



AS A TREE SHOULD BE PLANTED.—FIG. 67.

Of late years a variety of the White Birch with purple foliage has been introduced. The leaves are as deeply colored as those of the Purple Beech and they retain this color just as well. The contrast between such foliage and the white stems hightens its beauty. This "Blood Birch," as it has been called, has not thus far proved hardy here, losing during the cold season the entire growth of the Summer.

We pass by the lindens as not well adapted to our present purpose. The oaks would need a Special Number to themselves to touch upon their striking dissimilarities and several merits. Among all of them, however, there are very few kinds, which, for our acre we should prefer to the other trees mentioned in these notes. We may, however, speak a good word for the Golden Oak which is treated more at length by Mr. Parsons. It has here proven of rapid growth through four years, entirely hardy, and its leaves in early Spring are of the richest golden color. A part of this reappears in the Fall.

THE LIQUIDAMBAR, OR SWEET GUM.—L. Styraciflua. The very name has always had a charm for us, and there is that about the tree—in its star-shaped fragrant leaves; its queer corky bark; its shapely, elegant form—that hightens the charm and really inspires a feeling of attachment. It is found in moist woods from Connecticut to Illinois and southward, but our readers must not, therefore, conclude it will thrive only in moist soils. One of the best specimens we have ever seen grows in a sandy soil with a sandy sub-soil so little retentive of moisture that the grass burns up in the Summer. In fact, it may be said there *are* no trees which will not grow to finer proportions in a well-drained soil than in one upon which water stands or from which it slowly disappears. The superb hues which liquidambar foliage assumes in Autumn, are referred to in another place. The sexes are in different flowers (see illustration). This is not an easy tree to transplant. As in the case of the tulip, young trees should be selected and, unless the roots are uninjured, the stems should be severely cut back.

THE SWEET BUCKEYE (Æsculus flava) as it grows here is one of our handsomest lawn trees. It has been cut back for several years and is now sufficiently supplied with secondary branches to conceal by its large, smooth, glossy leaves, the heavier branches which, in specimens not cut back, are prejudicial to its appearance. The flowers are borne in long racemes of yellowish-white flowers which are not so showy as those of the white or red. The new growth surprises one with its rapidity. One day we find the buds just breaking, while in a few days after, the new shoots are a foot in length, and the sudden increase in the size of the tree surprises the beholder. There are few trees that surpass it in freshness, symmetry or general beauty. It blooms in middle-May.

But all of the horse-chestnuts are noble trees and their hyacinth-like flowers, if their foliage were but ordinary, would suffice to command a fair share of admiration. There are a double-flowered white, and a double-flowered red; there is a variety with narrowly cut and crimped leaves; another with the leaves dotted with white, all of which may be found in the catalogues of our nurserymen.

We have faint praise to bestow upon the willows in general. A Weeping Willow (S. Babylonica) is, to our view, entirely out of place about a country home. It requires too much space; it is too infested with insects; too short-lived; too sorrowful-looking.

THE ROSEMARY-LEAVED WILLOW, if cut back every year, forms a round, compact head of narrow leaves, that some may admire; but if left unpruned it loses every vestige of beauty in a few years.

THE LAUREL-LEAVED WILLOW (Salix pentandra) (?) is the only willow we should prize about our home. This has been disseminated by the RURAL NEW-YORKER, and our old readers have little to learn regarding it. It thrives everywhere. Its leaves are of the glossiest, reflecting the light almost like mirrors. Its long, smooth branches sway in the wind as if they would be broken in pieces, though they never are. It is one of the first to unfold its leaves in Spring, and one of the last to lose them in the Fall. It may be cut back to any extent without harm, though if left to itself it forms a small pyramidal tree 20 feet or more in hight, full of a graceful elasticity, and nearly all that could be desired in a tree that is necessarily somewhat formal in its habit.

Magnolias.

The large leaves of tropical vegetation are the admiration of Northern people. Hence we

THE HEMLOCK SPRUCE—AFTER SCOTT.—FIG. 69.

have Summer beds which we call "tropical," and no end of pains is taken to cultivate the canna, ricinus, calladium, etc., all for their leaves. Why has it not occurred to all that there are kinds of magnolias that rival those tender plants in luxuriance of leaf and form, while they bear flowers almost unrivaled for size, beauty and even fragrance! We would not, could not, be without magnolias—bless them! They have a grand beauty all their own.

We know not how far north of New York LENNE'S MAGNOLIA is hardy. But for this place we prize it as the choicest of the low-growing kinds. Soulange's Magnolia has been considered the best of the foreign kinds; but Lennei (a supposed hybrid between Conspicua and Purpurea) is in several important respects to be preferred. Foremost is the fact that it is hardier. While the stems and flower buds of Soulange's have been harmed during the cold season, those of Lenné's have not been touched. The flowers are a dark reddish-purple (claret) outside and nearly white within. It blooms about the first of May, and previous notes show that we have counted upon a single specimen, but five feet high, fifty flowers more or less opened, while half as many buds were at the time still to unfold. This was before the leaves were much developed. But occasional flowers appear during the entire season. In August we counted upon the same tree 15 buds, six of which were showing the petals. These flowers continue until frosts. They are very large—at least six inches across—with nine petals of a balloon shape about four inches long. The leaves are firm and leathery, of an obovate shape, acuminate at both ends, and about eight inches in length, and generally suffused with a bronze color of great richness. The little tree grows rapidly, four-year-old plants being eight feet in hight and oft-times blooming two years after being grafted. A new magnolia called

M. STELLATA should have been mentioned under shrubs, since, judging from our own specimen, it can scarcely ever hope to attain a size which would entitle it to the name of a tree. It bears small white, fragrant flowers of several rows of petals early in the Spring, and is a charming little scrubby, branching object.

THE CUCUMBER TREE (Magnolia acuminata), is a native of many States of the Union, and grows to a hight of 75 feet or more. But it may easily be restrained by a free use of the pruning knife, which will at the same time greatly improve its appearance by giving it a more compact form and a closer spread of leaves. The flowers appear in June, of a pallish-yellow color with a faint fragrance. The fruit, about three inches long, resembles a cucumber, whence the name. It gives to nurserymen the stock upon which most of the other species of magnolia are worked.

MAGNOLIA GLAUCA is the Sweet Bay, and is nearly evergreen here, and, like M. grandiflora, completely so in the South. It forms a small tree bearing wax-like, white flowers, three inches broad, which perfume the air in the swamps where they bloom. It is found wild from Massachusetts to Florida near the coast, and thrives in any garden soil not too sandy.

MAGNOLIA FRASERI—The Ear-Leaved Magnolia, is found in Virginia and Kentucky and southward, though sparingly. It flowers in June, bearing yellowish flowers, and sometimes again in Autumn. It forms a small tree, never very shapely, with large leaves, ear-shaped at base (hence M. auriculata of some), about 10 inches long, clustered at the summit of the branches. The flowers, though large, are loose and short-lived, lasting but two days.

MAGNOLIA GRANDIFLORA, the Great Laurel Magnolia of the Southern States and the Queen of large-leaved evergreen trees, is world-renowned for its majestic beauty, for its sweetly-scented flowers and shiny, thick leaves. It is not hardy north of Virginia.

HEART-LEAVED MAGNOLIA (cordata) is a good deal like M. acuminata, though the leaves are not so large and the tree never grows so tall. The leaves are four to six inches long; flowers (in May) four inches wide, of a yellowish color. This is hardy as far North as Wisconsin and Massachusetts—possibly further North. The

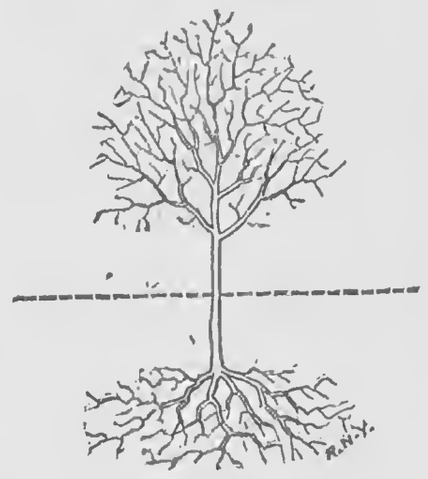
UMBRELLA TREE (M. umbrella or tripetala) is of rapid growth, small size (say 20 feet), bearing leaves often two feet long and an abundance of large, white flowers in May or early June. The petals are three to four inches long, narrow and elliptical, without fragrance and partly closing at night. The fruit forms in beautiful rose-colored cones of an oblong shape, four or five inches long, a very valuable quality of this tree. Left to itself, it sends up several shoots from the main stem near the ground, or from the root, which if permitted to remain, change the character of the plant from a tree-form to a spreading bush. This native tree is hardy in Ohio, Southern Michigan, Iowa, etc.

As a *tropical* tree, though not quite hardy north of Southern New York, the

GREAT LEAVED MAGNOLIA—M. macrophylla—stands quite unrivaled. The leaves sometimes measure 40 inches in length, while the immense flowers are often one foot in diameter. They are of a bell shape, nearly white, with a dark-purplish spot at the base, and fragrant. This tree grows rapidly, finally attaining a hight of 20 feet or more. We have just been examining the leaf buds of our specimen. They are three or four inches long and, though snugly folded up, are green in color and so naked and exposed that we wonder how they can stand the icy storm that prevails; the 19 deg. below zero which prevailed in this valley but a few days ago. This magnolia blooms in June; is found wild in Kentucky, North Carolina and, we believe, southward. It is one of the easiest of the family to transplant.

There are many other magnolias—some of them new—which for one reason or another we have not mentioned. Our readers should be advised that all of the magnolias are difficult to transplant. Either they must be grown in pots or have been often transplanted in the nursery grounds, to insure a fair measure of success. Exposure of the roots to wind or sun *must be* carefully avoided. They will not stand transplanting in the Fall in this climate, or indeed too early in the Spring.

PICTURE THIS LANDSCAPE WITHOUT TREES OR SHRUBS.—FIG. 68.



PLANTED TOO DEEP.—FIG. 70.

CATALPA—INDIAN BEAN. Of all quick-growing trees, we should choose this—the Catalpa bignonioides of botanists. It is, we think, for this purpose, in every way, preferable to the Silver Maple remarked upon above. It is more spreading in its habit; the leaves are larger; the flowers are no less handsome than those of the Horse-chestnut. It will not however, stand the Winters north of New York. A variety called Speciosa of late years has been much talked of. It would seem, from excellent testimony, to be hardier than the species, and to differ from it in flower and in the character of its growth. See illustration, page 99.

Evergreens.

We must not in planting our acre forget *evergreens*—those "friends indeed" that cheer us when all besides is bare and shivering, and we have but them to depend upon for a bright relief to the cold, cheerless landscape about us. These should be so distributed among the deciduous-leaved plants as to provide, as it were, a Winter garden. We should not, therefore, as is often done, separate the one kind from the other. It is an easy matter so to intersperse them that the deciduous trees may be the more prominent in Summer, while, as their leaves fall in Autumn, the evergreens seem to march into their places and supply the loss.

With hardy evergreens, as with deciduous plants, we are constrained to confine ourselves to a reference to the few that are admirable rather than dwell on the many which are desirable; and our readers should benevolently bear in mind that "tastes differ," and that what is most prized at the "Rural Grounds" might, for a number of reasons, be looked upon indifferently elsewhere. Of all evergreens, our choice is

THE HEMLOCK SPRUCE (Abies Canadensis) although, unfortunately, it can never be of service to our Southern friends. The prettiest hedge, by far, that we have ever seen was one of this hemlock, and the nearest approach to perfection in single trees are several specimens we recall in different parts of the country. Most of the sprnces are stiff, unyielding, formal; so are most of the pines and firs. But the Hemlock Spruce is as graceful, light and airy as a willow; while its leaves in Winter are as green as those of any other conifer. We have specimens which we have cut back. This changes the form from one that is naturally conical, as shown in the cut, to one that is oblong, dwarfing the tree in hight by what it adds to the spread of the lateral branches. There are several varieties which, though very valuable in a collection, are not, as single plants, equal to the species. One is the Weeping Hemlock; another, the Broad-leaved, and another, the Little-leaved Hemlock.

CALICO BUSH—(KALMIA LATIFOLIA.)—FIG. 71.

Should we mention the Norway Spruce next, and then the Balsam Fir? No, we do not propose to mention these two popular trees for our acre at all. We cannot look at our many other kinds of spruce without the conviction that they are decidedly superior to the former, and must, as time permits, take its place for ornamental grounds. As for the Balsam Fir, bright as it is during youth, it begins to lose its beauty when 12 years of age, and is ugly in most cases at 16.

THE ORIENTAL SPRUCE (Abies orientalis) is far better adapted to small grounds than the Norway. It is hardier, never being injured here as the Norway is upon those of its lower branches exposed to the northwest. Its foliage is probably more compact than that of any other spruce which attains to its size, which is, as we learn, not over 60 feet at its best. We have seen but one tree of this species, that was old enough to display its mature habit, and that, we think, is one of the finest evergreen sprnces of any kind we have ever beheld. It is solid, heavy, dark, with none of the horizontal layers of branches which characterize the Norway.

The oddest evergreen that we know of is a seedling of the Norway called the

CONICAL SPRUCE, and it is odd for its singular regularity. It could not with the shears be cut into a more perfectly conical shape than is the specimen growing in these grounds. The branches grow closely together so that it is compact and the color of the leaves is brighter than that of the species. It is mentioned as a dwarf spruce, but ours is now growing at the rate of nine inches a season, so that it bids fair to become a sizable tree in a few years. Speaking of dwarfs,

GREGORY'S SPRUCE, also a seedling of the Norway, is one to be recommended. The branches grow so closely together that were it not for the sharpness of the leaves one might sit upon the rounded headed as upon a cushion. Our specimen, seven years from the nursery, is now two feet high and four broad.

THE INVERTED SPRUCE, another variety of the Norway, is remarkable from the fact that the branches grow almost directly downwards. We are not aware that there are any specimens of this taller than seven or eight feet. Our only plant, seven years from the nursery, is now between four and five feet in hight. Among the newer evergreen trees of high promise are

ROSE OF SHARON—(HIBISCUS SYRIACUS.)—FIG. 72.

ENGELMANN'S AND MENZIES'S SPRUCES. What they may become ten years hence we cannot say. They have thus far proved extremely hardy, and their sharp leaves, which are of a steel or grayish-green color, more especially those of Engelmann's, contrast well with the darker-foliaged evergreens behind them. Respecting this gray or blnish tint, seedlings vary and it is a question how long this pleasing shade will remain. These two trees, and also the Douglas Spruce, are natives of the Rocky Mountains, and it is only within a few years past that we have known that by seedling cultivation we could raise plants which would endure the climate of the north. The Norway Spruce is often used for hedges, but, on account of the more rigid, pointed leaves of Menzies's Spruce, we should think when it can be sold so low that it would be used for that purpose instead of the Norway.

THE SWISS STONE PINE (Pinus Cembra) among the pines is of slow sturdy growth very distinct in appearance. One thing in its favor is that it will grow in very poor soils and in almost any situation.

For the furthest corners of our acre of ground, we may plant one or more of the Scotch Pine, which by disbudding in Summer can be forced into a much closer and handsomer form than that it naturally assumes. These vary in their silvery appearance owing, many think, to the soil. But we should select from the nurseries those showing most decidedly the silvery color.

THE WHITE PINE, treated as pointed out in another place, is well worthy of more frequent employment.

THE JAPAN RETINOSPORAS.—Of these the Golden Retinospora, (R. plumosa aurea.) has now been well tried and found wanting in no respect that we know of. It is a dwarf plant with very dense, flexible, feathery branches. In Spring and Summer the new growth is of a very delicate, pleasing light green. This in Autumn changes to a yellow color, so remaining during the entire Winter. A variety with silver variegation is less desirable, the silver leaves looking in Winter rather dull or discolored above the snow. Both, however, are very hardy.

Retinospora obtusa and pisifera are beautiful evergreen trees, and have stood our Winters through six years. But we hesitate to recommend them to our readers, for the reason that, being comparatively new in this country, they have not been tested under the widely different conditions which such a recommendation would subject them to.

We must not forget, while considering evergreen trees, the

AMERICAN ARBOR VITÆ.—True, its Winter color is not so bright as that of a few other conifers, but, when compared side by side, the difference is not so great as might be supposed. True, its form is not spreading, and, whether left to grow naturally or cut back, it still assumes a monumental, formal appearance. Nevertheless, a specimen here and there helps to make up *variety*, which in our selection of plants should never be lost sight of. From the window at which we write may be seen several arbor-vitæs 15 feet in hight, of such a narrowly conical shape that they are scarcely wider than one's body, at their base. One specimen, which has been cut back occasionally, is of an egg-shape, the broader end resting nearly upon the ground. Another, which has been cut back to within 18 inches of the ground every year, spreads out in a circle about eight feet in diameter.

The American Arbor-vitæ is easily transplanted, grows rapidly, will bear any amount of pruning, is easily propagated, is very hardy and requires but little space; for which reasons, if not too freely used, it is especially well suited to small places.

ABIES POLITA.—This is a new, very distinct Japan Spruce with leaves three quarters of an inch long, which are stiff and sharp as needles. It has proven with us extremely hardy and of quite fast growth. Why would not this serve as well for hedges as the arbor-vitæ, Norway Spruce, locust or Osage Orange? It would certainly prove as effectual in turning animals as either.

FOUR HANDSOME SHRUBS.

C. M. HOVEY.

VIBURNUM PLICATUM.—Everybody admired the snow-ball so common in old gardens, where its huge balls of snowy whiteness were so ornamental and contrasted so well with that other old and neglected shrub, the lilac. But its proneness to attacks of insects, which spoiled its foliage, caused it to be overlooked. This new Japan species not only has clusters of the whitest blossoms quite as beautiful, but its thick plicated foliage is also very handsome, and with its free flowering qualities renders it a grand substitute for our old cospecies, and one which should find a place in the smallest collection.

HYDRANGEA PANICULATA GRANDIFLORA.—Perhaps this may be too well known to need further mention or commendation, ranking, as it justly does, among the best of all shrubs, new or old. For a small or large garden, for an eight by ten yard city plot, or a demesne of 50 acres, it is equally well adapted; or indeed, for pot culture for the lawn or as a standard or dwarf. Easy to transplant, free to grow, perfectly hardy, abundant in bloom, and massive in its great heads of white flowers, which bend to the ground, fading off to a pinkish tinge, it must claim the most prominent place in every garden.

EXOCHORDA GRANDIFLORA.—While the hydrangea exhibits the massive beauty of flowers, this lovely shrub may be said to show all that is delicate and refined. Its growth is slender and regular, and the profusion with which it garlands every little twig with the whitest of blossoms surmounted with the pearliest of buds, makes it a fit companion for the most *recherché* of greenhouse plants. Indeed, it is difficult to imagine a more attractive object than an Exochorda about five feet high, in full bloom. It is not so easy of propagation as we could wish, but it well makes up for this slight defect, which will cause it to be less common than it otherwise would.

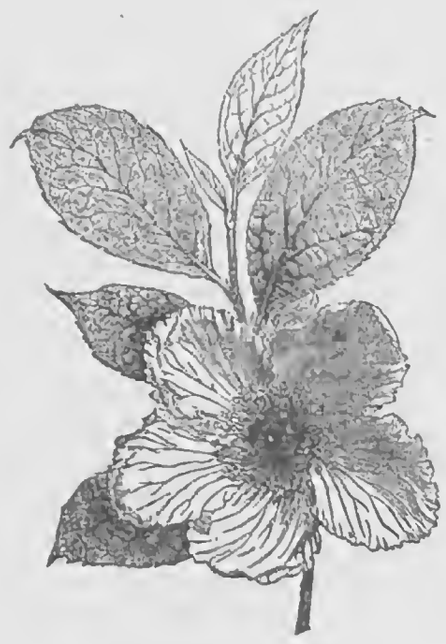
AZALEA MOLLIS.—What a grand acquisition! We thought the Ghent Azaleas, as they are called, were beautiful enough, as in fact, they are. But this Japan species treads close upon them, if it does not surpass them. For size of bloom and freeness of flower in a young state, they certainly are their superiors. What they will do as they acquire age remains to be seen. They are certainly lacking in fragrance; but with the knowledge of what has been done in improving the Ghent Azaleas, we may expect equal, or greater, results with this Japan species. For massing for small beds, they have no equal not only in profusion of bloom, but in the varied and novel tints of apricot, orange, amber, lemon and yellow. Truly, Japan has been prolific in garden treasures.

Boston, Mass.

A SELECTION OF THE BEST HARDY PLANTS.

SAMUEL PARSONS.

THE editor of the RURAL has asked me to



STUARTIA VIRGINICA.—FIG. 73.

name, and give reasons for naming, the five best deciduous trees, the five best deciduous shrubs, and the five best evergreens for a lawn of, say, an acre in extent. That means, I understand, that I must select this number of plants as well as I can from a general collection of favorites comprising many more varieties; for I should be sorry to confine my lawn-planting efforts to only fifteen kinds of hardy plants. Such a restriction would necessitate my sacrificing the enjoyment of too many interesting varieties. If I must, then, select only fifteen kinds (and I am loath to thus dishonor by neglect a score of others), I will take only varieties that are *every-day plants*, hardy, enduring, and vigorous in growth and striking and effective in color and form. They must not be novelties, they must not be small, exquisite gems; but their beauty must be useful in the highest practical as well as artistic sense, useful to the economical farmer as well as to the rich owner of parks or lawns.

Best Five Deciduous Trees.

THE NORWAY MAPLE—Acer platanoides. That I should pass over the American Elm, the Sugar Maple and the White and Pin Oaks may surprise some; but I choose the Norway Maple because it is a richly endowed tree in all ways, both practical and ornamental. It is not only beautiful with its large, shadowy, rich green foliage piled in broad, rounded masses; but it has excellent every-day qualities in the way of hardiness in all exposures, moderate and yet vigorous growth, and, above all, a regular, healthy habit that retains it many years in shapeliness and beauty with little or no pruning. One scarcely ever sees the Norway Maple exhibiting its full beauty on the lawn, because it is scarcely ever allowed to grow branches from the very ground upward. People have an unfortunate fancy for trimming up lawn-trees. If left to itself the Norway Maple spreads out into a globe of massive green foliage of the most unique and imposing character. It is, moreover, an excellent shade tree on wide avenues, for it needs room to spread abroad its massive foliage.

LIQUIDAMBAR.—(After the London Garden.) FIG. 74.

WHEATLEY'S ENGLISH ELM—Ulmus campestris Wheatleyii. It will doubtless seem strange to many that I should pass over the American Elm for an English Elm, when it is well known that the English Elm is not popular in America; but remember I am selecting lawn trees and not street trees. The American Elm is somewhat coarse and too spreading in habit to suit a place of only an acre in extent. As an element of landscape-gardening effect, the European Elm is invaluable for the picturesque way in which a mature tree piles rounded masses of foliage one upon the other. It is lofty, too, and even spirey on occasion. This Wheatley's Elm, for instance, will grow six feet during the first two years after grafting, which is no bad growth for any elm. Then the American Elm loses its leaves early in Autumn, while Wheatley's Elm holds its foliage particularly late. The foliage of the latter is rich and effective and the form erect and pyramidal. It is, indeed, in many respects, only an excellent variety of the ordinary English Elm, but its excellence is so great that I believe it fully worthy of the high rank I have given it. We neglect these European Elms on our lawns unjustly.

THE PURPLE BEECH—Fagus sylvatica atropurpurea. All kinds of beeches are alike beautiful in foliage, branching and trunk formation. They are slow-growing, long-lived and richly and even exquisitely endowed in every way. Their shade is unsurpassed, and they frequently hold their foliage far into December. The Purple Beech, however, is shapely, pyramidal and sometimes spreading, an elegant and stately tree. It is unquestionably the most attractive purple-leaved tree known on our lawns. The variety, Rivers's Purple, is the richest in coloring, and in May and June the young growth, seen against the sun, fairly glows with the most splendid rosy tints.

THE WEEPING BEECH.—Excellence of form rather than special beauty of foliage characterizes this tree, although the leaves of all beeches are very beautiful. The behavior of the branches of the Weeping Beech is literally wonderful. They curve and weep in every shape imaginable, and reach up and down and about in the most grotesque, and yet graceful manner. Always beautiful, the Weeping Beech is now merely pointed and drooping and again entirely cathedral-like and spreading—altogether the most splendidly endowed ornamental tree on the lawn.

THE RED-FLOWERING HORSE-CHESTNUT. I hesitate, I acknowledge, in choosing the fifth tree. It is the last chance and there are so

many one would like to select. Magnolias should not be passed over; but, then, they are difficult to transplant. The Weeping Sophora and Gingko are most curious and interesting trees. What shall I do? At the risk of being unjust, I will name the Red-flowering Horse-chestnut. It is, at least, a striking, hardy tree of recognized value. A round mass of large, finely-tinted, light-green leaves is set all over in May with veritable bouquets of rose-colored flowers. The combination of foliage and bloom is unique in appearance, and loses none of its beauty as we examine it more closely. The tree itself is medium-sized and vigorous-looking though slow and regular in growth. It has always been choice and rare; but to be effective it must be grafted on a stem five to six feet high. The Red flowering Horse-chestnut is entirely hardy, but much prefers low ground. It will do well, however, on level, rich, loamy soil. At a considerable distance on the lawn this tree, with its rounded, massive, light-green foliage and prominent red flowers, continues to be very striking.

The Best Five Deciduous Shrubs.

THE JAPANESE SNOW-BALL. This Snow-ball has been accorded, in the RURAL NEW-YORKER, for September 21, '78, the highest rank among deciduous shrubs by a majority vote of the best judges. Nor can any one fail, one would think, to recognize at a glance its great excellence, and experience will only serve to confirm the correctness in this case of first impressions. Its round balls of flowers are white and solid and very unique and charming, and the dark-green, crinkled or plaited leaves and brownish shoots piled in picturesque masses, impress one even at a distance, and near-by their excellence is not impaired by anything coarse or unattractive. It remains beautiful in foliage or flowers, as the case may be, throughout the season, and is always specially effective. The flowers hang on sometimes six weeks, and then drop off undecayed. Its dense masses of foliage are, however, rendered doubly picturesque by systematic pruning.

HYDRANGEA PANICULATA GRANDIFLORA. This plant has been awarded very high, if not the highest praise among shrubs; but is none the less coarse in appearance on close examination. Yet its great, bending trusses of flowers a foot long, changing from white to red and crimson until frost turns all a pale-brown tint, alone entitle it to high rank among a selection of the best shrubs. It grows vigorously, is perfectly hardy, and very imposing at a distance. Unquestionably a group of these hydrangeas is one of the most splendid features to be seen on any lawn. Remember, too, it is an autumn-blooming shrub, which is a significant fact when we consider that there are very few fall-blooming shrubs, and none approaching this hydrangea in excellence.

EUONYMUS EUROPÆUS. The lawn wants bright-color effects sadly in Autumn before the leaves of maples and oaks brighten with incipient decay. I choose, therefore, the Euonymus as one of my five shrubs for its abundant display of showy scarlet berries, although in strictest sense it is a small tree. Its foliage and erect and positive form are alike beautiful. The leaves, retained late in Autumn, are shining-green, and its reddish-brown branches are adorned in an indescribable manner by numberless large, scarlet, four-hooded seed vessels. No flowers could be finer or enliven the landscape more than the fruit of this well named Strawberry-Tree.

SPIRÆA THUNBERGII. For the finest spray-like effects of deciduous shrubs we must turn to S. Thunbergii. Early in May, and even in April, its masses of pure white wreathes of flowers rest or enfold the drooping, graceful branches, like drifting piles of snow. The small, dainty leaves come out fully only after the flowers disappear, and take on at once the most tender and delicate green. These leaves are numerous and very small. Later on in Autumn, when they hang late, the delicate beauty of their crimson-and-gold tints is very striking.

THE WHITE FRINGE—Chionanthus Virginica. I wish I could include the Japan Judas-tree and Stuartia pentagyna. They are unsurpassed in their way; but since I can only take five shrubs, their defective hardiness as compared with that of the White Fringe, must secure the honor to that plant. Chionanthus Virginica, or the White Fringe, becomes almost a tree in time—is actually a tree in strict parlance. It is of medium growth and has firm-looking, rounded contours and shining, effective foliage, very beautiful even without its flowers. But what a crown of glory its masses of lace-like, white flowers are in June, as they rest lightly on the rich, solid-looking foliage. Near-by the effect is delicate and exquisite; at a little distance it is an impressive and delightful surprise. Please note that I am particular to select shrubs which bloom at different seasons.

Best Five Evergreens.

THE CONICAL SPRUCE. Evergreens are perhaps less important in this climate than deciduous trees or shrubs, because they are harder to transplant and harder to keep alive after they are transplanted, beset, as they are, by the peculiar conditions of our American climates. The most popular of all the finer evergreens, although not neeessarily therefore the best, is the Conical Spruce. Its symmetry is its strong point, and perhaps the fact that it is a perfect form of the familiar and favorite Norway Spruce. It needs no prnning and does well in most situations; in fact, it behaves with credit where more exquisite hardy evergreens fail.

ENGELMANN'S SPRUCE. Another evergreen, as yet very little known but equally worthy of renown, is the Engelmann's Spruce. It is as hardy as the Conical Spruce, less symmetrical and more picturesque in outline, and, above all, luminously bluish or grayish-green. The contrast it affords to other evergreens would alone give it title to rank high on our list.

THE GOLDEN RETINOSPORA — Retinospora plumosa aurea. The special charm of this evergreen is its contrasting beauty. It is bright-golden all the year, deepening in yellowish tint towards Winter, and showing most green during the full growth of June. In habit it is picturesque, feathery and dense. It is very easily transplanted and is kept down by pruning to the most dwarf size without loss of beauty. Indeed, it must be thoroughly and regularly pruned to keep it fine and bushy. Hardy in most places and easily propagated, there are few, if any, of the new Japan evergreens that are likely to grow in popularity more in the future.

THE NORDMANN'S SILVER FIR. And now for our king of evergreens—Nordmann's Silver Fir! What can be more majestic, imposing, picturesque and symmetrical than its masses of dark-green foliage, with beautiful silver linings? Set out a tree that has been transplanted and pruned in some proper fashion, and you will find it the most magnificent and generally satisfactory evergreen on the lawn. It is slow-growing, and will long suit the dimensions of small places, if properly pruned, while it will equally well adorn the largest park.

THE WEEPING HEMLOCK. I close with what is, in some respects, the most beautiful of all evergreens. The common hemlock is sometimes, during youth and early growth, as beautiful in the form of its weeping sprays; but on the true Weeping Hemlock the most attractive of these forms is permanent. Add to this a peculiarly picturesque, evergreen, fountain-like form attained in mature age, and you certainly have an excellent evergreen. It still remains rare, though introduced by Mr. H. W. Sargent a score of years ago; but it is somewhat difficult to propagate, and therefore has not received as much notice from growers, as it would if it could be grown as readily as a Hovey's Arbor-vitæ or the Golden Retinospora.

GARDEN VINES.

WILLIAM FALCONER.

ORNAMENTAL VINES as garden plants are craved by poor and rich. They are for use as well as show; they give us shade in Summer, act as wind-breaks for more tender nurslings and screens to hide unsightly objects, rob the garden of a formal look, and with their drapery add a furnished show, and, where trees are wanting, serve well *pro tem.* as substitutes. And to their graceful forms and greenery is often added a wealth of lovely blossoms; for instance, clematises and roses, golden bells and clusters of wistaria. Most of them are of rapid growth, tough constitution, easy cultivation, and among them are subjects available for almost all positions. Poor, indeed, is the garden without a vine. The round-sheared shrubs, the closely-shaven lawn, the glowing beds and fancy fence cannot atone for those bare walls, that shadeless veranda, that naked porch, that unclad, green-painted lattice fence, set there to hide the back yard from the front. Vines give a cosy look unto a dwelling—a far more "homey" feeling than any vineless house can have.

Woody Vines

are the most useful, ornamental and permanent. They are especially available for covering long distances, such as the whole length of a house front or arbor; ascending to the tops of high pillars, their laterals depending all around in easy grace; or furnishing, in like manner, the long, bare trunks of trees. Once planted and in good soil, their after care consists in regulating and training the branches, and sometimes thinning and shortening them. In Europe house walls are often beautifully clad in ivy-fashion with pyracantha and the small-leaved cotoneaster, the shoots being tacked to the walls like vines. Both flourish under such circumstances and produce exceptionally large crops of flowers and showy fruits. Myrtles (Myrtus), Edwardsias, Berberidopsis, Azara and other somewhat tender shrubs are used in the same way. But I cannot recommend the use of shrubs as wall-vines in America. Among woody vines the following are hardy and good:—

ROSES.—The Prairie Roses are the best; they are very hardy, copious, and come into blossom when other roses are mostly past. The Ayrshires are rampant growers and flourish on poor soil, and the Climbing Hybrid Perpetuals are well fitted for training to pillars or against walls, and have as large, double and beautiful flowers as their dwarfed namesakes.

CLEMATISES.—Free-growing, copious, showy and most of them hardy. Our woods teem with white-flowering ones. C. graveolens, from Thibet, is yellow; C. coccinea, from Texas, glowing scarlet; and among our garden varieties are many shades of white, blue and purple, also single and double flowers. The "patens" type blooms in the Spring; the "florida" and "lanuginosa" in the Summer, and the "viticella" and "Jaekmanni" in the Summer and Fall.

CHINESE WISTARIAS.—Showy and much admired, and useful anywhere where a long-reaching vine is needed. The white-flowering variety is less appreciated than the blue.

GOLDEN BELL (Forsythia).—Bears a profusion of yellow blossoms in Spring before the leaves appear; a rapid grower; does well in sunny places, and is fitted for door-posts, pillars or trellises.

HONEYSUCKLES.—Special favorites. Some have yellow, others red flowers; some are fragrant and a few evergreen; the golden-netted is prettily varicgated.

PIPE VINE.—An excellent shade or shelter; has a rank growth of massive leaves. In hot, dry places the leaves often get seared by red spider.

TRUMPET VINE.—Quick-growing, handsome on high pillars where its branches can hang out around it. Old plants bloom more freely than young ones.

AKEBIA.—Pretty for fences, pillars, porches, or strings against the wall; hardy, fast-growing, retains its deep-green leaves till nearly Christmas.

VIRGINIA CREEPER —Good for screenery or drapery; thrives in light or shade.

PERIPLOCA GRÆCA.—A pretty twiner from Southern Europe; old plants are hardy in the North, but young ones barely so.

CLIMBING WAX-WORK.—Its showy fruit in Fall claims for it a garden place. It likes a moist but sunny spot.

Herbaceous Vines,

as a rule, are hardy, rapid growers, and, although available as screens, are mostly grown for their ornamental drapery and pretty flowers. They are more lasting than annuals and of the easiest culture; good soil and a sunny position prolong their growth and multiply their blossoms.

CLIMBING HEMP-WEED—Delights in moist and partly shady places and to scramble over bushes; a fit companion to the Virgin's Bower; has flowing wreaths of whitish Eupatorium-like flowers.

GROUND-NUT—Grows where the Hemp-weed does; bears brownish-purple, violet-scented flowers in great profusion in late Summer and Autumn.

CHINESE YAM or CINNAMON VINE.—Quick and dense-growing, neat, handsome in leaf and fragrant in flower. Multiplies itself by axiliary tubers. Old tubers reach deep into the earth.

HOPS.—Ready growers, but often defaced by insect vermin.

BRACTED BIND-WEEDS—Calystegia.—Fast growers; will crawl or climb; have pretty flowers, but vile spreading roots. The Chinese double-flowering sort is a good and showy garden plant.

MAN-OF-THE-EARTH CREEPER.—A strong-growing Morning Glory, whose bulky roots reach very deeply into the ground.

THLADIANTHA.—A Chinese member of the Cucumber family; very hardy, fast-growing and profuse, bearing bell-shaped yellow blossoms all the Summer long. It has chain-like tubers like the Ground-nut; best naturalized in half-wild places.

EVERLASTING PEAS.—In open places and rich land, and trained to stakes or branchy pillars, these (white and purple) are among the choicest of garden flowers.

Annual Vines

are showy-flowering plants, and some of them are useful as a hasty covering. They need but little care beyond good feeding, lots of water in Summer to prolong their growing and blooming period, and strings, stakes or other means of support. Some of them, as maurandias, Cypress-vines and ornamental gourds, may be started in a hot-bed in Spring for earliness' sake, but all of them should prove satisfactory if sown out out-of-doors in April or early May.

CLIMBING FUMITORY.—Handsome in leaf and flower; a rapid grower; self-sows itself; annual or biennial.

QUAMOCLIT COCCINEA.—Like a Morning-Glory in leaf and Cypress-vine in flower; a good grower; a late bloomer.

NASTURTIUM.—Everybody's flowers.

CYPRESS-VINES.—Sown in little circular patches and trained up strings in sharp pyramidal fashion, they are great favorites.

CANARY VINES.—Pretty vines with many yellow blossoms; need a cool, moist place.

MAURANDIA BARCLAYANA.—Exceedingly profuse and free-growing; likes good feeding and an open, sunny exposure.

MORNING-GLORIES.—Common but pretty.

ORNAMENTAL GOURDS.—Rapid-growing and far-extending plants, whose chief ornamentation is their variously formed and colored fruits.

WILD BALSAM APPLE.—Free-growing; likes damp, rich ground and a sunny exposure; in late Summer bears a copious crop of bunches of little white flowers.

SWEET PEAS.—On moist, rich land they grow freely and bear great crops of lovely, fragrant flowers.

SCARLET RUNNERS.—Ornamental and useful.

Clinging Vines.

American houses, by means of any plant yet discovered, cannot be clothed in evergreen as are the ivied buildings of the Old World; but in Summer we can cover them with as bright a green and in Fall with as glowing a red as Europe's walls can show. The following vines, by means of rootlets all along their stems and branches, stick closely and tenaciously to walls of mason-work or wood:—

ENGLISH IVY.—Evergreen, hardy in cool, open, comparatively sunless situations, as on a north-facing wall.

AMPELOPSIS TRICUSPIDATA (Japan Creeper, like our Virginia Creeper).—Its thrifty growth, neat and compacted habit, profuse, bright and glowing leafage, tenacity to the wall, which it will thickly cover to a hight of 40 feet, and hardiness, have secured for it a place no known rival can usurp.

CLIMBING HYDRANGEA.—Its merits in America are yet untested, but it is quite hardy.

EUONYMUS RADICANS.—This and its variegated form are true evergreens, hardy, neat in growth, and fine for covering boulders in the rockery; or well cut-back plants of it make a pretty bordering. Some assert this euonymus is good for covering walls; our plants do not grow quick enough.

Barely Hardy Vines.

In the Southern States many vines can be enjoyed that will not survive our Northern Winters, uncathed, unless protected. Among them are Aranja albens, that in great profusion bears its white, rose-tinged blossoms all the Summer long; Passion-flowers of various hues of flower and fruit; Solanum jasminoides, of graceful habit and all Summer through abounding in clusters of white; Tea Roses, the glory of the Spring and Fall; Bignonia capreolata, evergreen and floriferous; jessamines of several sorts; the bold-leaved Stanntonia hexaphylla—almost hardy here; fancy ivies for the cool and shady nooks, and many other pretty things.

Other Vines.

Besides the above are many lesser vines—as Thunbergias—as great or greater; for instance, the sterile grape-vines. And were I to include the many tender vines that thrive far better when planted out-of-doors in Summer than when nursed in rooms or greenhouses, the list would be very much extended. Among these tender vines may be mentioned Passion-flowers, cobæa, mignonette vine, ipomæas, bignonias and dioscoræas.

THE RESOURCES OF OUR FORESTS.

PRES. E. GALE.

IN a new country, when urging home ornamentation and rural improvements generally, we are often met by the plea of want of means, or if not by that, at least by ignorance in regard to the varieties of trees, shrubs, creepers, and twiners, that will endure our climate. But these excuses reveal only ignorance of our own resources. We have in our own forests and along our own water-courses a variety of shrubs, creepers and twiners that can be obtained for the labor of collecting them, which, if properly planted, will make an attractive rural picture of any prairie home. Not only can those shrubs and vines be obtained in abundance without cost, but their hardiness is settled. It is difficult to repress the conviction that it is only from ignorance that men neglect our native flora for the costly and half-hardy exotics with which our grounds are often filled. Not that it is unwise to gather the beautiful productions of the entire temperate zone, but the pioneer planter will find it necessary to experiment cautiously in this direction. When we have made all we can of our native shrubs, vines creepers and twiners, we can safely go further.

We might begin with the Red-bud, that *avant-coureur* of the early Spring; and the Buckeye, with its delicate green, responding to almost the first Spring sun. Then we could go on to the Dogwood, Button-bush and Buckthorn, White Thorn, Prickly Ash, Alder, Red Osier, Black Willow, Elder and even Sumach, and, last to name here, the charming Wahoo, a beautiful plant always, but most attractive in Winter.

It may be no special compliment to the plant-

er that some of the following shrubs are imported under their botanical names and sold somewhat extensively, while our own forests abound with hardier varieties just as attractive. For bare walls, or the trunks of trees, or pillars, there is no more attractive plant than our own Virginia Creeper—Ampelopsis Virginiana. It needs no artificial training. It is, all things considered, the best vine for ornamenting houses in city or country, for it makes everything to which it clings picturesque. The native variety clings to all structures, while an imported variety needs much training and is quite inferior otherwise. [We presume Pres. Gale refers to Veitch's Ampelopsis.—EDS.] We can, if we will, find special attractions in the Trumpet Creeper, Bitter-sweet, or Staff-Tree, Greenbrier and Climbing Rose. To some more favored it may seem that we have a meager list; but still nature has given us enough for a good foundation, and when we have used these to the best effect we shall find in our native and hardy annuals a charming addition to our picture. To the pioneer planter, then, I would say—always select for your beginnings those trees and shrubs which nature has placed at your disposal.

Manhattan, Kansas.

THE FARMER'S LAWN.

A. B. ALLEN.

IF it were more generally known among farmers how cheaply a handsome lawn could be made and planted with beautiful trees and shrubs, and how easily it could be kept up after its formation, I am confident that few in our land would be found without this charming appendage in front of their houses. What is more cheering and lovely, as one rises in the morning and looks out of his chamber window, than to behold a choice variety of trees and shrubs scattered here and there over a moderate-sized grass plot, loaded with bright, sparkling flowers! What a pleasure also to all who pass by during the day to look upon it! However plain and humble a house may be, it never appears so when viewed fronted by a well planted lawn; and if I were obliged to choose between this and a much finer and more commodious house standing up staring and naked, without either trees or shrubs in its surroundings, I should infinitely prefer the former to the latter.

One may form quite a pretty lawn from a quarter of an acre of land; but a half or whole acre is still better, as a greater variety of fine trees can then be mingled with the shrubs.

I will now give a list of a few of the deciduous shrubs which I have found can be as easily planted and cared for as a blackberry or a currant bush. These are entirely hardy in the latitude of 40 to 41 degrees north; and most of them will endure the still longer and colder Winter two or three degrees higher, and, of course, flourish anywhere in a more southern latitude. For the benefit of any to whom these shrubs are unknown, I will name them in the order of their blooming, and the whole or a part may be planted according to the means or inclination of the farmer. Blossoming in

APRIL AND MAY, the forsythia comes first, usually about the 20th of April, with a rich yellow color. Then follow rapidly azaleas, Pyrus Japonica (Japan Quince), deutzia, weigela, hawthorn, snow-ball, flowering-currant and the spiræa. These vary in color from pure white or yellow, to pink and scarlet, while some show a mixture of all. Lilacs in addition to the common color, are also now found of a pure white. Wistarias are also of two colors, the one a pale purple; the other a pure white. They can be grown as climbers or as shrubs. A few of the above hold their blossoms into June, and occasionally, somewhat scattered, even into July.

JAPAN SNOW-BALL, (Viburnum plicatum).—FIG. 75.

JUNE—Tamarix displays a profusion of delicate pink blossoms. Honeysuckle, more generally a climber, is very fragrant, with a mixture of pale yellow, pink and white flowers. It continues in bloom into October; and the foliage usually remains green nearly all Winter, which makes it very desirable for ornamenting the pillars, and hanging beneath the roof of a veranda.

LEAVES OF THE GINGKO TREE, (Salisburia adiantifolia).—FIG. 76.

JULY—Syringa and the Japan Hydrangea produce white blossoms, the latter bearing a profusion of magnificent long trusses, very different from those of the small, common blue hydrangea. The Trumpet Creepers are bright orange, streaked with scarlet. They may be grown as shrubs or climbers. Of them the Tecoma radicans bears the greatest profusion of gorgeous blossoms I know. The petals are from three to four inches long, and of the same diameter at the top of the cup. One of these on my lawn, about five feet high with six feet spread of branches, showed for days in the hight of its season, from 350 to over 400

COMMON WHITE-FLOWERING HORSE-CHESTNUT.—One-fourth natural size.—Fig. 77.

flowers, completely covering the shrub. One may judge of the magnificent beauty and splendor of such a display! It continues blooming from the forepart of July to the middle of August, or for nearly six weeks, and a few flowers again appear in September.

AUGUST.—The althæas open their blossoms early this month, the different sorts varying in color from white to pink and purple, and a slight mixture of these. They continue blooming occasionally into October.

SEPTEMBER.—Now the hawthorn and the Euonymus atropurpurea, or Burning Bush, commence showing their scarlet berries, the head of the latter shrub, or small tree, forming a glowing mass of bright red, equivalent to so many flowers, for which at a short distance from the eye, each berry may be taken. The callicarpa is covered with bright purple, and the Virginia Creeper with dark-blue berries. All these continue into December, and if the Winter happens to be mild, during nearly the whole of that season. In addition to its berries, the foliage of the Virginia Creeper begins to assume a bright scarlet in September, and continues it late into October, thus making it equivalent to thousands of flowers. It is a beautiful climber for the pillars and along the edge of the roof of a veranda, hanging down in thick, graceful festoons, as low as may be desired. Another quality which greatly endears it to me is, that its berries are attractive to the lovely blue-birds, coming daily in flocks to feed on them, and repaying me with a sweet, plaintive song. The birds are then so tame I can almost lay my hand on them.

There are many deciduous shrubs which grow wild throughout our country, which may be transplanted to a lawn and be greatly improved there with proper cultivation. The farmer will do well to mark these as they blossom and, if then desirable, he can transplant them in the following Autumn or Spring.

SOME TREES AND SHRUBS

For Shelter, Shade and Ornament in Central Illinois.

B. F. JOHNSON.

I RATHER like that plan of the RURAL which devotes the main portions of a single issue to special subjects. Notified beforehand that these issues are to appear, the reader gives his mind to the subject, thinks, reads and observes in that line, and is prepared for something new or old facts represented in a new light. If he anticipates too much, he will be apt to be disappointed, but generally the sum of instruction received, and the gratification resulting, will put the measure of disappointment out of sight.

In recommending what I consider the best trees for planting in Illinois (and what is true of this section is equally true for the entire prairie section between, say 39° or 42° north, and from Ohio in the east to the Missouri River in the west and south), I shall confine myself to rather narrow limits and advise the planting of no tree which is not, in the first place, perfectly hardy and which has not one or more striking merits in its favor. Further, I shall leave the evergreens or the conifers (with the exception, perhaps, of one or two of the deciduous sorts) out of the account, because my experience with them has not been satisfactory, and because they are not indigenous to the country. Further, I shall advise the planting of no tree which I have not observed to possess a strong constitution and great vitality, which will enable it to withstand the changes and intensities both of heat and cold of the climate, and, moreover, every tree mentioned must have great powers of recovery from mutilation and accident. Last, but not least, all must submit as saplings to being transplanted from the forest, or as seedlings from the nursery.

For the hard-wood trees I set them down in the following order, ranking them in merit as they stand:

The Sugar Maple (Acer saccharinum); the Blue Ash (Fraxinus quadrangulata), first of all, and then the ashes in variety; the Black Walnut, and the Butternut (Juglans nigra and cinerea); the Honey Locust (Gleditschia triacanthos); the Osage Orange (Maclura aurantiaca; the Black Cherry (Prunus serotina). To which might be added two which seldom grow to large proportions, yet are larger than shrubs—the Red Bud (Cercis Canadensis); and the native crab-apple (Pyrus coronaria).

For the soft woods my list would include the the Lime or Basswood (Tilia Americana); the Cotton-wood (Populus monilifera); the Yellow Poplar (Liriodendron Tulipifera); the Black Willow (Salix nigra). To which I might add, under certain circumstances, the Pawpaw (Asimina triloba); the Persimmon (Diospyros Virginiana), and that evergreen conifer the Red Cedar (Juniperus Virginiana), and the two deciduous ones, the Bald or Swamp Cypress (Taxodium distichum), and the European Larch (Larix Europæa). With the exception of this latter and the Osage Orange, the above-named trees are all natives and to be found growing wild, though of the 81 indigenous forest trees of Illinois, 61 are common to the whole State, 14 to the southern part and six to the northern.

Perhaps no tree is better entitled to stand at the head of the list to be planted in Central Illinois, for shelter, shade and ornament, than the Sugar Maple, and, next to the Soft Maple, it has perhaps been more generally set out than any other. It can be said in its favor that it is readily and safely transplanted; quickly recovers from the shock of removal; grows fast; makes a broad and dense shade with its foliage in Summer, which turns to crimson and gold in the Autumn. It seems to regard with equal indifference the heat of Summer and the cold of Winter, heavy or limited rainfall, and grows vigorously on all soils, whether moist or dry, provided they are strong, loamy and deep. Besides, insects rather avoid it. Its timber is among the best for fuel and for many mechanical uses, and, finally, when it has achieved size and age enough, it becomes the sole reliable source for the production of sugar in these latitudes. The Sugar Maple is to be seen in its best form as a tree for shade, shelter and ornament in Jacksonville, Ill., and other early-settled towns. Nevertheless it is met with in almost every town and village in the State.

Of all the trees on my list, I know of none more worthy of being extensively planted than the Blue Ash. Indeed, if we leave the Black Walnut, the Burr Oak and the best of the hickories out of the account, the Blue Ash is the finest timber tree that grows on Western soil. Where the soil and the situation suit, it attains magnificent proportions and furnishes timber which has nearly every excellence—size, length, toughness, elasticity, hardness, weight, extraordinary strength, and durability almost without limit. No other handspike cut from timber saplings has the strength of the Blue Ash and no timber for axle-trees and other wagon and carriage work is superior to it. Besides, it is not uncommonly found growing in low lands and moist bottoms, where the young saplings develop a mass of fibrous roots near the surface, which make the transplanting easy and the after-growth sure. No young tree develops a sturdier or more shapely trunk, or forms a more regular head or throws out more vigorous limbs, and where some age has been attained, no tree has a more striking and picturesque habit. It bears seed keys in great abundance when 10 or 15 years old, which require to be planted immediately after maturity in September or October, in order to insure germination the succeeding Spring. I have given more space than I otherwise should to the Blue Ash, because, beyond its narrow native habitat, its many excellencies are so little known and understood.

The Black Walnut has such a splendid reputation, and its merits are so well known it requires but few words at my hands. It is transplanted not without difficulty. Beyond its claims as the most valuable of our timbers for elegant and costly purposes, when used as a fence post it outlasts everything but Red Cedar. Rebuilding a fence two years ago, which had been set through a low and moist prairie 24 years before, I found the walnut posts sound enough to be reset for a temporary fence; but the Burr and White Oaks were gone to the last one. In planting out the walnut, it should be placed where it will not be interfered with by the tramping of cattle, or where the soil will not be disturbed over its roots to any considerable extent, because it is impatient of such interference and has its growth thereby retarded, and if there is much of it, the tree will at 20 or 30 years die.

DUTCHMAN'S PIPE (Aristolochia Sipho).—One-sixth natural size.—FIG. 78.

As a mere shade tree the butternut is preferable to its half-brother, and its nuts are preferable, too; but its chief value is that its timber is in demand second only to that of its noble relative, the Black Walnut

THE
Rural New-Yorker,
PUBLISHED EVERY SATURDAY.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 Park Row, New York.

SATURDAY, FEB. 12, 1881.

The Rural New-Yorker begs to offer in articles of its own selection, for the longest and heaviest five heads of wheat from the next crop, $50.00, to be divided into first, second, third, fourth and fifth premiums. The awards will be published in our Special Wheat Number, and drawings presented of the prize heads.

Farmers, is there any valid, forcible reason why you should plant shrubs and trees about your homes; why you should, according to your means, seek in this way to render them as pleasant—as attractive as possible? If so, what are they? While reading this number of the Rural New-Yorker, we ask you to give this question due consideration.

The Mangel prize-takers will be announced next week.

It will be remembered that the next special Rural New-Yorker *will be devoted to* small fruits. *We hope to be able to present it in three or four weeks from this date. The next Special thereafter will be the* wheat number.

Our White Pine—Pinus Strobus—has the decided advantage over the popular Balsam Firs, viz., that whereas the latter are handsome in youth, growing ugly in age; the former is not handsome in youth but it improves as it grows older.

Why not plant an occasional dwarf fruit tree upon lawns among the ornamental trees? The Seckel upon the quince stock forms a shapely tree ten or twelve feet in hight. It is handsome in flower, handsome in fruit, is it not? The apple upon Paradise stock is also a handsome little tree. Are the flowers or fruit any objection that they should be excluded?

Among Hardy Vines, we should by no means forget the Golden Honeysuckle—Lonicera brachypoda aurea. This is really one of the finest of all variegated plants, as the golden coloring remains quite constant through the Summer. It may be used as a climber or grown to cover old stumps or to spread over the ground.

We commend the "Laurel-leaved" Willow to our friends as not only a handsome tree by itself, but as well fitted for wind-breaks or even hedges. It will stand a great degree of cold without injury (40° below zero, at least.) This willow does not sucker, and we are at a loss to know why it is not selected by nurserymen as a stock for the Rosmarinifolia and Kilmarnock.

Many farmers, in the kindness of their hearts, are full of anxiety for their stock, and the out-buildings are conspicuous for their neatness and order. No doubt the animals would thank them heartily had they reason and could they speak. Well, it would be well for such farmers to consider that their daughters, sons and wives *have* reason, and that they would in good time thank them if they would take the same pains to beautify the yards or inclosures about their homes.

For a permanent bedding plant, the clematis (in variety) may be used with great effect. Let the vines run as they will—only confining them to the space intended. For this purpose, the following kinds may be commended: Jackmanni, violet-purple; Lanuginosa, pale blue; Mrs. James Bateman, lavender; Veluntina purpurea, very dark mulberry; Sophia, pale blue; Henryi, white. For covering arbors, trellises, stumps, pillars, there are other hardy vines more desirable for their foliage, but none more desirable for their flowers.

We have never seen a hedge of the Ornamental Quince in bloom. If the plants constituting the hedge were of different varieties, bearing differently colored flowers—white, red, deep-red, chocolate, rose—they would present a rare sight when in full bloom. The Japan Quince is a beautiful shrub anyhow. Its leaves are glossy and of firm texture, its flowers—borne, too, in abundance,—are bright and of a peculiar softness rarely seen in other flowers. For groups, for single specimens, for hedges, this hardy shrub has few superiors.

We like Yucca filamentosa—Adam's Needle or Bear's-Grass—because it is different from other forms of hardy vegetation; because its leaves are evergreen; because in July it bears hundreds of white, lily-like flowers; because it will grow in almost any situation or soil; because it is hardy and easily propagated from seeds or divisions of the root-stocks. It is pretty alone, or with other plants of any kind. It will grow in moist situations, as along lake-banks, or it will thrive in light, sandy soil. Every garden should have this yucca.

People are very apt to judge too early of the shrubs or trees they purchase—when they first bloom, for instance. Usually then they are somewhat disappointed and ready to exclaim, "It is not so fine, after all!" But they should wait a few seasons. Most shrubs and trees, if attended to, continue to improve through several years. To this there are a few exceptions. The Great-panicled Hydrangea, so much praised in this number, is one. It is never prettier than during its *first* season, if growing in a soil not too hot or sandy.

The seed of many ornamental and useful trees ripen in Spring, and if once planted will produce young trees by Fall, that will safely pass the Winter. The Scarlet Maple, for instance, ripens its seed in late May. If planted at once, they would grow to a hight of at least eighteen inches by Fall. A Silver Maple will grow in four years from seed large enough to make considerable shade. Such seedlings may be raised by anybody, or bought of the nurseryman for two dollars per thousand. Still, thousands of well-to-do farmers have no trees either for shade, ornament or shelter! May we not hope that this number of the Rural may set such people to thinking?

The Rural's advice as to evergreen trees is to transplant in the Spring as soon as the frost is out of the ground, and no fear is entertained of a return of exceeding cold weather. If we could be assured of a wet Spring and early Summer, probably later planting would answer as well. It is very plain that as soon as buds start, the plant must receive a supply of sap from the roots to make good the loss by evaporation from the new growth of leaves; otherwise a loss of vigor must be sustained. The earlier trees and shrubs—be they deciduous or evergreen—are planted, the better they will be prepared to support the new growth and thus fortify themselves against early droughts.

The roots of shrubs and trees dug up from the woods or fields, should be carefully covered to shield them from the sun and wind while they are being carried home, and, indeed, until planted. They should also be severely cut back. The only reason why nursery trees are more safely transplanted than those from the fields and forests, is that a more abundant root growth has been secured by transplanting. The old, long, woody roots are cut away and a more compact growth of fibrous roots is induced.

A tree in the woods is supported by long tap or surface roots, extending far away from the stem. These, in transplanting, must be sacrificed. The inequality, then, between what remains and the stem and branches is great. The latter must be cut back to create a new equilibrium. Unless so treated, most forest trees will fail after removal.

We trust that many of our lady readers may be induced to practice grafting from a study of the article on page 107, which, with original engravings, gives every needed instruction upon the subject. Let them graft the lilac upon the privet—different colored lilacs upon the same bush; different colored Japan Quinces upon the same bush; the pear upon the quince, making dwarf pears. In Summer they may practice budding, which is merely a form or variety—so to speak—of grafting. The bud is simply a little cion *planted* between the bark and the wood.

Try grafting first, lady friends. Should you succeed, as no doubt you will if you learn your lesson well before you attempt to recite it, tell us if you do not take pleasure, if not a little pride, in pointing out your success to your parents and friends.

SOIL FOR TRANSPLANTED SHRUBS AND TREES.

When, eight years ago, we planted the Rural Grounds, holes from two to five feet in diameter were dug for trees and shrubs, according to their size, and they were filled in with muck—fresh-water muck—taken from low-lying, springy grounds which were afterwards converted into a lake. The thrift of all of our hardy plants is the remark of all who visit the place. Azaleas, rhododendrons, vines of all kinds, roses, herbaceous plants, shrubs and trees of all kinds have grown equally well in this soil, and we therefore commend its use to all. The use of manure, even though well rotted, about the roots of plants, is not, we think, advisable. We should not treat a plant during the first season after its removal to stimulating food. It is checked and weakened by removal and needs a plain diet.

THE SECRET.

The vigor of the many hardy plants at the Rural Grounds has led many a visitor to ask, "How do you do it?" The answer is easily given. For every plant an ample hole was dug. *Muck*, accumulated from a low, springy valley, which was converted into a pretty little lake, as stated above, was used to fill in. Circles about them ranging from two to three feet in diameter, according to the size of the tree or shrub, are kept free from weeds and raked often enough to preserve the surface smooth and mellow. These circles about the plants have been enriched with stable manure and slight dressings of of raw ground bone twice during seven years. This is the entire secret of our success with hundreds of different genera of shrubs and trees. Evergreens are treated in the same manner. For the latter we have always chosen early Spring as the best period of the year for transplanting.

CATALOGUES.

We would respectfully urge it upon our readers that they send for the catalogues announced in this and future numbers of the Rural New-Yorker. They are in fact epitomes of all useful information appertaining to the farm, garden and ornamental grounds. Besides the lists of well-known kinds of seeds and plants, as well as those of recent introduction from all parts of the world, concise directions for the cultivation of vegetables and flowers; for making hot-beds and cold-frames; for sowing all kinds of seeds, with an immense amount of condensed valuable information, are so presented as to render them of great value to those who really wish to learn and to make the most of their time and labor. Before the opening of Spring and the beginning of farm, garden or nursery work, most of our readers may find ample opportunity to study these catalogues, and, by careful comparisons, to determine not only what kinds it is best to purchase, but where to purchase them. If, indeed, no purchases are to be made, the catalogues may at least serve to awaken thought and interest, and to assist the judgment in a more judicious selection of seeds or plants for another year.

CUTTING BACK EVERGREENS.

But a few years ago it was considered the ruin of an evergreen tree to cut off its leader. If by accident it was broken, the symmetry of that tree was thought to have departed forever. How things change! The beauty of many evergreens in their maturity *depends* upon cutting back the terminal shoots or pinching out the terminal buds. Many of our readers—possibly all of them—may be ignorant of the fact that the White Pine (Pinus Strobus), if treated in this manner from the time it is four feet high until it reaches a hight of ten feet, becomes a tree of great beauty, symmetry and compactness. The firs, hemlocks, spruces, retinosporas, arbor-vitæs, are all greatly improved by being persistently cut back while young, and, notably in the case of the Balsam Fir and Norway Spruce, their lower branches are preserved many years longer than when the tree is permitted to grow at will. Our Red Cedar, as it grows in the fields, soon loses its lower branches and with them its beauty. Cutting back changes its nature. It becomes more dwarf, but more spreading and compact, and in this way is made a tree well worthy of a place in ornamental grounds.

THE LAWN.

"In a fine garden the first thing that should present itself to the sight should be an open lawn of grass, which in size should be proportionate to the garden. The width of it should be considerably more than the front of the house." So wrote an English gardener 130 years ago, says the London Garden, and so, since then, have thought and think the greatest of landscape gardeners. "Few scenes," wrote Loudon, "have a more beautiful effect in pleasure grounds than a velvet lawn, presenting a surface of uniform smoothness and verdure." In his excellent instructions "How to lay out a Garden," Mr. Kemp writes, "A Garden will always look meager without a good open lawn. One broad glade of grass should, therefore, stretch from the best windows of the house to within a short distance of the boundary, with as little interruption from walks as possible. The plants and groups may be arranged irregularly on either side of this opening, and where the space will permit there may be smaller glades through and among those at varied intervals."

Mr. Scott considers that a smooth, closely shaven surface of grass is by far the most essential element of beauty on the grounds of the suburban or country home. Dwellings, all the rooms of which may be filled with elegant furniture, but with rough, uncarpeted floors, are no more incongruous, or in ruder taste than shrubs and trees mingled in confusion with tall grass and weeds.

BREVITIES.

Catalogues of several of our most prominent nurserymen are not yet ready for announcement.

A Handsome Group.—The Golden Ninebark, the Purple Hazel and the Golden Elder together.

To meet with success in transplanting the Tulip tree from the woods, plant the *roots* only leaving but an inch or so of stem.

We beg to remark that those who need information as to catalogues—where to purchase etc.—will find it in our advertising columns of this issue.

The young shoots of the Buttonwood Tree (Platanus occidentalis) are very hard and are good for fagots. This tree is easily grown from cuttings.

Probably there is no better mixture of seeds for a lawn than Red-top and White Clover, in the proportion of three of the former to one of the latter.

It may be well to remember that such shrubs as kalmias, hollies, box and our native rhododendrons will do well under the shade of other plants.

Do not prune in the Fall or Spring such hardy plants as lilacs, magnolias, azaleas, etc., because the flowers are borne on wood of the previous year's growth. The time to prune them is just *after* they bloom.

If you want your ornamental trees to grow luxuriantly, dig for them large holes and fill in with rich earth. Then keep about the trunk a circle from three to five feet in diameter free of grass and weeds and the soil mellow.

A friend of ours has a hedge of considerable length of different-colored altheas (Rose of Sharon—Hibiscus Syriacus) on one side of his lawn, and we know nothing more attractive or more to be admired in landscape gardening, in our northern climate, than this beautiful "old-fashioned" shrub.

Forget not the beautiful hardy herb, Bleeding Heart. In early Spring, nothing is finer than its bold mass of light-green leaves and its long racemes of curious white and rose flowers. Botanically it is called Dicentra spectabilis. It is easily forced into bloom in the Winter. This is a native of North China, while Dicentra eximia is a native of the Alleghany Mountains. The latter does not grow so tall as the first, but its leaves are as graceful as those of a fern and it blooms during the entire Summer.

The Paulownia Confined to one Shoot.—Several years ago a strong root of the Paulownia imperialis was planted in the Rural Grounds, in the center of a flower bed about 12 feet in diameter. One shoot alone was permitted to grow. It made a growth of eight feet the first Summer, which was cut back nearly to the ground. The next Spring (1877) the stump budded May 24. As before, all the buds but one were rubbed off. On June 1st this bud had grown one foot. Afterwards, to ascertain its rate of growth, it was measured on August 5th, and again on August 12th. The growth was precisely 13 inches. September 23, the stem had attained a hight of 14 feet. The stem one foot from the ground was three inches in circumference. The leaves were about nine inches apart and the largest measured two feet three inches across. All of the leaves were nearly as large, except those at or near the top. They are heart-shaped—nearly round. The leaf-stalks averaged 16 inches in length and nearly an inch in diameter, remaining until frost quite green. The leaves stood many hard winds without being much torn. It towered up during the middle and later part of the season above the surrounding foliage—a singularly attractive object. The annual shoot has since been cut back every Spring, though it has not since in any season made so tall a growth as in 1877.

SOME TREES AND SHRUBS.

[Continued from page 103.]

The chief merits of the Honey Locust are that it is perfectly hardy, rapidly recovers from injuries and accidents of every kind, is readily propagated from its seeds, will serve as a hedge plant where the Osage Orange fails, makes lasting fence posts, is prodigal of honey at the time of blossoming, and affords a broad-spreading, thin shade and a very attractive adornment. It is not well suited to street planting, but it is admirable standing apart on lawns, or on low-land pastures there sheltering from the sun's rays in the Summer time.

The Osage Orange, introduced less than half a century ago, by the venerable Professor Turner, of Jacksonville, for the sole purpose of a hedge plant, has not only served that purpose in almost every respect, but has developed so many excellencies that its introduction must be considered a benefaction to the prairie country. It is as easily grown from seed as Indian corn; transplants when small or large, almost as readily as the willow; makes an impervious hedge when small and kept trimmed; is the best of all wind-breaks when suffered to grow large; produces fruit, containing seed which germinates better than that procured from the trees; furnishes the most lasting of all vine stakes when small, and when large the most durable fence posts as well as the handsomest of timber of a color between lemon and orange. Besides, its leaves are only second to those of the Red and White Mulberries for the feeding of silk-worms, and when planted apart it makes a round-headed tree resembling considerably in form, foliage and fruit, the Sour Orange of the South. Its habitat is in Arkansas.

The Red-Bud and the native crab apple, if tap-rooted and somewhat difficult to transplant, nevertheless quickly recover and grow into shapely small trees which are attractive late in the season; but early in it, are so surprisingly beautiful, charming and fragrant with their red buds at first, and with their masses of bloom thereafter, that any and every lawn and garden which does not possess them may be set down as deficient in adornment.

First in the order of soft wooded trees comes the Lime or Basswood. The chief and striking merits of this tree are its hardiness; the ease with which it is transplanted and made to grow afterwards; its indifference to the tramping of cattle; the rapidity of its growth; and, perhaps, best of all, its two or three weeks of abundant bloom, which, occurring immediately after the first flowering of white clover, furnishes bee-food and honey of nearly equal excellence to that from the latter. When taken from the timber or from the nursery, it is apt to have a straggling and unshapely form, which it retains for some years; but if a little attention is given early to pruning and shaping, it rounds up into tolerably regular proportions. It is readily propagated from seeds sown as soon as ripe in August or September, the plantlets appearing the following Spring.

The Cotton-wood is recommended on account of its extraordinary vitality and rapid growth even under the most discouraging circumstances. The formerly bare prairies of Illinois are dotted over with volunteer Cotton-woods. They were the first to lead off in the partial wooding of the prairie country, which has taken place within the last quarter of a century—an improvement which, if it goes on as it has begun, will transform that formerly treeless region into something that will resemble a tolerably well wooded country. Like the Lime, the Cotton-wood is wholly indifferent to the tramping of cattle, and I know of specimens standing on commons, under which cattle have congregated in the heat of the day for the last fifteen years, which have reached something like great dimensions. The Cotton-wood should be planted in pastures and meadows, wherever shade and shelter are needed for cattle. The trees may be readily propagated by large or small slips or cuttings; or limbs of one or two inches in diameter and convenient length, buried a few inches deep in rich, moist earth, will be sure to grow.

Were it not for the rare beauty and florid grandeur of the Yellow Poplar (Tulip) when it has attained full growth and is covered with blossoms; and were it not that it is the nearest Northern relation of the Magnolia grandiflora, the most magnificently beautiful of all flowering trees; and were it not, when in a state of health, the cleanest and nicest-appearing of all young saplings, I should hesitate about advising its planting, because, though grown from seeds after the manner of the Lime, the saplings require to be very carefully root-pruned, one or two years before transplanting, and even then, where the work is done with great care and the mass of soft fibrous roots very gingerly handled success is often a matter of doubt, unless after planting there occur several weeks of warm and moist weather.

The Black or common, indigenous Willow, is just the thing for continuing fences across sloughs and wet places where the Osage Orange refuses to thrive. It may be made to attain large growth by cutting off from well grown trees limbs from three to four inches in diameter and six or seven feet long, and setting them in moist places in course of the late Fall, or early Spring season. The willow throws out a multitude of surface roots which wholly occupy the ground as far as its limbs extend, and these, in connection with the abundant foliage of the top, assist in drawing off the surplus water, and in course of a few years make the wettest land dry.

THE COUNTRY HOME THAT KEEPS THE BOYS ON THE FARM.—FIG. 79.

The Pawpaw and the Persimmon may be dismissed in a few words. They are both very difficult to transplant, whether as saplings from the timber or as seedlings from the nursery, and in neither case is the work practicable unless they are carefully root-pruned the previous year. But they are wild fruits, common to the country, and as such are greatly underrated, and therefore they invite the attention of all lovers and propagators of native trees. Besides, both are no doubt capable of being greatly improved, and the same measure of improvement can be made upon them that has rewarded those who have made efforts in the same line with the native strawberry, blackberry and crab apple.

Of the evergreen conifers, the Red Cedar, it may be said that it is really our sole indigenous evergreen tree; that it is astonishingly hardy, and will flourish in almost all soils; that it makes the best of hedges of the kind, and is the most durable of all timbers we have, and when of sufficient size it brings a larger price for ornamental purposes and cabinet-work than any timber we have.

The larch is surprisingly hardy, as well as a fast-growing tree, and, next to the Red Cedar, it is the conifer which resists all the inclemencies of a climate whose changes are intense in Summer and Winter both.

As for the Bald Cypress, it may be grown as an illustration of how a tree which in its native habitat is rarely found except in swamps, and which is the only one that will flourish with its entire root system under water, will, when transplanted to high and dry land and left standing apart by itself, develop into a cone of foliage as large and well-formed as the largest and handsomest hemlocks. And in so doing it affords a good example of the truth that many trees affect or grow only in low and wet situations, because there only are to be found those permanent conditions of moisture and temperature which are essential to the the germination of their seed and the early growth of the young plants.

SHRUBS FOR COLOR.

E. P. POWELL.

It is desirable to have our shrubs so selected and arranged as to make our lawns bright with color, especially early in Spring and late in Autumn. The following list will be of use in that direction.

1. Red Dogwood.—This is deep blood-red in April and again in November—[? Eds]. If given a moist spot, it will spread over a large space, making a dense mass of shoots rising from five to ten feet. It may also be grown as a small tree ten feet high. In either case it is invaluable for rich warmth of color.

2. Mahonia is a rich glossy evergreen shrub that gives fine golden blossoms, but it is especially notable for the rich colors of its young growth, these being mottled crimson, gold and green. It is one of the finest of all shrubs. It needs to be sheltered from wintry suns and from drying west winds. Give it a northeast angle of the house.

3. Forsythia viridissima.—This is handsome when in bloom in April; but its special value is in giving rich purple foliage in Autumn. It resembles in color the autumnal hues of the White Ash; and these two are the only trees or shrubs giving a good purple.

4. Purple Barberry, a hardy and exceedingly handsome shrub, giving a crimson-purple all Summer. There is nothing finer, but it has a rival in the

5. Purple Filbert, a shrub that grows about as large as a hazel bush. It does not retain its depth of color all Summer, but is charming in Early Spring and late Autumn.

6. Spiræa prunifolia.—This is not only one of the loveliest shrubs while in blossom in May; but it is even more beautiful late in Autumn, with its exceedingly unique shades of crimson and scarlet.

7. Euonymus.—The American variety, with blood-red fruit or seeds, and the European with roseate fruit, are both fine, the American being the better. During November, these shrubs fairly blaze with brightness when all else is dull. They may be planted in profusion without detriment to the finest lawns. Branches picked as soon as the buds burst their pods will keep fine all Winter for home decoration. Now, add for variegated-leaved shrubs the Variegated Althæa, very fine; the Variegated Weigela, dwarf and excellent; the Variegated Elder, handsome and hardy; the Variegated Dogwood, quite clear and pretty, and the lovely Cissus for a vine, and you get an exceedingly choice addition to your lawn. The Golden Yew and the Golden Arbor-vitæ are hardy and make two evergreens all should have. The yew may need slight protection.

NUT TREES AT KIRBY HOMESTEAD.

COL. F. D. CURTIS.

I always loved trees and as soon as I was big enough I began to transplant them. Our entire road-side is lined with maples, and every spot and corner in the grounds has its tree. Our life insurance is a pear orchard; and the rocky and abrupt side-hills are utilized and ornamented with groves of locusts. When the babies were born, we thought of nut trees for them. A modest little grove was planted at first, but we did not stop with this, for our thoughts went on to the future when there might be profit as well as pleasure to them in nut trees. We found a very early and large variety of chestnuts which we obtained and planted, and now we have an incipient chestnut grove. Butternuts and Black-walnuts are almost ready to bear, numbered by scores.

The nuts were planted among the rocks where the soil was so scanty that the seed-beds were dug up with a pick. These trees, which really cost nothing, we prize highly. We have all the indigenous nut trees growing, having been raised from seed dug in between the rocks or steep places. Not satisfied with these, three varieties of hazel-nuts have been planted, two of which are bearing; we have also some Spanish Chestnuts some of which blossomed last year. These, although growing in this strange latitude, 43° north, have never died down in Winter, as we feared they would. An English Walnut has been growing for four years without freezing since it was planted in a protected spot, and we have allowed it to grow up stocky with the branches near the ground. Seed of these, our favorite nuts, were obtained from Newark, N. J., where we found them growing. These were planted at different points so as to secure a favorable location where they might do well. They came up and have grown nicely so that we are looking forward with ardent expectations of soon gathering a crop of these delicious nuts.

We do not know of any of these trees nearer than a farm of Hon. Waldo Hutchins, Westchester Co., N. Y. We have succeeded best in starting our different varieties of nut trees by putting the nuts, as soon gathered, in the ground where we wanted them to grow. The only difficulty we have experienced has been from the depredations of mice and squirrels. To avoid this trouble we have sometimes spread the nuts, when gathered, in grass near the house and covered them slightly with coarse manure or leaves and then planted them in the Spring before they started to grow.

Growing nut trees is so easily done that we wonder they are not more generally cultivated. They would help to make the farm attractive as well as profitable, and give to the children an interest in the homestead, which is so often lacking in American families. We are glad to see that the Rural devotes so much space to home adornments and the growing of trees. It is a most commendable work which all parents should heartily encourage.

RURAL BRIEFLETS.

The Belgian Monthly Honeysuckle—Lonicera Periclymenum Belgicum—is one of our oldest honeysuckles, always prized for its clusters of fragrant flowers. It blooms all Summer, the buds being red, the flowers white at first, changing to orange. Its foliage is not so pretty as that of Hall's Japan Honeysuckle, and is more liable to the attacks of the aphis.

Tecoma radicans is our well-known, useful and beautiful Trumpet Creeper, with its large, heavy, home-like, orange, trumpet-shaped flowers. If but to insure the frequent visits of the humming-bird, we should have this. It begins to bloom in July, and its canoe-shaped fruit or "beans," in clusters of three or more, hang on the vines all Winter. This is a native of the Middle and Southern States. . . . .

Dutchman's Pipe—Aristolochia Sipho—is a noble vine, with immense heart-shaped leaves, which so thickly cover the pliant, rubber-like stems as to remind one of the shingles on the roof. Its flowers are simply queer. We value the vine chiefly for its giant leaves, which enable it in a few years to entirely conceal any object over which it grows. It is perfectly hardy, and when once established needs very little care. In company with other hardy vines, such as clematis, Akebia, Trumpet-Creeper, Moonseed, etc., the leathery leaves of the Dutchman's Pipe, from seven to twelve inches in diameter, stand out in bold and beautiful relief. Our picture is re-engraved from the work of Decaisne & Naudin. A life-size engraving of the flowers appeared in the Rural of Aug. 30, 1879. . . . . .

In late May or early June the little evergreen shrub, Daphne Cneorum, is covered with clusters of pretty pink flowers. This is a native of the Alps of Europe, and is the best of the daphnes for out-door cultivation. It is easily propagated by layers in the open ground or cuttings under glass. The plants usually bloom in the Fall again, and occasionally during the Summer. . . . . .

For five or six years we have had one plant of the Dwarf June-berry, Shad-bush or Service-berry, a variety of the Amelanchier Canadensis, viz, alnifolia. In its bloom it is fully as pretty as many of the spiræas, while in fruit it is an object of general interest, as well to grown people as to children and birds. It bears racemes of fruit nearly as large as gooseberries, and in the same raceme the color varies from green to green and purple, red, and a deep plum-color, according to the stage of ripening. The first ripen about June 1st, and the berries continue to ripen during a greater part of the month. These berries are mealy and juicy, though rather insipid. Still—we eat them. The Shad-bush must be known to most of our readers, who can scarcely fail to have noticed its welcome white flowers during late April and early May along streams and low-lying woods. It varies so much that half a dozen different varieties are recognized. Among them is the Dwarf June-berry, of which we write. It is found in all of the Western States. . . . . .

Seeds of such evergreen trees as the Hemlock Spruce, Norway Spruce, Black Spruce, Balsam Fir, Silver Fir, White Pine, Scotch Pine, Arbor-vitæ, etc., may be sown in the Spring in beds or boxes of mellow or sandy loam. They should be covered lightly, kept moist and shady. . . . . .

The seeds of the Norway Maple may be sown in the Fall as they ripen. Unless buried in sand or soil during Winter, they would, if not planted until the next Spring, be slow to germinate. The sycamore, Red or Swamp Maple, Sugar Maple, beech, ash, locust, Kentucky Coffee-tree, halesia, hibiscus, philadelphus, weigela, deutzia are all easily raised from seeds. Unless the seed matures early enough to give them a good start during the Summer and Fall, it is better to keep the seeds over Winter in sand sufficiently moist to keep them from drying out. Magnolia seeds, for example, will often germinate in two weeks if planted just as soon as they ripen. If permitted to dry, they may not germinate in years, or at all. The grape gives a good illustration of this. . . . . .

The birch is easily transplanted from the woods. Even sizable trees may be removed successfully. Seeds may be sown in the Fall and covered with leaves. . . . . .

The seedling cultivation of trees and shrubs ought to be familiar to every farmer and to his children. Many seem ignorant of the fact that some of our best shrubs and trees are easily raised from seeds. We may add to those already mentioned the Fringe Tree, Elæagnus, Kœlreuteria, dogwoods, Sassafras, Liquid-ambar, horse-chestnuts, catalpa and Red-bud.

Horse-chestnuts should be gathered as they fall and placed in boxes of sand for the Winter. In Spring they may be planted in drills of well

prepared soil, six inches apart, covering them fairly. They may be transplanted in the Fall to two feet apart, and there left to be used as wanted. . . . . .

PROFESSOR THOMAS MEEHAN says:—

"Nothing is more remarkable, when you come to consider, than the way one plant can can be grafted with another, and yet retain its individuality. Take a grape-vine that bears black fruit, and two feet above the bud, graft with white; and two feet above the white bud graft with a black variety, and then with a white, and keep on grafting as high as you choose, yet each one continues on bearing its kind, without any change."

But, in fact, is this any more strange than that, growing in the same soil, different trees should bear different stems, leaves, flowers and fruit? Is it any more strange than that, growing in the same flower-pot, the Deadly Nightshade is poisonous—the tomato good to eat? . . . .

MR MEEHAN truly remarks, in his Handbook of Ornamental Trees, that a little extra expense in the selection of trees, a little extra thought in giving to each its appropriate soil, and a little care bestowed upon their removal and replanting, will be amply repaid in the future beauty, variety, health and luxuriousness of shade trees. The saving of a dollar in a gratification which is expected to last for life is a consideration which will have little weight when duly reflected on. . . . . .

THE chief reason why trees from nurseries transplant better than those from the fields or woods is that the former have more fibrous roots near the stem from having been previously transplanted or root-pruned. The roots of forest trees extend in every direction, and it is impracticable in removing them not to leave the greater part in the ground. To meet with success, either they must be removed while very young, or the stems must be severely cut back. But even in the latter case there must be a certain amount of small or fibrous roots, or else the tree amounts to pretty much the same thing as a mere cutting. . . . . .

As a rule, large trees, if ever so carefully transplanted, grow with far less vigor than small ones. . . . . .

IS IT not strange that one of the most beautiful trees of America is so seldom seen about the farmer's home?—the Liquidambar. It is referred to under Notes from the Rural Grounds. The following is what Mr. A. J. Downing said of it:—

"We hardly know of a more beautiful tree than the Liquidambar in every stage of its growth, and during every season of the year. Its outline is simply beautiful. During the Summer the leaves preserve unsoiled that dark, glossy freshness which is so delightful to the eye. But in Autumn it assumes its gayest livery, and is decked in colors almost too bright and vivid for foliage, forming one of the most brilliant objects in American scenery at that season of the year. The prevailing tint of the foliage is then a deep purplish red, unlike any symptom of decay. This is sometimes varied by a shade deeper or lighter and occasionally an orange tint is assumed. When planted in the neighborhood of our fine maples, ashes and other trees remarkable for their Autumn coloring, the effect is almost magical."

F. J. Scott adds one trait of its Autumn coloring, which Mr. Downing overlooks. It is its peculiar golden-bronze tone, caused by the mingling of green, yellow and red leaves in its head. Trees sometimes fairly glow with these rich colors. . . . . .

THE "Sunray" Pine is, we learn, being propagated as fast as possible. It is to be hoped it will soon be offered for sale. It seems to us the finest of variegated evergreens, and can scarcely fail to become popular. . . . . .

THE Silver-variegated Euonymus radicans is a unique little bush that holds itself together as closely as a mattress, by the stem rootlets, like those of the Virginia Creeper. Our specimen, which has never been pruned, has grown into the shape of a boot about three feet high.

THE Smoke Tree, Venetian Sumach, Wig Tree (Rhus Cotinus), as it is variously called, when grown in congenial soil (sandy loam, well drained), is one of the finest shrubs or small trees in cultivation, if judged while it is in bloom. In middle-May the buds usually break. The young leaves are tinted with purple and the flower-buds then resemble young racemes of grape flowers. The early inflorescence envelops the tree as in a fine spray of pale, delicate green, the leaves only breaking through here and there. Later (June 15) it begins to change to a soft, pleasing pink or deep flesh-color, when the entire shrub seems a cloud or mist of light-green and rose, each shading off into the other. It is then a grand sight, especially when the dew still rests upon the clouds of hairy pedicels before sunrise. . . .

AS OUR own specimens occasionally suffer during Winter, we were somewhat surprised to learn, through our valued contributor, Mrs. Jack, of Canada, that it there reaches a hight of eight or ten feet, flowering profusely. In her note she remarks:—"Year before last it bore a late crop of October flowers. Last year late-grown wood was injured for the first time; but it was an exceptional season." . . . .

WE have been greatly interested in the movement of the branches of the Weeping Beech. Years ago, as already noted in these columns, one of our two specimens lost its leader. The next year the branch immediately underneath, then growing directly downward, began to move upward. This branch is now the *upright* leader. Not less than three other branches, which then drooped almost directly downward, have since been moving upward, until now they have moved through from 15 to 30 degrees towards a perpendicular. Such movements are common enough where there is a disturbing cause while the wood is comparatively young; but the branches of this Weeping Beech seem to be wandering about as if they were not contented to remain in a fixed position. . . . . .

HERBACEOUS PÆONIES are showy and hardy. The columbines [aquilegias] are among our best hardy herbaceous plants. The larkspurs [delphinium] should not be forgotten. Their colors—especially the blue—are scarcely equaled by any others of this class. The Dicentra spectabilis should be found in *every* garden. This is the well-known Bleeding Heart. . . . . .

AMPELOPSIS QUINQUEFOLIA is our Virginia Creeper, Woodbine, or American Ivy, as it is often called. Sometimes, by means of its foot-like tendrils, it ascends trees to the hight of 50 feet. It is found wild nearly everywhere. It bears its little greenish flowers in June, and, later, its dark-blue berries. Nothing is better for arbors, walls, bridges, than this. . . . .

THERE is now a double white bouvardia, which is a handsome acquisition among house plants. . . . . .

ALL interference with roots had better be done in the Fall or early Spring. As soon as buds push, the roots are needed to do their share of the work in supplying the entire plant, through the leaves, with material for its growth.

WE think there is much truth in the following lines from a writer in the Garden:

"The farmer who has a neat and well-kept garden, is almost sure to have a neat and well-kept farm, a comfortable and well-appointed house, tidy outbuildings, and stock in good condition, and the housewife who takes pride in her garden, generally has a home to take pride in and to be proud of."

CUT cherry cions now—preserve them in sand in a cool cellar.

Transplanting.

For a tree or shrub—whether evergreen or deciduous—remember the following items in transplanting:—

1. Dig the holes wider and deeper than is necessary to admit the roots, so that they may rest in a natural position.
2. Cut off all dead or injured roots.
3. Firm the soil as it is thrown in, either with the feet or a wood pounder.
4. Do not set the tree deeper than it grew before transplanting.
5. Level the soil and keep it mellow during the Summer.
6. Cut the branches and stem, if need be, back in proportion as the roots have been injured. Whether they have been injured or not, it is advisable to cut the branches back more or less according to the size of the plant.
7. Carefully avoid exposing the roots to the wind or sun during trasplantation or at any other time. No other neglect is so prolific in causing failures as this.

Depth to Plant Trees.

The roots of trees must be accessible to air. It is as easy to kill a tree by burying the roots too deep as to smother an animal. The object of *compacting* the earth about the roots is to insure *contact* of the roots and soil—not to exclude air. Tap-roots which extend deeply into the earth have little to do with nourishing the tree. They serve chiefly to hold it securely in its place against high winds and the weight of the trunk, branches and foliage. Deep planting does not protect a tree against droughts. For this purpose a coarse mulch of manure, leaves, hay or straw or even stones, would best serve.

ANNOUNCEMENTS OF CATALOGUES FOR 1881 RECEIVED UP TO DATE.

The RURAL NEW-YORKER *begs to state that it will announce the Catalogues of all reputable seedsmen, nurserymen, etc., as they are received. Readers are referred to our advertising columns for particulars not stated under such announcements. It is plainly desirable on all accounts that our readers, in sending for such Catalogues, should mention the* RURAL NEW-YORKER. *This should insure due attention to their requests, while it seems an act of respectful appreciation of this journal. In future issues, we shall take pleasure in referring to specialties offered in the Catalogues received, respecting which our readers have made inquiry.*

JAMES M. THORBURN & Co., 15 John Street, New York. A catalogue of 96 pages. Seeds of all kinds for the vegetable and flower garden; for the lawn, farm and nursery. This trustworthy establishment *controls* the entire *sale* of the White Elephant Potato.

ALFRED BRIDGEMAN, 876 Broadway, N. Y. A catalogue of 50 pages, profusely illustrated with life-like, original engravings of plants. This good concern was established in 1824.

JAMES VICK, Rochester, N. Y. Vick's Floral Guide—120 pages. Among the beautiful illustrations are a colored plate of annuals and a finely executed portrait of Mr. Vick.

B. K. BLISS & SONS, 34 Barclay Street, N. Y. Illustrated Hand-Book for the Farm and Garden and Catalogue of Garden, Field and Flower Seeds—140 pages. Hundreds of fine illustrations among the many novelties and a beautifully executed colored plate of German Pansies.

J. T. LOVETT, Little Silver, New Jersey. Illustrated Catalogue of Trees and Plants. Choice Small Fruits a specialty. We like the originality and truthfulness of this catalogue. The illustrations are true to life, the comments trustworthy.

HIRAM SIBLEY Co., Rochester, N. Y., and Chicago, Ills. Catalogue for 1881 of Garden, Field and Flower Seeds, &c.—72 pages, finely illustrated with many engravings, including a colored plate of verbenas and a second of onions.

PETER HENDERSON & Co., 35 Courtlandt Street, N. Y. Catalogue of Everything for the Garden and Farm—120 pages, fully illustrated. Excellent hints and instructions; vegetables, rare plants, implements.

A. D. COWAN & Co., 114 Chambers Street, New York. A handsome catalogue, well illustrated, of 60 pages. Novelties in vegetable and flower seeds.

J. J. H. GREGORY, Marblehead, Mass. A comprehensive catalogue of 60 pages. Farm and garden seeds of all kinds, including many desirable novelties.

PARSONS & SONS Co., Flushing, Long Island, N. Y. Catalogue of Hardy Shrubs and Trees of all kinds.

R. H. ALLEN & Co., 189 and 191 Water Street, New York. Descriptive Catalogue of 80 pages of choice Farm, Garden and Flower Seeds, Roots, Plants and garden requisites.

ROBERT BUIST, JR., 922 and 924 Market Street, Philadelphia. Almanac and Garden Manual designed to furnish concise hints to cottagres, farmers and planters. Instructions for every month in the year—192 pages.

R. H. SHUMWAY, Rockford, Ills. Seed Catalogne—40 pages full of illustrations; a short lecture on planting.

BENSON, MAULE & Co., 223 Church Street, Philadelphia, Penn. Illustrated and Descriptive Catalogue of garden, field and flower seeds—60 pages—novelties and specialties.

THORBURN & CARSON, 125 Chambers Street, N. Y. A handsome, illustrated catalogue of 65 pages. Vegetable, flower and farm seeds, &c.

WILLIAM RENNIE, cor. Adelaide and Jarvis Streets, Toronto, Canada. Illustrated Catalogue of 80 pages. Seeds of all kinds. Mr. Rennie also issues a wheat circular.

TUISCO GREINER, Naples, New York. Catelogue of select, warranted vegetable and flower seeds—20 pages.

BAIRD & TUTTLE, Bloomington Nurseries, Bloomington, Ill. Plant novelties, Roses, Bulbs, greenhouse and bedding plants, etc.—40 pages. Also wholesale price-list of trees, shrubs, etc.

GEO. S. WALES, Bannockburn Farm, Rochester, N. Y. Catalogue (16 pages) of small fruits, shrubs, vines, roses, &c.

COLE & BROTHERS. Pella, Iowa. Catalogue and Guide (40 pages) to the Flower and Vegetable Garden.

W. ATLEE BURPEE & Co., 219 and 221 Church Street, Philadelphia. Farm Manual, garden, farm and flower seeds, blooded stock, illustrated.

ELLWANGER & BARRY, Rochester, N. Y. Catalogues of Shrubs, Trees, etc., as announced in advertisers' columns.

A WORD TO TREE PLANTERS.

WILL W. TRACY.

I WISH I could gain for a few moments the ear of every one who intends to set out a shade tree the coming season, and I know of no way in which I can come nearer to the realization of my wish than to say my say through the columns of the RURAL NEW-YORKER.

There is nothing in the vegetable world which has more individual character and expression than our native trees. Every one possesses a form and expression peculiarly its own, distinct from that assumed by any other even of the same species, and it is this wonderful variability which gives such an indescribable charm to the natural landscape—a charm which rarely exists to the same degree where the trees have been transplanted. I attribute this inferiority of transplanted trees largely to the method of pruning or cutting back at the time they are set out. For the most part, the trees that now ornament our village streets and country roads were hastily taken up from the neighboring fields and forests, and the greater portion of the top was cut off until what was a tree became a simple pole or stick with a few stubs projecting like the pegs of a hat tree—a resemblance which doubtless suggested the name for this useful article of furniture. They were then drawn, with exposed roots, to the desired point, where the roots were crowded into a hole, into which earth was shoveled, and straightway the men were ready to move on to the next. If the tree grew, it threw out a few leaves and shoots distributed irregularly and without form about the top, and the next season these grew vigorously into a dense ball of foliage little resembling the graceful spray of its brother left undisturbed in the fields, looking rather, as a "chemical" friend aptly said, like "gigantic green swabs," and furnishing good models for the trees of wire and green cotton that we find in our children's "Noah's arks." I admit that ultimately the tree outgrows its mutilation, but it takes long years to do it, and it rarely regains its individuality, so that transplanted trees of the same species are in a great measure counterparts one of another.

How immeasurably superior the result would be if trees were used which had been grown for the purpose rather than those from the fields, and if such care were taken that all this cutting back would be unnecessary. This is a subject, on which we need not dwell; for, if we insisted upon this, not one tree would be set where dozens are planted now, and we need all and more than all our people can be induced to plant. But the bad result for the first few years can be avoided, as I have found by experience, by a little attention to the cutting back—a work which seems to me so feasible that I want to urge it upon every tree planter in our land. If the tree selected has a central main stem or leader, cut this back to some small branch springing from it at as slight an angle as can be found, and so growing nearly erect. Cut this back to a similar branchlet growing from its upper side, and remove all other twigs or buds. If necessary, cut off all the lower-side branches close to the main stem; but, if any can be left, select those which are symmetrically disposed about the trunk and cut them back in the same way as the central one.

The simple rule is:—always remove a branch altogether or cut it back to a branchlet from it which has the same general direction and character, and remove all other branchlets or twigs. Even if the condition of the tree requires the pruning to be so severe that the branchlets left are very few and small, still, if they are well selected, it is astonishing to see how much they will do towards directing and molding the future development of the tree, and it will be a pleasing surprise to one who has been used to trees cut back in the usual way, to see how quickly a tree pruned on this plan will assume a graceful form. Evergreens should be cut back on the same principle. Usually there will be found growing from the upper side of the branches shoots having the same direction as the branch itself, and if we cut back to one of these the mutilation will scarcely be noticable even the first season.

I hope that every tree planter will try this method, which is not presented as something new; but as that practiced by experienced gardeners for ages; but which they frequently so obscure by "wise" talk and assumptions of special skill, that the ordinary planter fails to catch the principle involved, which I repeat for the sake of emphasizing it:—In all pruning of ornamental trees, cut off the branch entirely or cut it back to a branchlet which will most easily assume the general direction and character of that removed, treating this branchlet, if necessary, in the same way, and removing all others.

Detroit, Mich.

THE SHRUBS OF OUR EXPERIENCE.

ANNIE L. JACK, (CANADA.)

WHAT is the reason farmers do not surround their homes with hardy shrubs and trees suitable to the climate where they live? This question presents itself to every beauty-loving mind in passing through many parts of the country. Neither first cost nor subsequent care can be the reason, and we can only think that it is a matter that has never occupied thought or attention. Apart from the dear old-fashioned lilac that our grandmothers loved, and the snow-ball that gives us such masses of snowy blossoms in early Summer, there are others less known, that for thrift and hardiness deserve a place in our grounds. I find myself thinking of the Lonicera Tartarica, or Tartarian Honeysuckle, that from a little twig planted a few years ago has grown to an immense shrub ten feet in hight, which is covered in June with a profusion of pink blossoms. It seems to thrive in any soil or situation and never fails in its bouquet of beauty. We have several varieties of the spirea, which are hardy and easy to cultivate, with feather-like trusses of white or pink. I have tried the daphne and deutzia, but they need protection in this climate, although one of the latter, given me by the RURAL some years ago, does not fail to give me a few lovely bells in Spring.

The Flowering Currant is hardy here, as is the Snowberry and some kinds of clematis. The Syringa or Mock Orange, is a shrub hardy and of strong growth here. The flowers, of delicious perfume and great beauty, are most profuse in the time of roses. Later in the season we have the Rhus Cotinus or Smoke-Tree, that with graceful clusters of flowers in airy masses, reminds one of puffs of smoke emerging from the leaves. I have tried rhododendrons with small success; but find the Hydrangea paniculata grandiflora a valuable addition to our flowering shrubs. Its graceful and immense trusses are a thing of beauty in early Autumn when other shrubs are scarce. Just now we have been having an experience with the Mahonia or American Holly, the leaves and sprays of which adorned our rooms this Christmas-tide and vied with English Holly. This is, indeed, worth a trial, staying green and dark amid the snow. The Barberry is a satisfactory shrub; the yellow flowers in Spring are pretty and the red berries hang on the spray till Winter, and are very ornamental for house decoration, mixed with the leaves of the Mahonia. While there are many others that are worth a trial, I have only mentioned what we have proved and found satisfactory in our home.

GRAFTING.

THE question often arises, why is it that so few of our farmer friends understand the theory and practice of propagating fruit trees by grafting? As a general thing there are not more than one or two persons in any given community who make a practice of setting cions, and they are in great demand whenever any grafting or budding is to be done. The writer well remembers the kind old gentleman who, many years ago, was accustomed to make his annual visits at the farm, carrying in one hand a little basket, wherein were carefully laid the cions to be set, the wax, knives, twine, etc., while in the other were the indispensable saw, hatchet or chisel. Then we wondered why he was the only one who understood grafting when the process seemed to be so simple, and we wonder still that so few practice this useful art. We hope that the instructions we are about to give—though the story is a threadbare one to many of our readers—will encourage and enable many to "try their hand" at grafting.

Given all the necessary materials and utensils, the object is to make a cleft or slit in the end or side of the stock, and in this to fit one end of the cion so neatly that the bark of the cion may correspond with that of the stock. When this is properly done there need be no fear but that the sap of the old stock will rise into the cion and produce growth. The tools needed for grafting are few and simple. A light saw, a small and a large chisel, or, better still, a combined knife and chisel—as seen in Fig. 80—a mallet and a small knife, will enable one to do the mechanical work, while a supply of bast, or any soft, strong material, and wax will fill out the complement. A good recipe for making the wax is:—resin, three parts, bees-wax three parts, and tallow two parts. Grafting-wax in cakes may, however, be purchased of any seedsman. There are several different methods of grafting, but we shall here notice only those most commonly practiced and most likely to prove successful.

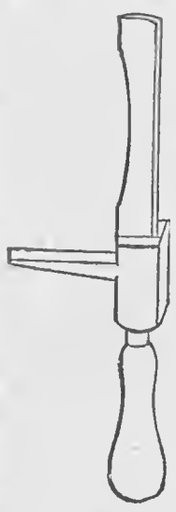


FIG. 80.

CLEFT-GRAFTING is illustrated at Fig. 81. This method is used generally on stocks of a diameter of from one to three inches. First saw off the stock, *b*; shave the end of it so that the point of union between the bark and wood may be readily seen. Drive the blade of the grafting knife, shown at Fig. 80, into the stock to split it then remove the knife and insert the wedge or chisel to keep the cleft open while the cions are being set. The cions should be previously made slightly wedge-shaped at one end, as shown at *a*, to fit neatly into the cleft, in order to secure a close union. In case the stock closes too tightly on the cions, a small wooden wedge should be inserted and left in the cleft. The wax may now be applied by filling all the crevices and covering the end of the stock with it. Care must be taken not to move the cions after they are properly set.

FIG. 81.

SPLICE-GRAFTING is the method by which small trees are often grafted, and is illustrated at Fig. 82. A cion bearing two or three buds, and about two inches long, is fitted to the stock. If care is taken to make the cuts true and the two parts are properly fitted, growth will almost surely follow. After the cion is bound to the stock by bast, yarn or something of the kind, wax must be applied so that no moisture can enter.

WHIP-TONGUE GRAFTING is illustrated at Fig. 83, where *a*, *b*, represent a stock prepared for the cion *o*. At *d*, they are united; at *e* the binding is applied, and at *f*, the wax is shown. This method is more difficult to carry into effect than those previously mentioned, as the joints must be fitted more exactly. In a few days after the cion has begun to grow draw a knife through the wax, cutting the ligature, otherwise growth will be obstructed.

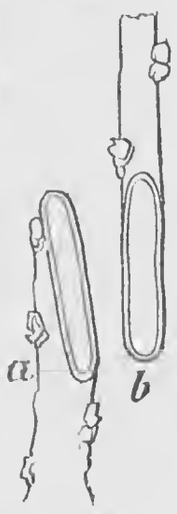

FIG. 82.

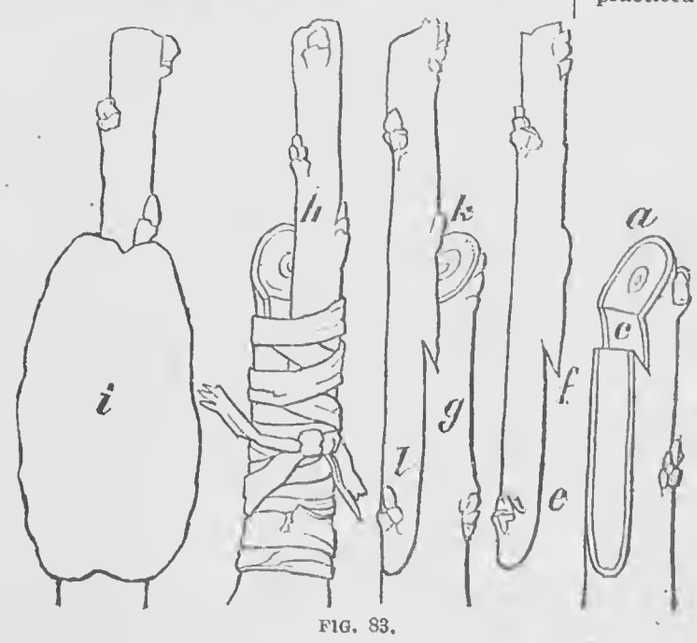

FIG. 83.

SADDLE-GRAFTING, Fig. 84, is but little practiced, yet it is a very effectual method. The accompanying cut will explain itself. This style of grafting requires no bandage, if the wax is carefully applied. Yet one may be used, as shown in the figure.

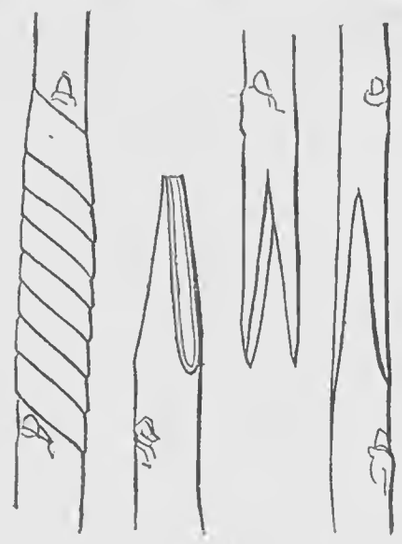

FIG. 84.

SIDE-GRAFTING is considered by many as superior to every other style, yet but few practice it. Where a cion is to be set on the side of a branch or small tree, make a slit in the stock as shown at Fig. 85, just as if a bud were to be inserted. Raise the bark on each side so as to admit the lower end of the cion. Crowd the cion into the slit as if inserting a bud, and be sure that the end of the cion fits neatly. Bind the parts together and put on a covering of wax. This is an excellent method to use in making a a tree symmetrical; in filling up with limbs any naked branch.

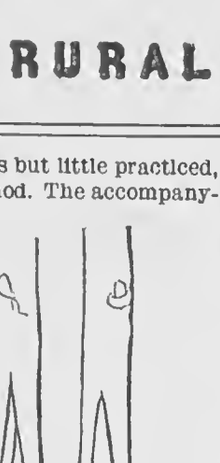

FIG. 85.

AMERICAN WHIP-TONGUE GRAFTING.—This method, which is similar to tongue-grafting as shown in Fig. 83, is more generally practiced among nurserymen. The cion and stock being first cut as for splice-grafting, the knife is passed upward in the cion *a*, Fig. 86, and downward in the stock *b*, forming a tongue which serves to hold the cion and stock more firmly together when united, as at *c*. To complete the work, wind a narrow strip of waxed cloth around the graft and stock, covering the splice.

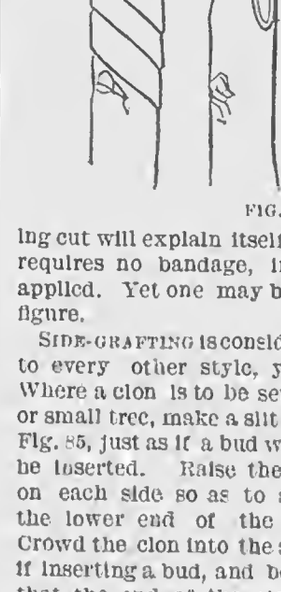

FIG. 86.

The proper season for grafting fruit trees is in the Spring when the sap begins to flow, which is earliest in the cherry and plum, and latest in the pear and apple. Straight, thrifty shoots of last year's growth should be cut either very early in the Spring or in Winter, and these may be kept in sand in the cellar until they are wanted; then the cions may be selected from them. The cion should have two or three buds upon it, though a cion with a single bud sometimes does just as well. The stock should be a tree which has stood on the spot where grafted for at least a year, as success is not as sure to follow grafting on newly moved trees.

Every member of the country home should understand grafting. It is very easy to raise almost any kind of fruit trees from seeds, to be used as stocks upon which to "work" the best varieties into cultivation. We commend the above plain instructions to our young readers both male and female. While the former may improve the fruit trees of the farm, the latter may busy themselves with grafting hardy ornamental shrubs, or indeed lemons, oranges, geraniums, roses, abutilons and scores of others. It is a delightful pastime and one which may lead by a very short route to a closer study of plant life and a wider, more intelligent and appreciative view of the blessings of farm life when rightly conducted.

GRAFTING AND BUDDING ORNAMENTAL TREES.

The operation of budding and grafting is widely practiced wherever fruit and ornamental trees are valued. It is considered more or less difficult, according to the favoring conditions of soil, climate and peculiarities of any special tree. Many trees, particularly ordinary fruit trees, may be grafted with little difficulty, provided the conditions relating to maturity of wood and sap in both stock and cion are considered.

With the different sorts of ornamental trees the operation is more difficult. A successful grafter requires faculties, experience, and, above all, devotion to his work, that few possess. To such men particularly the dissertations on the best style of grafting with which essays and books on plant propagation teem, appear of very little importance as compared with the deeper import of the relative actions of the functions and affinities of the plants with which he proposes to deal. A true expert will invent peculiar methods of grafting for himself and think nothing of it. It is simply his way of getting at the end he has in view, and he well knows that the very next problem he undertakes may require the adoption of an entirely different and equally novel method. For instance, I know a distinguished grafter who finds he can use, with the best results, in a great many cases, what he calls the side graft, whereby the flow of sap in the stock is comparatively little disturbed, and a union is secured with a minimum of shock to the regular functions of the plant. But he does not always employ this side-graft by any means, and is perfectly aware that with different plants in other climates and soils a totally diverse method would often be necessary.

I have expressed myself thus fully as to the difficulties of grafting and budding, not with the object of discouraging any one from seeking to learn the art, because a fair knowledge of it is unquestionably within the reach of any one who will pursue it persistently and with some degree of attention. It has simply been my wish to correct the common misconception that a few general directions and suggestions in essays and books are alone likely to do very much towards developing experts in budding and grafting—the most difficult department of propagation. Hints and the statements of particular facts bearing on the practice of grafting, I believe to be useful as an assistance and stimulus to those striving to learn the deeper things of the art for themselves.

To this end I propose to name a number of prominent ornamental trees, with something about the peculiarities of their grafting, in the neighborhood of New York. West and north, the peculiarities mentioned may in certain cases be entirely wanting. I shall mention genera rather than species, because, as a rule, the members of one genus may be treated in the same manner by the budder and grafter.

MAPLES.

All the species of this genus cannot be grafted alike on the same stock, and they form, therefore, an exception to the rule just stated. It is a question whether we shall not find so many exceptions to this rule as to destroy its value, unless we strain the meaning of the old adage, "the exception proves the rule," to its utmost limit. To the grafter the maples divide themselves into special and distinct types. Norway Maples must be *worked*, that is, budded or grafted on Norway Maples; Sycamore Maples on Sycamore Maples and Silver Maples on Silver Maples. The sap of maples moves early in Spring, hence the operation of budding or grafting, to be successful, must be performed as soon as practicable during late March or early April. The Sycamore varieties may be budded about the end of July, as the proper movement of sap for budding begins earlier in this case than in other species, the budding of which must be delayed until August. Maples, elms and sundry other ornamental trees are liable to develop too exuberant a flow of sap in the stock during what is usually considered the most favorable season for budding. In such cases the eyes of the stock are said, in technical terms, to be drowned with sap. The remedy is delay until the stimulated pulse of the plant has subsided a little to a more moderate beat.

BIRCHES.—Budding in early August preferred. May be grafted successfully during the beginning of Spring.

HORSE-CHESTNUTS.—Budding in July preferred, because their sap rises very early. May be grafted also in the beginning of Spring.

CATALPAS.—May be grafted during April and budded in August.

BEECHES.—Budding so difficult as to be practically out of the question. As a *tour de force* budding beeches is possible, of course, but not worth striving for, since excellent plants are readily obtained by grafting in April. The cions used in this case should consist of one-year-old attached to a portion of two-year-old wood, instead of merely the one-year-old wood generally used.

THORNS—May be budded in July or grafted in Spring, like pears, to which they exhibit an affinity.

ASHES.—It is a curious fact that the European Ash (Fraxinus excelsior) makes the best stock on which to graft all ashes, even American species and varieties. The explanation of this is hard to give. When we remember that maples can be only grafted each on its own type within very strict limitations. Such perplexing behavior of plants puzzles the grafter continually, and teaches him to be humble and not to dogmatize, be his experience ever so great. Ashes may be grafted and budded in April and August, like so many other trees.

MAGNOLIAS.—Budding in August preferred.

OAKS.—Grafting in April preferred. Budding very difficult and seldom attempted. Some varieties must be grafted with cions consisting of one-year-old attached to a portion of two-year-old wood, like those used for beeches.

SOUTHERN CYPRESS.—May be grafted at the end of April or early in May. Seldom, if ever, budded.

Elms, lindens, chestnuts, poplars, willows, locusts and sophoras may all be grafted and budded in April and August. On account of the early flow of sap in the Spring, it is wise to cut well-selected cions in Fall, after one or two sharp frosts have matured them, and bury them in a dark cellar for future use. Budding evergreens is not to be thought of, and grafting evergreens out-of-doors can be done only with great difficulty and uncertainty.

SHRUBS generally are grown readily from cuttings; but sometimes grafting is employed for the sake of making a stronger and more shapely plant. I may mention as prominent illustrations of the use of grafting, as applied to shrubs, certain varieties of the euonymus, althæa, lilac, viburnum, &c. In all these cases, the stock employed is a readily obtained form of the same genus. Two genera of shrubs present notable instances of the advantages of grafting in certain cases over other methods. Rhododendrons and Hardy Azaleas, when grafted, make more shapely plants and attain well developed foms sooner than by any other method of propagation; but to propagate them in this way is no easy task in the climate of America.

In recommending budding and grafting for many trees and shrubs, I have not given the preference to either, and perhaps after three or four years, when the grafted plant is established, it would be hard to say which produced the most satisfactory results. The experienced propagator, however, recognizes that one produces quantity most readily and the other quality. Budding is done far more quickly and with less effort, while grafting produces a vigorous growth the first year, better fitted in every way to bear the strain of the following Winter than the comparatively weak early growth of the budded plant. It is no little advantage, moreover, in favor of grafting, that a well-established tree for transplanting may be thus obtained in half the time. For fruit trees, and certainly for easily budded plants, we need seek no better method of propagation than budding; but for most ornamental trees, especially for those difficult to propagate under any circumstances, grafting is greatly to be preferred. S. P.

HARDY ORNAMENTAL TREES AND SHRUBS FOR NEW ENGLAND.

As a few among many hardy trees and shrubs adapted to ornamental grounds I desire to call attention to the following as deserving the attention of planters.

THE TULIP OR WHITE-WOOD TREE.—This is a hardy tree though somewhat difficult to transplant, especially when taken from the forest. It is therefore better to get choice, well grown specimens from the nursery; those at least twice transplanted are best. This tree needs great care until well established when it rivals in symmetry and beauty of foliage and flower any deciduous tree, and will withstand our climate successfully.

THE YELLOW OAK.—This is another tree difficult to transplant, but one of rare value and beauty, and when finely grown, it is admirable for its fine, glossy foliage, its excellent proportions and its handsome cluster of acorns. Withal, it makes a rapid growth and is worthy of the highest praise.

THE WHITE OAK AND PIN OAK are also handsome trees, each having its distinctive character and beauty.

THE MAPLE FAMILY is deservedly popular and among its members perhaps none surpasses the Sugar Maple, a tree of compact growth making a dense shade, and from the bursting of the vernal buds to the beautiful hues of October it is a continuous beauty. The Silver Maple is a rapid grower, making a grateful shade. The Scarlet Maple is beautful in Spring, with its scarlet bloom, and in Autumn with its brilliant red. The Purple Maple is also a distinct and handsome variety well adapted for ornamental planting. The Norway Maple, with its strong growth and its dense foliage, is also popular.

ASHES.—The White Ash is also a beautiful tree which has not been properly appreciated. The Black Ash is also desirable for moist land.

THE AMERICAN WHITE ELM for grandeur and majestic proportions is surpassed probably by no forest tree. New Haven, Connecticut, "The City of Elms," furnishes a notable example of the beauty of this tree. There are, however, fine specimens of mature elms all through New England, which add wonderfully to the landscape, but the trees always need ample room from the outset to develop their grand proportions. This elm and all the maples transplant safely and grow rapidly.

THE AMERICAN DOGWOOD is a tree of great merit which has been, to a great extent, overlooked. When well grown it is pretty in form and foliage, handsome in bloom in early Spring and surpassingly beautiful with its brilliant hues in Autumn.

THE BLACK, YELLOW, AND CANOE BIRCHES are all fine in form and foliage, and for street or park planting should not be omitted.

THE NORWAY SPRUCE I consider by far the best tree for wind-breaks, as it is of rapid growth, very hardy and very effective for that purpose.

THE HEMLOCK I place in the first rank for hedges, although the American and Siberian Arbor-vitæs are hardy and good.

EVERGREENS FOR LAWN-PLANTING. Among the best trees for this purpose are the White, Scotch and Austrian Pines; the Norway, Hemlock, White, Eastern and Conical Spruces; the Japanese Retinisporas plumosa, aurea, squarrosa, pisifera and filifera. These I find reasonably hardy and beautiful.

CHOICE DECIDUOUS SHRUBS.—Rose and White Almonds, althæa in variety; hardy azaleas; Calycanthus floridus; Cydonia Japonica or Japan Quince; Deutzia crenata, fl. pl; Deutzia gracilis; forsythia; Hydrangea paniculata grandiflora; Lilac, common, Cut-leaved and Persian; Spiræa prunifolia and Reevesii; Weigela rosea and variegata.

EVERGREEN SHRUBS.—Rhododendron roseum elegans, and roseum superbum for colors and album elegans and album grandiflora for white.

FOR CLIMBERS the following are excellent:—Akebia quinata, Ampelopsis quinquefolia, A. Vietchii togother with clematis, honeysuckles and wistarias, all in variety.

All the above, properly arranged, will be found hardy and excellent. The list might be greatly extended.

The Seckel, Tyson, Beurre Superfin and Doyenne Boussock Pears; the Lombard, Quackenboss and German Prune Plums; the Governor Wood, Biggarreau and Downer's Late Red Cherries may also be tolerated on the lawn as combining the useful with the beautiful.

Middlesex Co., Conn. P. M. AUGUR.

SOME OF THE BEST HARDY ROSES,

With Brief Hints as to Culture.

W. C. BARRY,

I KNOW of no hardy plants which will render a garden more interesting and attractive than a choice collection of roses. There are many persons who suppose that rose culture is exceedingly difficult, and who for this reason are unwilling to attempt it. This is an error, and the object of this article is to demonstrate how easily the rose may be grown, as well as to call attention to some of those varieties which are best adapted for general cultivation.

LOCATION.—One of the principal requisites of the rose is a genial situation. We should select the best spot in our garden; a place which is protected from bleak, cutting winds, and sheltered from the full force of a mid-day or afternoon's sun. Too much shade must be avoided, as well as proximity to hedges or overhanging trees. An eastern aspect, where the full benefit of the morning sun may be obtained, is the best. A hedge, wall or fence on the north, south and west sides will afford the necessary shade and shelter. Fences and walls, usually unsightly, may be rendered very ornamental by covering them with climbing vines and running roses. S. Reynolds Hole, the well-known rosarian, says:—"The rose garden must be both exposed and sheltered, a place both of sunshine and of shade. The center must be clear and open, around it the protecting screen. It must be a fold wherein the sun shines warmly on the sheep and the wind is tempered to the shorn lamb—a haven in which the soft breeze flutters the sail, but over which the tempest roars, and against whose piers the billow hurls itself in vain."

To secure the best results our roses should be kept together and planted in rows in a prepared border, or in beds; when scattered about the garden it is difficult to give them the care which they require. If we are content with moderate results, we can plant them here and there in the garden, where they will produce a fine effect; but we must not expect such fine blooms as can be obtained from those plants which have the benefits of rich soil and shelter.

SOIL.—It is absolutely necessary that the soil should be well drained. The rose is a great feeder and luxuriates in a rich, stiff loam, such as is found in a well cultivated garden. If the soil is sandy and light, it should be made heavier by the addition of cow manure, clay or loam. If too heavy and stiff, lime, leaf mold and stable manure should be applied.

MANURES.—No plant that I am acquainted with shows so quickly the advantage of a well prepared soil as the rose. In rich ground it makes a luxuriant growth and yields flowers in the greatest profusion. In poor soil it makes no growth and quickly becomes the victim of disease and suffers from the attacks of various insects, so that it becomes necessary, if you wish success with your roses, to plant them in good ground, properly enriched in advance with well decomposed manure. Fresh manure incorporated with the soil just before planting, is apt to injure the roots of the plants, and unless suitable manure can be obtained it is better not to use any until after the plants have started; then the manure can be applied on the surface of the ground as a top-dressing and be left as a fertilizer through the Summer. It will keep the soil cool during the hot, dry weather, and will prevent the plants from suffering from drought. Then in the Fall, say in November, give each plant a liberal supply of the best cow manure, leaving it around the plants during the Winter and turning it under in April. Of all the manures which I have experimented with cow manure shows the best effects—spent hops mixed with cow manure add value to the dressing. This mode of manuring should be practiced every Autumn. Liquid manure is very beneficial and can be applied occasionally during the Summer, but care must be taken that it be not too strong; make it weak and apply it frequently.

PRUNING.—This is an operation of great importance. We find the early Spring, before the plants have commenced to grow, the best time to prune. Some varieties require to be cut back more than others; but a rule which will apply generally is to shorten the strongest stems of last season's growth to about 18 or 24 inches and cut out all weakly growth. We take it for granted that the bushes make a growth of from five to seven feet during the season. In my garden several varieties make an annual growth of eight to nine feet, that is, when not summer-pruned. A great many are afraid to use the knife vigorously and their plants suffer materially on this account. In order to obtain flowers in Autumn the plants may be slightly pruned in July after the flowering season is over. The plants will then produce a quantity of blooms again in September and the shape of the bushes will be improved.

PLANTING.—The Spring is the best season for planting, although where the Winters are not severe it can be done in Autumn. It is highly important to plant early, as roses suffer extremely if set out after the growth has started. April is the best time in this locality. Secure your plants early, and if they are budded on the Manetti, plant them so that not only the stock but also a portion of the bud will be covered with earth. This will enable the plant to send out roots above the bud, and in a short time the bush will be on its own roots. This point is worthy of serious consideration. If you do not set out the plants yourself see that your gardener observes this suggestion. I prefer budded plants, except for beds, to any others, as you obtain a stronger growth and larger and finer flowers than you do from plants on their own roots. Some object to budded plants on account of the suckers they send up. These suckers will not appear if the planting is properly done, and any one who loves roses will soon learn to distinguish the stock from the plant, and as soon as a sucker appears it will quickly be cut out.

PROTECTION IN WINTER.—To protect against injury from severe weather in Winter, I would recommend laying down the shoots in the Autumn, the same as is done with raspberry canes. In bending the stems be careful not to break them and cover with a few inches of earth, leaves or branches of evergreens. Sometimes the shoots make such a strong growth that it is almost impossible to bend them without breaking. In this case it is better to tie them to stakes and cover them with straw. A little practice and experience, however, will enable any one to lay down roses without injuring them.

CARE AND MANAGEMENT DURING THE GROWING SEASON.—Having procured strong, thrifty plants, and having set them out properly in well prepared soil and in a good situation, your roses ought to make a good growth. If dry weather should prevail, liquid manure, well diluted, will be very beneficial. One of the greatest secrets of success in rose culture is to keep the plants in a thrifty condition. As long as the plants are in robust health they easily resist the attacks of insects, and with a little assistance from us they gain the battle every time.

We hear it said frequently, "If I could only keep off the insects, my roses would thrive." At the outset I am going to be plain and tell you that insects are numerous, that they are great foes and can be conquered only by great industry and perseverance. Now, if we esteem our roses as we ought to, we will be willing to devote some time to them every day. To the ardent lover of the Queen of Flowers, nothing is pleasanter than each morning to make a tour of the rose garden while the plants are yet sparkling with myriads of dew drops. How can we pass an hour more pleasantly than in examining the variety of growth which the different kinds exhibit, in comparing the peculiarities of habit, in noting the marked vigor of some sorts, the thorny shoots of others and the beautiful foliage with which some varieties are clothed, and, while engaged in this examination, let us keep on the lookout for the rose caterpillar, which in May makes its appearance rolling itself up in the leaves. Its presence is easily detected, and we must at once make up our minds to put an end to its career by crushing it between our thumb and fingers. Go over every plant every day and rid them of this pest. The rose slug appears in July and August, and eats the leaves. It can be disposed of by hand-picking and by syringing the plants with a weak solution of whale-oil soap. White hellebore, sprinkled over the plants while the dew is upon them, will keep off other insects.

ROSES IN BUSH FORM.—The bush form is the one usually adopted and is perhaps, on the whole, the most satisfactory. Roses grown in this way produce the finest blooms and furnish flowers a longer time than when pegged down.

ROSES PEGGED DOWN.—This is a method of bending the shoots so as to make the plants low and dwarf. It is practiced to great advantage when making beds of roses upon the lawn. Plants intended for growing in this way should be allowed to make their first season's growth in the usual way. Early the following Spring shorten the longest and strongest shoots a little and cut away the weak stems. Then, before the buds start, bend the shoots toward the ground and fasten them to it by wooden pegs or hooks such as you can obtain at any pile of brush. It is surprising what a quantity of blooms will appear on each shoot making a superb display; but there is this disadvantage, that all the flowers appear nearly at one time, and there is not that succession of blooms that there is on the bush plant. Pegging down must be attended to every Spring, preserving and bending down the best wood and cutting out weak growth. For beds on the outer edges of borders where tall growth would be objectionable, this method can be practiced.

Varieties.

I shall recommend only those which can be grown to the best advantage by the amateur cultivator.

ALFRED COLOMB—I name first because I regard it as the peer of any rose. It has a vigorous habit, fine foliage, and it produces carmine-crimson flowers of beautiful forms and delightful fragrance. That famous raiser of roses, Lacharme, at Lyons, who rarely, if ever, fails to give us a good rose, originated this one.

ANNE DE DIESBACH is one of the older roses, which the newer sorts have not yet displaced. It lacks fullness of flowers, but its brilliant, carmine shade is unequaled and renders it one of the most effective roses.

LA FRANCE, now claimed among the Hybrid Teas, is a rose the beauties of which it is difficult to portray. Possessing in an eminent degree the delicious fragrance and perpetual-blooming qualities of the Tea Rose, it has also sufficient hardiness to endure severe cold, when it receives a little extra care. It generally produces its choice blooms so abundantly and continuously that great injury is done to the plant unless some of its buds are removed. It is a most valuable variety, and should be included in every collection.

JOHN HOPPER, one of the old favorites, has hardly an equal as a rose for general cultivation. It is a model of healthy habit and robust constitution; its flowers are large, full, of a bright rose-color with carmine centers. Among many varieties in my garden, it has given the best results with the least care.

GENERAL JACQUEMINOT, another old and well-known sort. It is hardy and vigorous, and its blooms, though not so well formed as might be desired, are of a brilliant crimson color, which always attracts and pleases.

MADAM VICTOR VERDIER is a most beautiful, finely-formed, very fragrant, free-blooming rose, of a carmine-crimson color.

COMTESSE CECILE DE CHABRILLIANT, though not large, is the admiration of all connoisseurs for its symmetrical blooms of a delicate pink shade.

MARIE BAUMANN on account of its unequaled beauty, ought to have been placed first on the list. It resembles Alfred Colomb and is finer, but it is probably not quite so valuable, being less vigorous. Perfect blooms such as it usually yields, possess the highest qualities which could be sought after in a rose, and in competition with other sorts of its class almost invariably takes the prize.

CHAS. LEFEBVRE is rapidly becoming one of the greatest favorites. Its large, well-formed, reddish-crimson flowers never fail to excite admiration, while its good habit and fine foliage commend it to those who appreciate desirable qualities.

COQUETTE DES BLANCHES and MADAME ALFRED DE ROUGEMONT are valuable free-blooming, white roses, and yield an abundance of flowers during the Summer. There are many other white roses propagated which produce exquisite flowers, but which are of no value, as they make such a poor growth.

LOUIS VAN HOUTTE is a variety which I esteem next to La France. Its elegant form, rich, velvety maroon color, and fragrance, form a combination of desirable characteristics rarely found in a single rose. I do not hesitate to call it the best dark rose we have.

PAUL NEYRON is a real curiosity among roses on account of its immense size. Although very large, its blooms are not coarse, but handsome and showy; the plant has ample foliage, is a free grower and very vigorous; color deep rose.

BARONNE PREVOST, one of the oldest sorts, is still much admired. Its flowers are of a pure rose-color, and its habit is all that could be desired.

LA REINE, surpassed by many others in beauty of flower, is valued chiefly for its hardiness. The flowers are large, moderately full, and of a glossy rose-color.

VICTOR VERDIER is a choice sort resembling John Hopper, but devoid of fragrance. Its habit is good.

MAURICE BERNARDIN is a fine free-flowering variety, producing vermillion-colored flowers.

CAROLINE DE SANSAL bears pale flesh-colored flowers. It is one of the best of the light roses.

MADAME BOLL, an American rose, is much prized for its large carmine rose blooms and its rich, glossy foliage.

PRINCE CAMILLE DE ROHAN and BARON DE BONSTETTON are the two sorts upon which we have to depend mainly for our very dark flowers.

FRANCOIS MICHELON is a superb variety, of a deep carmine rose-color. It yields an abundance of flowers in Summer, when the other varieties are out of bloom.

MARGUERITE DE ST. AMANDE distinguishes herself as an autumnal bloomer, producing a profusion of rose-colored flowers in Autumn.

MARQUISE DE CASTELLANE verifies the adage "no roses without thorns." Its shoots are remarkably thorny; its flowers are noted for their bright carmine rose color.

BARONESS ROTHSCHILD is a charming sort—flowers large, of fine globular form and of a pale, flesh color.

MAD'LLE EUGENIE VERDIER is a beautiful and graceful rose with large, finely formed blooms of a silvery rose color.

MAD'LLE MARIE RADY bears superb, bright-red, fragrant roses.

COUNTESS OF OXFORD produces very showy carmine-colored flowers, and is the most valuable and effective variety.

GENERAL WASHINGTON, one of the older kinds, still merits a place in collections. It bears an abundance of bright red blooms shaded with crimson. Among

CLIMBING ROSES Baltimore Belle, bearing white flowers, and Queen of the Prairies, producing red blooms, are still favorites. The new hybrid climbing rose, Jules Margottin, bids fair to become valuable. Among the

SUMMER ROSES which bloom but once, yet seem indispensable, are Madame Hardy and Madame Plantier, with pure white, well-formed flowers, and the Persian Yellow, bearing beautiful bright yellow blooms. Prominent among the

MOSSES are the common Glory of Mosses, Crested and Salet.

All the roses in the above selection are valuable and desirable. Any one who is willing to observe the cultural directions given can succeed in growing superb roses. For further information on this subject S. Reynold Hole's "Book About Roses," and Mr. Hibberd's "Amateur Rose Book" are strongly recommended.

Rochester, N. Y.

ORNAMENTAL TREES AND SHRUBBERY FOR THE SOUTH.

H. W. RAVENEL.

IN accordance with your request for an article on the best evergreen and deciduous trees for the South, I propose to speak of our native trees and shrubs specially—those which are in reach of every one who wishes an attractive and pleasant home. But the "South" embraces a vast region, with great variety of temperature, soil, and other requirements of vegetation; and also a diversified flora, more or less suitable for various localities, from which selections may be made. I must necessarily confine myself to the region of which I can speak from personal knowledge, and direct attention only to those which may be useful for ornamental purposes; for improvement and decoration of lawns; for gardens, hedges, shrubberies and household surroundings. Of our

Evergreens,

THE LIVE OAK (Quercus virens), a majestic tree and king of the forests, holds the first rank. Unfortunately for the interests of horticulture, its habitat is rather restricted, and beyond the damp, rich soils of the Southern seaboard, it seldom attains to its imperial proportions. The shape and form of this tree are peculiar. With a trunk sometimes four to five feet in diameter, it rarely reaches beyond 50 to 60 feet in hight. The trunk soon becomes forked and divided into gigantic limbs, which extend on all sides around the base, almost touching the ground, and covering a space of 50 or 60 feet in diameter. The upper portion is again subdivided, until the main axis of growth is scarcely recognizable, the whole tree forming a compact, oval or rounded head. In the vicinity of Charleston, for some 15 or 20 miles around, there are many magnificent avenues of these trees, considerably over 100 years old, planted out in colonial times by the wealthy proprietors at their country-seats. Some of them are nearly a mile long and consist of four rows of these veterans, throwing out their huge limbs on all sides, and intercrossing each other so as to form a dense shade. These trees are the favorite resting-place of the Long Moss (Tillandsia), and are often so much covered with this long, gray drapery as to present a sombre aspect at a distance.

THE "BIG LAUREL" (Magnolia grandiflora).—This splendid tree, with its thick, glossy leaves and huge white, fragrant flowers, attaining a hight of 60 to 80 feet, is one of the finest evergreens known. Its native range is along the seaboard, from North Carolina to Florida, and beyond the Mississippi into Texas; but it is now in cultivation all through the South, and improved varieties are already known. Unlike the Live Oak, it has a bare, smooth trunk, and a regular pyramidal head. I have seen splendid specimens of this tree in the neighborhood of Darien, Ga., in Florida, and in Texas, near Houston, with trunks two to three feet in diameter.

WILD ORANGE—WILD OLIVE (Cerasus Caroliniana).—This favorite evergreen is extensively cultivated along the Atlantic States. Though not as large as the Live Oak or Magnolia, rarely exceeding 30 or 40 feet in hight, it is so easily propagated by seeds, and of such rapid growth, that its cultivation has extended all over the country, and in certain sections one will find every homestead surrounded with trees of this kind. It bears excessive pruning and may be brought into any required shape. For tall hedges, or any fanciful form, it is peculiarly adapted. The rich, glossy leaves in Winter, with racemes of white, pendant flowers in early Spring, give it a cheerful aspect. Hedges or low-branching trees should be protected from cattle, as they are fond of the leaves, which, if eaten too freely, are poisonous. Although called Wild Orange or Wild Olive, it has no affinities with either, but belongs rather to the Wild Cherry family.

We have other evergreens of smaller size, but none as suitable for home decoration as those above named. The Sweet Bay (Magnolia glauca) is an evergreen in this latitude; but the form of the tree and the foliage are defective. I have seen the Loblolly Bay (Gordonia Lasianthus) and the Red Bay (Persea) used for that purpose, but they want compactness of form to render them attractive.

Our ornamental evergreens are mostly confined to the broad-leaved species; but the Red Cedar is highly prized in certain localities, and I have seen two "Old Field Pines" (Pinus tæda and P. mitis) used for large lawns with good effect, by placing them far enough apart to encourage the growth of the lower limbs, thus giving a pyramidal form of compact growth, instead of the tall, bare trunks which are seen in the woods. Of

Deciduous Trees

we have a much greater variety, and for the average country home there are always many good kinds in every neighborhood from which selections can be made.

THE OAKS hold the first rank, and are so universally distributed that there need be no difficulty in obtaining fine shade and ornamental trees in every region of country. The Water Oak and the Willow or Laurel-leaved Oak are probably the favorites on account of their symmetrical form, compact heads and dense foliage. As a general rule, the small-leaved trees are to be preferred for the lawn, as more attractive for beauty of form and a more perfect shade than those with large leaves. These do not attain to so great a size as the Black Oak, the Scarlet Oak, and the Red Oak, which three last I have seen used with fine effect upon the strong clay soils of the middle and upper regions of the Atlantic States.

THE ELMS are also favorite trees for the lawn, both the common and the Feathered Elm. The former is the larger tree, and on rich, damp soils will attain a hight of 50 to 60 feet. The spreading limbs, drooping branchlets and dense foliage make it one of the most graceful trees. The Feathered Elm is a smaller tree, of more compact and rigid growth.

MAPLES, POPLARS, the SYCAMORE, and the TULIP TREE are often used, and there are many others which may be employed to advantage where the oaks and elms cannot be had.

THE PRIDE OF INDIA (Melia Azedarach), though an exotic, is so thoroughly naturalized and now so extensively used throughout the South as to deserve notice. For gracefulness of foliage there are few trees more ornamental. The clusters of lilac flowers open in Spring just as the young leaves are expanding, and the yellow berries hang on the trees all Winter. It grows readily from seed, is of rapid growth, and makes a compact, well-formed tree of some 30 to 40 feet in hight. The wood of old trees, though coarse-grained, is of a dark-brown, and I have seen cabinet-work made of it that would compare in beauty with that from the walnut and maple.

Hedges for fencing purposes are not common at the South. I have seen the Cherokee Rose, the Osage Orange, and two or three species of Thorn (Crataegus) used, but they are all more or less unsatisfactory—perhaps for want of the proper management. For

Ornamental Shrubbery

and hedge work about gardens, the beautiful exotic,

EUONYMUS JAPONICUS, has become the general favorite. It strikes readily from cuttings, grows rapidly and soon forms a dense, compact mass of dark-green foliage. It is easily pruned into any desirable shape, and preserves its rich, glossy foliage throughout the year. The older plants mature seed abundantly, and the scarlet berries in Winter give additional attractiveness.

THE WILD ORANGE is also extensively used for hedging and ornamental shrubbery, by cutting back the plant when young and by pruning afterward.

THE RED CEDAR is also very much used for

hedge work and for training into shape, and so also are the Arbor-vitæ and Tree Box. Among

DECIDUOUS SHRUBS often seen in Southern gardens may be mentioned the Fringe Tree (Chionanthus), the Sweet Shrub (Calycanthus), the azaleas, and the different species of styrax. Of course, there are many more native shrubs that could be brought into cultivation, and the flora of every section of country could furnish many kinds well worthy of a place in the garden. Of the

CLIMBERS, our fragrant Yellow Jessamine (Gelsemium) is found in almost every garden. The two Trumpet Vines, Bignonia and Tecoma, are also freely used. Among evergreen climbers, special mention must be made of our native China Briar (Smilax Pseudo-China). It gives a dense foliage of rich, dark-green berries, which are specially beautiful in Winter, and the sprays of graceful foliage are used for Christmas decorations, in preference even to the ivy.

Aiken Co., So. Carolina.

COUNTRY-HOME GARDENS IN CALIFORNIA.

W. C. L. DREW.

MANY years' experience in the flower garden, and careful observation of the house gardens of El Dorado County, have made clear to me three great facts in regard to the beautifying of the grounds, large or small, surrounding the homes of the middle classes in California. The first of these facts is that shrubs of a flowering nature particularly, and those remarkable for handsome foliage, are a necessity in all such grounds. Those bearing conspicuous flowers, as a rule, furnish their blooms at a period when, without them, the garden would be almost bare of floral treasures wherewith to build a bouquet, to decorate the room or to charm the eye of the passer-by.

In the early Spring, immediately following in the wake of the hyacinth, tulip and crocus, we find the Spiræa prunifolia, Syringa or Mock Orange, lilac and cydonia. These and several others furnish us with flowers during the two weeks, or more, between the flowering of the early Spring bulbs and that of the earlier annuals and bedders. During a lull in the blooming of our bedders in the late Summer, the shrubs again come to our rescue, and we have the Hydrangea grandiflora, Spiræa Douglasii, and others equally desirable.

The second fact which has come under my observation is that by a careful and judicious selection of shrubs, flowers may be had the entire season, from January to December, in a much less space than would be required for the cultivation of any other class of plants known to me.

For this reason alone the growing of flowering shrubs is to be highly recommended to those having home grounds. In our climate I find the list of shrubs requisite for this continuous blooming in the open ground, would be in order of flowering: laurestinus, Spiræa prunifolia, weigela, lilac, Syringa or Mock Orange, Jessamine, Spiræa Billardii and callosa, shrubby clematis, Althea, or Rose of Sharon, Deutzia gracilis and crenata, Hydrangea hortensis, and grandiflora, the bright berries of several other varieties closing the Christmas season. It may not be out of place here to state that our laurestinus is now—Jan. 20,—in bloom and loaded with buds in the open ground. I would particularly impress on the reader that the above list has been made out with reference to the time of flowering in El Dorado Co., Cal. and this might not be exactly the same in other localities. In order to prevent any disappointment in selecting therefrom, the list should be varied according to locality.

The third fact which I would endeavor to bring to the mind of the reader is that shrubs will furnish the greatest amount of pleasure at a minimum of outlay in money and labor. The first cost of shrubs for planting is about one-third that of bedders or other plants; the labor required in their care and planting is almost nothing compared with that demanded by annuals and bedders.

But let not the reader misunderstand me. I do not mean to say shrubs require no care: they must be well attended to; they must be trimmed in proper season and have a liberal supply of fertilizing material, and an occasional drink of pure, fresh water. Without these requisites no plant can give satisfaction. Nor would I have the reader understand I have named all the desirable shrubs, but merely a few of those sure to give satisfaction.

El Dorado Co., Cal.

ORNAMENTAL TREES AND SHRUBS IN NEBRASKA.

THE embellishment of dwellings and their surroundings in both town and country, is becoming quite fashionable. Everything which is at all hardy grows well here, although our temperature ranges from 31° below zero to 129° above. Dooryards protected from our high winds by hedges, show to good advantage at all seasons. Our Cotton-woods, Box Elders, Soft and Silver-leaved Maples, White Ash, and Kentucky Coffee-tree, as well as our dear little Scrub Oak, the scrubbiest of all scrubs, are native, and, being easily obtained, form the majority of our ornamental trees. Few dwellings are without some of them, and when age gives them their crowning beauties, they impart an air of antiquity to this new country.

The taste for trees, beyond the mere fire-wood necessity, is growing, and many are attempting a little landscape gardening on a small scale, which attracts much attention, and excites rivalry. Willows in variety, Osage Oranges and Honey Locusts are used as hedges, while evergreens, which come out of a man's pocket (the others only come out of their native wilds, excepting the Osage Orange) are employed sparingly—just as one can spare the money. The only native shrub, the Barberry, is not appreciated here, to my surprise.

However, we have a small tree, native to the hills and river bluffs, which I have but seldom seen anywhere else. In its wild state it is a rusty, bronzy green, grows wherever it can get a chance, and won't grow anywhere else; yet thousands are to be found around every house. Traditionally, it is called Cupressus thyoides. (?) It is generally supposed to be an evergreen, though neither white nor green, and as soon as it is transplanted to civilized quarters, it shows its abhorrence of its new condition by turning a dirty, rusty, yellowish-brown, and staying so. At once the women take up this exponent of stubbornness, and whenever "company" calls, begin (after the weather and the babies are exhausted) to talk about how "Jake dug 'em up, an' set 'em out, an' they all died." This tribe of underbrush is one of our most valuable plants (after corn and "'taters"), as it furnishes food for conversation in the driest and dreariest of seasons, while its "pecooliar" color is at all times a pleasing contrast to our beautiful green prairies, or our snow-clad bottoms.

I call them "nevergreens" and have applied for a patent for the name. S. RUFUS MASON.

Dodge County, Neb.

Hardy Ornamental Grasses.

A bed made up of the handsomest of the hardy ornamental grasses, all plainly labeled, becomes an interesting and instructive part of any garden. While for the purposes of the present special number of the RURAL NEW-YORKER, so great a variety is not to be thought of, there are yet several kinds of grasses which we think are entitled to a place among the best of hardy shrubs and trees. We have had the Zebra-striped Eulalia (pictured, March 23, 1878) ever since it was first introduced, and our opinion is that it should be placed at the head of ornamental grasses. The leaves, as they first appear in Spring, are green. Later a cross bar of creamy-yellow appears here and there until at length the alternations of green and white have assumed some regularity. It blooms in late August forming plumes from one foot to eighteen inches in length which, like those of the Pampas Grass, may be preserved from year to year. There is also a longitudinal-striped Eulalia that has been known among us for 10 years or more. The Zebra-striped has proven entirely hardy at the Rural Grounds. Erianthus Ravennæ is another perfectly hardy grass we can fully recommend to our readers. The flowering stalks grow eight feet tall, bearing dense feathery plumes often two feet in length—equaling in beauty those of the Pampas Grass as grown in this climate.

Twenty Best Hardy Roses.

A very charming rose may be a very poor grower and therefore not adapted to general cultivation. After recognizing the merits of many new varieties, I find myself coming back to my old favorites, and were I planting twenty varieties of hardy roses for myself, I should choose the following:

HYBRID PERPETUALS: Gen. Jacqueminot; Caroline de Sansal; Baronne Prevost; Madame Louise Carique; Duchesse de Caylus; La France; Coquette des Alpes; Prince Camille de Rohan; Glory of Waltham; Charles Lefebvre; Reynolds Hole; Jules Margottin; Auguste Mie; Stanwell.

JUNE BLOOMING—Madame Plantier; Yellow Eglantine.

Moss—Princess Adelaide; A Feuilles Pourpres.

CLIMBING—Queen of the Prairies, Baltimore Belle. S. B. PARSONS.

Plan for the Grounds of a Country Home.—After "Suburban Home Grounds," by F. J. Scott.

A (on the left), Arbor-vitæ; h, Laurel-leaf Willow; d, g, Magnolias; f, Red-bud (Cercis Canadensis); e, b, Hemlock Spruce; a, Norway Spruce; i, j, k, l, different varieties of evergreen trees; m, n, White Pine; o, Scotch Pine; p, q, r, shrubbery clump; s, Shrubbery clump; t, Yellow-wood; u, u, Shrubs (dwarf), evergreens; y, Virginia Fringe; X, X, Great-panicled Hydrangea and Stuartia Pentagyna; A Catalpa speciosa; C, C; Y, Y, Fruit trees. See page 99, fig. 66.

Progress of the Revolution.

THE story of the march of this very remarkable enterprise, which is told on another page, is attracting wide attention and arousing the enthusiasm of many of its patrons and the anticipations of thousands who have been curiously watching the movement. Among the new books lately announced and in press for immediate publication are, Green's Larger History of the English People, reduced from $10 to $1; the Useful Dictionary, containing more than one-third as much as Webster's Unabridged, for 80 cents; Irving's Sketch Book, and Irving's Knickerbocker, in very handsome form, for 35 and 30 cents; Cooper's Last of the Mohicans, 30 cents; and Plutarch's Lives, 60 cents. Their most important work, the Library of Universal Knowledge, a cyclopedia in large type, containing 10 per cent. more matter than Appleton's Cyclopedia, has reached its eighth volume. At its nominal cost of $15, in elegant and substantial cloth binding, 15 volumes octavo, it is, of course, meeting with an enormous sale. The new version of the New Testament, in large type, at a nominal price, is promised immediately upon its publication in England, which is now daily looked for. To answer the demands of those who may be curious to compare the new with the old, an edition will be published in which the two versions will be given upon opposite pages.

TROPIC-FRUIT LAXATIVE is the best and most agreeable preparation in the world for constipation, biliousness, etc. One-half to one lozenge is the dose. Price 25 and 60c. per box.

For the delicate and complicated difficulties peculiar to the female constitution, LYDIA E. PINKHAM'S VEGETABLE COMPOUND IS the sovereign remedy. It aims at the cause, and produces lasting results. Send to Mrs. Lydia E. Pinkham, 233 Western Avenue, Lynn, Mass., for pamphlets.

The constantly increasing sale of BURNETT'S COCOANE, confirms the opinion of the best judges, that it is equal, if not superior, to any domestic or foreign. It also received the highest award at the Centennial Exhibition.

TREES. TREES.

The Sugar Maple is without doubt one of the best trees for the planting of Streets and Parks. We have a large and fine stock which we will make at low rates by the 100 and 1,000.

Send for our Spring Wholesale Catalogue and *special rates* on Ornamental Trees.

FREE TO ALL!—SEVEN VALUABLE AND USEFUL GIFTS!
Special Offer! Desiring to double the already extensive circulation of our popular literary and family paper, THE CRICKET ON THE HEARTH, we make the following grand, unprecedented offer: Upon receipt of One Dollar (the regular subscription price) we will send THE CRICKET ON THE HEARTH to any address for One Year, and in addition we will send, free and post-paid, Seven Valuable and Useful Premiums, as follows: 1. An Elegant Coin Silver-Plated Sugar-Spoon, of the beautiful and stylish Lily pattern, manufactured by the well-known firm of Rogers & Britain guaranteed heavily plated with pure coin silver, and an article alike durable, useful and handsome. 2. Fine, Heavy Silver-Plated Fruit Knife. An entirely new and very handsome pattern in a fruit knife, guaranteed heavily plated with pure coin silver—an article that every family needs and should have. 3. The Oriental Barometer. This very useful article consists of a barometer in the form of a beautiful flower, the colors of whose leaves change by the action of the atmosphere, correctly foretelling the changes in the weather several hours in advance; in addition to this, it is a most attractive ornament for hanging in the room. 4. An Imported Box of Paints, containing eighteen colors, with brush and all complete. The possession of a box of paints has always furnished to the young a most useful and absorbing pastime; this is not a cheap article, but one of genuine merit. 5. The Fan Autograph Album, consisting of an autograph album in the form of a fan, and a combination of the two, an article which every young lady should possess, and very desirable for balls, private parties, pic-nics, etc. 6. Handsome Imitation Coral Breast-Pin, of a new and very handsome design, unlike anything ever before introduced; a stylish, useful and durable piece of jewelry. 7. Pocket Comb in Case, a handsome comb made of an entirely new material of a bright garnet color, superior to rubber, and enclosed in a neat and serviceable case. Remember, we send, not one, but the entire list of seven valuable and costly premiums above described, together with a whole year's subscription to THE CRICKET ON THE HEARTH, upon receipt of only One Dollar. The premiums are not cheap, trashy articles such as are usually offered, but are guaranteed to be the most valuable and costly articles ever given with any publication. All the subscribers that we secure this year we desire to retain for future years; hence we cannot afford to give as premiums anything but genuine, first-class goods. THE CRICKET ON THE HEARTH is now in its tenth year of successful publication. It never misses an issue, and is known the world over as the most entertaining, instructive and fascinating family periodical published. Each issue contains 16 mammoth pages, 64 columns, size of page 11 x 15 inches, and is filled with the choicest reading matter, comprising Serial and Short Stories, Sketches, Poems, Useful Knowledge and Valuable Information upon every topic of interest, Stories, Sketches and Puzzles for the Young, Farm and Household Hints, News of the Day, Wit and Humor, etc., etc.—in brief, it is a complete family periodical in every particular, and just such a one as is needed in every household. This is a Grand Special Offer, made to introduce the paper into new homes, and to increase our circulation. We guarantee that the premiums alone could not be bought at any retail store in the country for less than $1.50. You secure them all absolutely free by subscribing for our paper under this special offer. Send at once, and if you are not perfectly satisfied with your bargain, your money will be cheerfully refunded. As to our reliability, we refer to any publisher in this city. For $5 00 we will send six subscriptions and 12 premiums. Address S. H. MOORE, Publisher, (*Successor to Moore & Wilson,*) 245 Broadway, New York.

The Literary Revolution.

Story of the March.

The foundation of this enterprise was laid in New York, by the manager of the American Book Exchange, in September, 1875, the capital in hand consisting of about fifty volumes of old books, about $70 in cash, and a favorable acquaintance with some thousands of READERS throughout the United States, with whom he had had dealings previously. For nearly three years the business was limited to *exchanging* second-hand books and selling miscellaneous new books. In March, 1878, the business had grown to such extent that the American Book Exchange was organized as an incorporated company, and the business already established was transferred to it.

The entire business transactions of the year 1878 aggregated about $30,000. In the autumn of 1878, it was decided to enter into the business of *publishing* as well as selling books.

In January, 1879, the first volume was published, being volume one of "Chambers's Cyclopædia of English Literature." The cash sales for the year 1879 aggregated about $100,000, including second-hand books, and miscellaneous books of other houses as well as its own publications.

During the year 1880, the business of the company has grown beyond all precedent in publishing. Transactions have been limited almost entirely to publishing and selling its own books. Nearly 750,000 volumes have been manufactured in the binderies of the company; over 1,000,000 volumes have been printed, and about 40,000 pages of new books put into type and electrotyped. As many as 300 pages, containing nearly half a million printers' "ems," have gone into type in a single day. For a period of more than three months, during the busy season of manufacturing, an average of over forty steam-presses were constantly printing the books. The cash sales of the year foot up $414,243.15.

This remarkable growth of the business has not even approximately kept pace with the demands of the public upon us. The limit has been our resources for manufacture.

The public has so long been taught to believe books to be expensive luxuries and low prices impossible, that incredulity has from the first been the greatest obstacle to the progress of the Literary Revolution. It was easier to make good books cheap than it was to make people believe it could be done. We could readily have made prices even lower than they have been, but for the terrible tax we have been compelled to pay to this incredulity. During the past year we have paid $77,824.85 for advertising—an item which has to come *out of the profits* we make on the books sold. Perhaps a thousand times during the year we have heard how rival publishers, who wished it might be true, have said that we *could not afford* to make books so cheap, and we *must fail*, and our friends have continually asked—can you do it?—*how* can you afford it?—*will* you continue?

As one step toward the removal of this incredulity, and thus further increasing the possibility of multiplying good books at low prices, we will give a few simple facts and figures:

"Geikie's Life and Words of Christ" was published in 1879 by D. Appleton & Co. at the price of $3.00 per copy for the cheapest edition. In December of that year we published an edition which cost:

For making the electrotype plates	$882 16
26,000 copies Acme edition printed, cost for paper and printing, at 12 cents	3,120 00
Binding of the same in cloth, at 9 cents	2,340 00
8,000 copies Aldus edition, printed, cost for paper and printing, at 17 cents	1,360 00
Binding of the same in half Russia, gilt top, at 20 cents	1,600 00
Total cost of 31,000 copies	$9,302 16
26,000 Acme edition, estimating all sold at greatest club rate of discount, 50 cents each, less 15 per cent	$11,050 00
8,000 Aldus edition, ditto at $1.00	6,800 00
Total receipts for 31,000 copies	17,850 00
Gross profits in one year from an investment of $882.16	$8,548 00

"A Dutchman's 10 per cent" profit! Do *you think* we can afford it?

As the price of paper has varied considerably during the year, the above figures are based upon the *present* cost of paper. There must of course be some further deduction made from the gross profits named to cover expenses of handling, and some small necessary expenses for advertising to customers that the book is published, but the figures given sufficiently illustrate the possibility of this Revolution.

The unexampled success of this Revolution has resulted from the fact that it has met the real wants of the public. Urgent calls are every day being made upon us for cheap editions of scores and hundreds of other good books which we have not yet published but which will in time be added to our list. There is a limit to what can be done in a year, and a very much smaller limit to what can be done in that time with our present capital. We have decided to extend this limit by enlarging our capital. Do any of the friends of the Literary Revolution want to have an interest in this enlargement? We do not *solicit* investments from them, but until $100,000 additional stock is taken, preference will be given to applications for shares of capital stock in small sums. Because the personal influence of every stockholder is sure to result in strengthening the enterprise, we would much prefer to receive $10.00 from each of 10,000 persons scattered throughout the country, than to receive $10,000 from each of ten persons.

The stock will be issued in shares of $10 each, and is offered at par value in cash, and is *not* subject to assessment.

Dividends are declared once a year, in January, of profits accruing during the previous year. Stock issued after February 1, will receive a pro rata dividend from the full year's earnings, estimating from the time of its issue till the end of the year.

Each stockholder of the company may order, if he wishes to do so, for each share of stock which he holds, *one copy* (only) of each book which is or may be published by the company, at a reduced "stock-holders' price," viz., at a discount of one-third from the retail price-list. To illustrate: the "stockholders' price" of "Geikie's Life of Christ" would be—for the cloth edition, 33⅓ cents; for the half Russia, gilt top, 66⅔ cents; and for the "Library of Universal Knowledge," large type edition, cloth binding, 66⅔ cents per volume, or $7.92 for the set of fifteen vols., orders being received Feb. 13, the price of this work now being advanced two cents every day until the full list price is reached.

Upon this basis, a stock-holder who would wish for himself or his friends one copy of each of the 108 volumes now on our list, in cloth binding, would get all of them for $43.95, whereas the same would cost other purchasers $65.92. Thus his $10 invested in capital stock would not only earn him a yearly dividend, but would *save* him or his friends more than its face.

The number of people who can avail themselves of this advantage is limited, of course, to the number of shares, only 10,000 offered for sale. "Uncle Sam's Farm" is an immensely large one, and there will be enough people *not* stockholders remaining who will want books, from whom we can earn "profits" for "dividends."

Remittances for capital stock should be made to

JOHN B. ALDEN, President.

TRUSTEES: Chas. M. Whitney, G. Edw. Langdon, John B. Alden.
OFFICES: Counting Room, Sales and Editorial Rooms, Tribune Building.
BINDERIES: No. 8 Church street to Nos. 33 and 35 Vesey street, and No. 26 Beekman street to 18 Spruce street.
SHIPPING DEPARTMENT: No. 26 Beekman street to 18 Spruce street.

Friends of the Literary Revolution are cordially invited to visit the various departments, and see how books are made and handled. Our type-setting and printing are done under contracts in nearly a score of different offices, in one only of which is "type-setting by steam" carried on—that also can be seen by an introduction from our office.

BANKERS: American Exchange National Bank, Broadway and Cedar street; National Park Bank, Broadway and Park Row, New York City; Orange National Bank, Orange, N. J.

Reinforcements.

I predict that in a very short time the Literary Revolution will become the most popular publishing house in the world. Its patrons will include every intelligent man in the country. Herewith I hand you $10 as a subscription to capital stock. C. F. HUTCHINGS, Osage Mission, Kan.

Philadelphia, 1 mo., 22, 1881.—Respected friend: Thy postal received, and I herewith inclose a check on Girard National Bank for *One Hundred Dollars*, indorsed over to thy order. My first impulse was to take ten times this amount, but as I do not *need* to make money, and don't want to cultivate a grasping spirit, I decide to let others have the chance. But I want *ten shares*. Very truly, E. L. S.

I am a poor clergyman with a salary of about $300 per annum, yet I feel for my own sake, and also for the sake of your grand enterprise, that I can spare the above ($20) for two shares interest in the work. I wish you every success in your more than laudable undertaking. (Rev.) W. FULLER, Stephentown Center, N. Y.

I wish I could send you $500. I have full confidence in your integrity, honor, and success. For the inclosed $10 please enter my name as a stockholder. E. O. STILES, Preston, Md.

I have in my home already quite a number of your books, and my whole heart wishes you God-speed in so noble an enterprise. Inclosed please find $10 for one share of stock. MRS. JENNIE S. SQUIRES, Cortland, N. Y.

I have been a patron and friend of the company for three years. I propose to become a stockholder by sending P. O. Order, $10. L. W. BAGLEY, Scotland Neck, N. C.

Being heartily in sympathy with the Literary Revolution, and desiring to help it and myself at the same time, I inclose $10 for one share of stock. (Rev.) E. P. CLARK, Vassar, Mich.

I look upon your enterprise as one of the most beneficent educational agencies of the nineteenth century. You are certainly doing wonders in elevating the literary tastes of the people of this country. Inclosed find $10 for one share of stock. S. MANSFIELD, Wappinger's Falls, N. Y.

May your noble efforts be the means of blessing many, many thousands more than have been yet reached. I inclose $20 for two shares. (Rev.) JOHN NOON, Amherst, Mass.

I am full of enthusiasm over the Revolution. I envy the man of his glory who organized the movement. He will be immortalized by the appreciative readers of good books. Inclosed find $10. I wish I could invest $100. J. F. DOBB, Martinsburg, Ohio.

I have taken great interest in your company ever since its first publication, and think it a wonderfully good thing. I send you $30. WM. H. GOVE, Salem, Mass.

I cordially accept your proposal and will take ten shares, for which I inclose $100. CHARLES CLARK, Greenville, Ill.

You are doing a grand work. Inclosed find $10. I wish I could take more. I find your paper a perfect gem. B. F. LEGGETT, Concordville, Penn.

It seems to me you have already done more to disseminate good reading, among a class of people who stand most in need of it, than all the rest of the book firms in the country. Inclosed find $10 for one share of stock. CHAS. E. UTTER, Cuba, N. Y.

Your circular offer of stock is too tempting with privileges attached, and here is $10. I think your proposition is a "hit." (Rev.) S. M. FREELAND, Thomaston, Conn.

I have from the first felt a deep interest in your enterprise of giving good books to the millions, and, as you offer shares to the public, would like to subscribe for five shares, and inclose check for $50. Prof. EDWARD D. RUGGLES, Dartmouth College, N. H.

Have concluded to risk $20 in the Literary Revolution. So long as you continue to publish good books, shall be glad to help by increasing circulation of your books, and by helping to furnish necessary capital. C. L. MCCRACKEN, Thompsonville, Conn.

I am very glad to identify myself more closely with the great work the "A. B. E." is doing. I inclose $10 for stock. (Rev.) W. H. BULKLEY, Stepney Depot, Conn.

You are a brick to furnish cheap reading, so send me "Light of Asia" and "Manliness of Christ." Sorry I can't quite yet afford "Library of Universal Knowledge;" come to it by and by. E. HALLENBECK, Davison, Mich.

Already your enterprise has effected a great change and accomplished a good work. May you have greatest success. The blessings of many are already upon you. I herewith send $10. (Rev.) E. H. YOCUM, Bloomsbury, Penn.

I have bought over thirty volumes of your publications, and have amassed a fund of literature which would have consumed the savings of two years had not your Revolution made it possible to buy books without missing the money expended. I inclose $10 for one share. JOHN L. THOMAS, Cumberland, Md.

STANDARD BOOKS.

The Library Magazine

Of American and Foreign Thought. Like the old and excellent Littell's Living Age and Eclectic Magazine, *without* the fiction and light literature (and with *American thought* added), at one-fourth their price, and *each number a bound volume*. Vols. I. to VI., nearly 4,000 pages, in cloth, for $2.50; in half Russia, gilt top, for $4.20.

Beautiful Homes.

The Art of Beautifying Suburban Home Grounds of small Extent. Illustrated by upward of 200 plates and engravings of plans for residences and their grounds, of trees and shrubs and garden embellishments. By Frank J. Scott. Price reduced from $5.00 to $3.00.

Books by Mail.

When books are sent by mail the cost of postage is charged in addition to the above prices—add for this purpose about 20 per cent to the price of books in cloth, 15 per cent to the price of books in half Russia.

Terms to Clubs.

In places where no bookseller acts as sole agent, terms to clubs are allowed as follows: 10 per cent discount on 5 copies of one book, or on 10 copies selected from the list; 15 per cent discount on 10 copies of one book, or on 25 copies selected from the list.

Terms of payment, invariably cash with the order—to millionaire and school-boy the same. Remit by bank-draft, money-order, registered letter, or by express. Fractions of $1.00 may be sent in postage-stamps.

Agencies.

Boston, H. L. Hastings; Philadelphia, Leary & Co.; Cincinnati, Robert Clarke & Co.; Indianapolis, Bowen, Stewart & Co.; Cleveland, Ingham, Clark & Co.; Toledo, Brown, Eager & Co.; Chicago, Alden & Chadwick, 221 State street; San Francisco, Cunningham, Curtiss & Welch; St. Louis, S. Paxson & Co.; in smaller towns the leading bookseller, only one in a place.

PERSONAL ITEMS.

Governor-General Lorne cost Canada $165,000 last year.

Senator Edmunds is said to have saved $250,000 from the proceeds of his law practice.

Queen Victoria has placed Osborne Castle at the disposal of the Ex-Empress Eugenie.

Mr. A. H. Stephens's colored body servant, Harry, who died the other day, was worth $20,000

Mr. Hiram Sibley, of Rochester, N. Y., owns four hundred farms in New York, Michigan and Illinois.

During General Garfield's Presidential term Mrs. Garfield's brothers will take charge of the Mentor farm.

Miss Lizzie Sargent, daughter of Ex-Senator Sargent, of California, has been admitted as a member of the medical profession in San Francisco.

U. S. Minister Hilliard is said to have been robbed of $5,000 in money, his watch, jewelry and clothing in Rio de Janeiro, Brazil recently. The robbers gave him chloroform.

Desperate Cases.

Many of the cases which come to us for treatment by Compound Oxygen are of a class which no physician of any school would undertake to cure. They are, in fact, such as have run the gantlet of experiment within the regular schools of medicine, and of quackery without, until between disease and drugs the patient is reduced to the saddest and most deplorable condition, and one for which relief seems impossible. No curative Treatment can be subjected to a severer test than is offered in these cases. And yet, in many of these, the most brilliant results have followed the use of Compound Oxygen. A record of some of these cases will be found in our Treatise on Compound Oxygen, which is mailed free. DRS. STARKEY & PALEN, 1109 and 1111 Girard Street, Philadelphia, Pa.

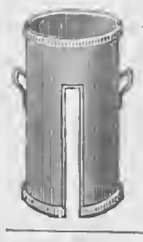
HEEBNER & SONS, Lansdale, Mont. Co., Pa.

SAVED 5c. per bushel on CORN and 20c. on WHEAT *can positively be saved.* For Illustrated Pamphlet, giving full particulars, address The Thomas Harrow Co., Geneva, N. Y.

MATTHEWS' SEED DRILL
The standard of America

Admitted by leading Seedsmen and Market Gardeners everywhere to be the most perfect and reliable Drill in use. Send for circular. Manufactured only by
EVERETT & SMALL, Boston, Mass.



LINCOLN PATENT
CHANNEL CAN CREAMERY.

Deep setting perfected. Gets all the cream in less than ten hours, with ordinary well or running water, or in two hours with ice water, with less than half the ice called for by any other process.
AGENTS WANTED. Send for Circular to **WM. E. LINCOLN,** Warren, Mass.

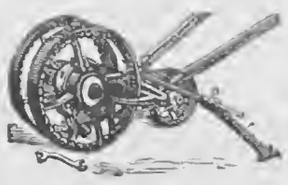
Rectangular & Square **BOX CHURNS**

Cheapest and Best.—No inside fixtures, and *always reliable.* Six sizes of each kind made. Three sizes of the Lever Butter Worker made. Best material used, and every Churn and Butter Worker warranted exactly as represented. One Churn at wholesale where we have no agent. Send postal for Circulars.
CORNISH & CURTIS Fort Atkinson, Wis.

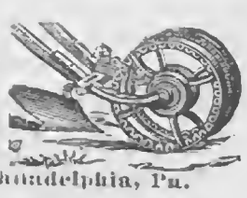
SPECIALTIES.
Agricultural Implements,
FOR WHICH
WE WANT LIVE AGENTS.
The Charter Oak Swivel Plow.
The Higganum Chilled Plow,
The Hughes Castor Tooth Harrow, the best Smoothing Harrow in the World.
THE MONITOR SELF-DUMP RAKE.
Hollingsworth Patent.

Do not fail to write for Circulars.
HIGGANUM M'F'G CORPORATION,
Higganum, Conn. U. S. A.
Manufacturers of Agricultural Implements of every description.

THE PLANET JR. GOODS.



Let every man, woman, and child whether interested much or little in working the soil, send now for our carefully written Catalogue. We want all farmers who value labor-saving tools to study out our combined Horse Hoe, Cultivator and Coverer; Market Gardeners, who have acres upon acres on each of which our Double Wheel Hoe will *save its cost* yearly, to examine the merits of our fine garden tools; and every one who has even a small vegetable garden to read closely what the Firefly Hoe and Garden Plow will save them. **S. L. ALLEN & CO., 229 Market St., Philadelphia, Pa.**



ASK FOR
Wells, Richardson & Co's
PERFECTED BUTTER COLOR
It Gives Butter the gilt-edged color the year round. The largest Butter Buyers recommend its use. Thousands of Dairymen say **IT IS PERFECT.** Used by all the best Creameries. Awarded the International Diploma at N. Y. Dairy Fair. Ask your druggist or merchant for it; or write to ask what it is, what it costs, who uses it, where to get it. **WELLS, RICHARDSON & CO., Proprietors, Burlington, Vt.**
USE ONLY THIS THE FIRST AND THE BEST

The Beginning of the End.

The beginning of disease is a slight debility or disorder of the vital organs, the stomach, the liver or the bowels usually. There are dyspeptic symptoms, the liver is troublesome, the skin grows tawny and unhealthy looking, there are pains in the right side or through the right shoulder blade. The climax is often an utter prostration of the physical energies, perhaps a fatal issue. But if the difficulty is met in time with Hostetter's Stomach Bitters, which is always effective as a remedy, should be resorted to at an early stage, there will be no reason to apprehend those injurious subsequent effects upon the system often entailed by entirely cured diseases. Far better is it also, to employ this safe remedial agent in fever and ague, and other malarial complaints, than quinine and other potent drugs, which, even when they do prove effectual for a time, ruin the stomach and impair the general health.

NEW FRUIT AND ORNAMENTAL TREES

Besides the largest and most complete general stock of Fruit and Ornamental Trees in the United States, we have the pleasure to offer the following **Choice Novelties: APPLES.**—Red Bietigheimer, Stump, Sutton Beauty. **PEARS.**—Souvenir du Congres, Petite Marguerite, Ansault. **PEACHES.**—Waterloo, Conkling. **GRAPES.**—Monroe, Rochester, Lady Washington. **STRAWBERRIES.**—Sharpless and others. Also, the best new Deciduous Ornamental Trees and Shrubs, Evergreens, etc. We always secure the best novelties at home and abroad, and all who intend to plant should not fail to consult our Catalogues, which contain full descriptions of all the new and old fruit and ornamental trees worth having.

Priced Catalogues sent as follows: No. 1, Fruits with plate, 15 cts.; plain, 10 cts. No. 2, Ornamental Trees, etc., with plate, 25 cts.; plain, 15 cts. No. 4, Wholesale, **Free.** No. 5, Catalogue of Roses for 1881, **Free.** No. 7, Catalogue of Strawberries and Small Fruits, **Free.**

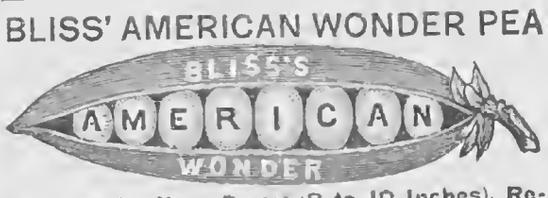
BLISS' AMERICAN WONDER PEA



Extra Early, Very Dwarf (8 to 10 Inches), Requires no Bushing, Exquisite Flavor.

Acknowledged by all to be the best and earliest Pea grown.

Editor of American Agriculturist says: "Very early, productive and good; quality not to be surpassed."

CAUTION.—As there is another Pea in the market called "American Wonder," send to us and get the genuine Bliss' American Wonder. Observe our fac-simile on every package.

Prices.—One-fourth pint package, 20 cents; pint, 65 cents; quart, $1.25; by mail, post-paid.

Our Novelty Sheet, giving full particulars, mailed free.

ESTABLISHED 1845.

300 BEAUTIFUL ILLUSTRATIONS,

With a richly colored plate of a Group of Pansies, and a descriptive priced list of 2,000 varieties of FLOWER and VEGETABLE seeds—with much useful Information upon their culture—150 pages—mailed to all applicants enclosing 10 cents, which can be deducted from first order for seeds.

Address, **B. K. BLISS & SONS,** 34 Barclay Street, New York.

CUTHBERT RASPBERRY

Of this incomparable variety I have much the largest and best stock in the Country. A large stock also of **GREGG,** Turner, Herstine, Franconia, Caroline, Reliance, Brandywine, etc.

IS NOW READY. **40 Pages; 75 Illustrations. HONEST DESCRIPTIONS: FREE TO EVERYBODY.**

Lovett's Small Fruits are the best in the country, and are sold at the lowest possible prices at which plants can be properly grown and shipped. The Catalogue tells how to get and grow them; gives also a full list of the finest **Large Fruits** and **Select Ornamental Trees & Plants. 35 New Strawberries, 10 New Grapes. New Hybrid Pears,** New Raspberries, New Blackberries, etc. Send for it at once.

J. T. LOVETT, Little Silver, N. J.

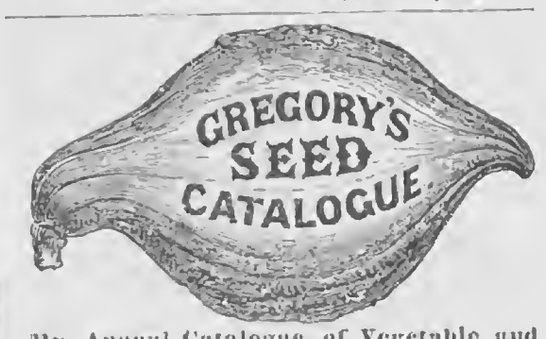
SEEDS

We will send our Catalogue for **1881** Containing a full and descriptive list of **FLOWER SEEDS, VEGETABLE SEEDS, Gladiolus, Lilies, Roses, Plants, etc.,** *beautifully illustrated with colored plates,* **free** to all who send their address. Application may be made to 179, 181, and 183 Main Street, Rochester, N. Y. or 174 E. Randolph St. Chicago, Ill.

HIRAM SIBLEY & CO.
ROCHESTER, N. Y. & CHICAGO, ILLS.

Will be mailed FREE to all applicants, and to customers without ordering it. It contains five colored plates, 600 engravings, about 200 pages, and full descriptions, prices and directions for planting 1600 varieties of Vegetable and Flower Seeds, Plants, Roses, etc. Invaluable to all. Send for it. Address,

D. M. FERRY & CO., Detroit, Mich.



My Annual Catalogue of Vegetable and Flower Seed for 1881, rich in engravings from photographs of the originals, will be sent FREE to all who apply. My old customers need not write for it. I offer one of the largest collections of vegetable seed ever sent out by any seed House in America, a large portion of which were grown on my five seed farms. *Full directions for cultivation on each package.* All seed *warranted to be both fresh and true to name;* so far that should it prove otherwise, *I will refill the orders gratis.* The original introducer of the Hubbard Squash, Phinney's Melon, Marblehead Cabbages, Mexican Corn, and scores of other vegetables. I invite the patronage of *all who are anxious to have their seed directly from the grower, fresh, true, and of the very best strain.*

NEW VEGETABLES A SPECIALTY.

JAMES J. H. GREGORY, Marblehead, Mass

$350 A MONTH—AGENTS WANTED—75 best selling articles in the World; 1 sample *free.* Address JAY BRONSON, Detroit, Mich.

TRY IT ONCE, and you will esteem it highly as a safe and effective remedy.

A MEDICO-FRUIT LOZENGE OF THE PREMIER CLASS.

TROPIC FRUIT LAXATIVE

Prepared from tropical fruits and plants.

Is the Best and Most Agreeable Preparation in the World

For Constipation, Biliousness, Headache, Torpid Liver, Hemorrhoids, Indisposition, and all Disorders arising from an obstructed state of the system.

Ladies and children, and those who dislike taking pills and nauseous medicines to secure cathartic action, are especially pleased with its agreeable qualities.

Packed in Bronzed Tin Boxes only.

Price 25 Cents. Large Boxes, 60 cents.

SOLD BY ALL DRUGGISTS.

HENDERSON'S

COMBINED CATALOGUE OF

SEEDS AND PLANTS

Will be Mailed Free to all who apply by Letter.

Our Experimental Grounds in which we test our Vegetable and Flower Seeds are most complete; and our Greenhouses for Plants (covering 3 acres in glass), are the largest in America.

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

Ralph Evans

Vol. XL. No. 8. Whole No. 1621. | NEW YORK, FEB. 19, 1881. | Price Five Cents, $2.00 Per Year.

[Entered according to Act of Congress, in the year 1881, by the Rural New-Yorker, in the office of the Librarian of Congress at Washington.]

The Herdsman.

CLOSE BREEDING.

BY A. STOCKMAN.

Mr. Talcott does me great injustice, when, in his communication (page 84), he says my replies "are shifts to avoid a direct answer in one way or another." He says he asked the question "how many, and where, are the descendants of Duchess, for information. I did not so understand him, but knowing that this is a stock question put by the opponents of what is called close breeding, as a sort of knock-down argument, a "sockdologer" in fact, which finishes up an opponent and lays him out sprawling, I took it in that sense, and declined to be laid out by it. Now Mr. Talcott says he asked for information only. I don't think he requires any information, as he probably knows enough of the present history of Short-horns to satisfy himself that what I have said of this noted family of them is perfectly true. If he knows nothing of it, he should not have written in the manner he did and tried to convey a distinct impression that the Duchesses have gone to the "bow-wows" because of their too close and faulty breeding. If he knows all about it he cannot ask for information. But I don't want to discuss this matter in any but the kindliest spirit with Mr. Talcott—for whom I have great respect—and in the broadest spirit both as to the simple statement I originally made and as regards the family of Short-horns brought into dispute.

It is taking a narrow view of this very important question to confine it to the breeding of this particular family. I did not. I referred to Mr. Bates's breeding generally, not to this one particular strain, and object strongly to the attempt made by Mr. Talcott to deprive me of the broad ground on which I placed myself, and to drive me into a supposed corner, and then to try to shut me in that corner by confining me to the narrowest line of "the Bates Duchess family," and ignoring all the branches of the family. I claim that a line of breeding is to be judged by its full effects, and not by the condition of a particular family, from which the breeder made his chief reputation. Looking at the Duchesses in this light, all the offshoots of that family should be taken into account, and not only the direct line of it. Besides, Mr. Bates left the Duchesses in very good shape at his death and with the highest reputation among Short-horns, and whatever may have happened to them since then—if they had become extinct even—should not be laid to his charge or to the charge of his system of breeding. It is true he left but 14 head, all told, of this family; but they were certainly the best Short-horns in existence then and sold for the highest prices under adverse circumstances. Four of the Duchesses anyhow were good enough to be brought to America a few years afterwards at what were then extreme prices.

But the family have by no means become extinct and have yet a reputation to be proud of. It is a very short time since (1877) two of them were sold from Hillhurst at 4300 and 4500 guineas, about $22,500 and $23,600, to go to England, and the man who bought them was no fool. Notwithstanding there have been but few crosses on this family, there are nearly 40 Duchesses in England, and some are still left on this side of the water in spite of the desire of English breeders to possess them. The reason why Mr. Bates left so few at his death, I might say in reply to Mr. Talcott's question (which I don't want to avoid in any way) is that that gentleman bred his Short-horns for reputation; it was a passion of his and he gave his life and work to it. Desirous of proving the wisdom of his method, he, doubtless, as many other breeders have done and do, fed and slaughtered every animal that did not come up to his ideal. That he would sell any inferior animal is not to be supposed for a moment or that he would keep one for breeding. If money making was his business, he might have done that. But it was not, and his success cannot be doubted although there are persons now who think they could have done better with his stock than he did, and could have taught him some things about breeding.

But all this is wide of the point I wished to make, which is, that under certain circumstances, close breeding is not only advisable but absolutely necessary to fix a type of character that may be desired. I know this is a disputed point among breeders. I may be wrong and Mr. Talcott may be right. I may be prejudiced, but I don't think it, for I can change an opinion when I see that I have been wrong. But I see nothing to weaken my faith. Not even the defects of the Duchesses have this effect; their "shy breeding;" their "constitutional weaknesses" and other faults so charged by their adversaries, but not admitted by their friends, and not very apparent to me. On the contrary, I consider that the Duchess family has not only added directly a vast amount of money value to our live stock; but that its example has indirectly greatly stimulated the best methods of breeding by other stock breeders and has thus largely added to the wealth of the world. But Mr. Talcott has no right to pick out the Duchesses as his "frightful example" of what he considers injurious breeding, nor to found his objection to Mr. Bates's system of breeding solely on his disparagements of this family, or their failure since Mr. Bates's death to come up to his, and other judges', ideas of excellence. I would offer as encouragement for breeders of the present day (in reply to his question again) not only Mr. Bates's success with the Duchesses, but with his other families, and as well the success of other noted breeders. Goldsmith's Maid might be mentioned as an example of close breeding and she has shown no want of vigor or power in consequence. She is all Messenger blood on both sides except one cross of Bellfounder in the grandsire and both her grandsire and dam were sired by Abdallah. Mr. Atwood's renowned flock of Merinos were bred from one sire, and he never used any but pure Humphrey rams; and the Humphrey flock was close bred. Mr. Hammond bred his flock in-and-in and never went outside of it. His noted ram Gold Drop, for which $25,000 was offered and refused, was full of "old black" blood; and his dam Old Queen was the granddam of his sire and consequently his own great grand dam, and Sweepstakes was the sire of both his sire and his dam; for his dam Beauty was by Sweepstakes out of Old Queen, and his sire California was by Sweepstakes out of Beauty his own daughter. The history of the best and most successful stock breeding is full of such examples and yet Mr. Talcott finds fault with me for complaining that the great bugbear of farmers is close breeding. It is only because they are uninformed of the facts. But Mr. Talcott is informed and therefore if he sins at all it is against light. Now I ask Mr. Talcott to give us some examples on his side as illustrious as those I have given, and not to "make any shifts to avoid giving a direct answer."

IN-BREEDING DISCUSSED BY A BREEDER.

Practical Lessons and Suggestions.

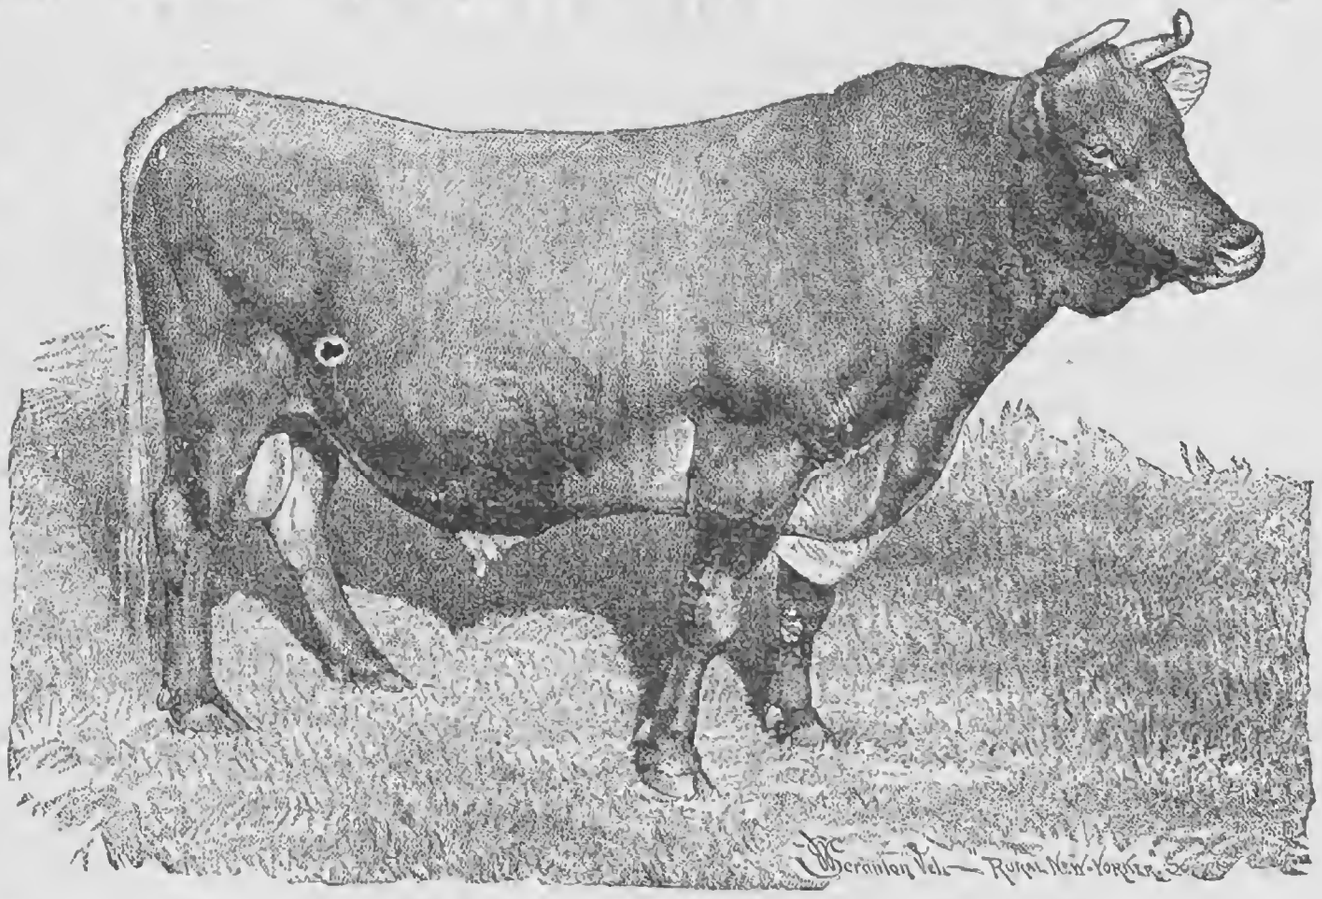
COL. F. D. CURTIS.

The discussion between "Stockman" and Mr. Talcott is interesting, because both are right and both may be wrong. "Stockman" is right when he asserts that both cattle and sheep have been improved by in-breeding. This is the way that all improved breeds of these animals have been brought to perfection, and those special types of the breeds or families have been established. There is no other way in which it can be done. We are now engaged in forming a family or special type of Jersey and Ayrshire cattle by the in-breeding system. A valuable Jersey cow, "Princess Caroline," is being crossed by her own offspring, in order that her characteristics may be thoroughly established in her descendants. She has been bred to her son, and we intend to follow this line of in-breeding until a family and a race of "Princess Carolines" shall be established. In this way we expect to perpetuate not only her form, which is a perfect model of a cow, but other points of excellence. An out-cross with another family would introduce other features, not so valuable, in our judgment, or, at least, destroy the *intensity* of the blood, which is one of the constitutional qualities which we expect to incorporate in it. This intensity of blood or thoroughbred principle is what gives a thoroughbred its value, and just so far as it is established the thoroughbred is superior to the cross-bred, either of breeds or families. We are also trying to establish a perfect family of Ayrshires by breeding together the offspring of the cow "Polyanthus." A son of "Polyanthus" has been used as the sire, and a son of this union will again be used as a sire. So far there has been no evidence in either of these experiments of a want of constitutional vigor, but there is a decided similarity in type and characteristics.

It is true, as "Stockman" remarks, that the most successful breeders of sheep in England have perfected them by in-breeding. The same system has been practiced by the Merino breeders in this country, and in no other way have they attained success and established the different families of improved Merinos. In France the same law has governed the Merino breeders, and the famous French Merinos owe their pre-eminence to careful in-breeding.

Pigs will not bear close in-breeding. They will rapidly degenerate. They may be in-bred for two or three generations of blood relation, but beyond that it cannot be carried without physical weaknesses. An out-cross of new blood will correct these deficiencies, but at the same time change the type and destroy the thoroughbred principle. Thoroughbred breeds of pigs can only be established by having a number of families similar in blood and characteristics, but of sufficiently remote relation to admit of being bred together. An in-and-out crossing of these families must be frequently made to keep up the standard and prevent degeneracy. No doubt the same rule would improve the constitutional vigor of cattle or sheep, if it could be carried out as readily with them, but as their posterity is more limited, it is not so easily done.

Breeding to improve stock is an intricate work, and requires not only close observation, coupled with careful study, but a great deal of experience. The theorist will find himself baffled frequently, and any one is liable, even with years of effort, to signally fail. Americans have always been in the way, with very few exceptions, of depending upon Great Britain for their improved animals, except, perhaps, Merino sheep and trotting horses; and a great deal of money has crossed the Atlantic for thoroughbred stock which should have been produced on this side. This want of confidence in ourselves should give way, as a matter of economy and as a basis for inspiration for American farmers, to a determination to improve the native stock, and also to improve the thoroughbred animals which we already have. It is an unpatriotic, if not a senseless idea, that American farmers should be dependent upon foreign breeders, or that foreign stock should out-sell home-bred. We hope to see the day when American-born thoroughbreds shall out-rank, in fashion and in price, imported.



JERSEY BULL, STOCKWELL 3d.—Fig. 87.

Advantages of Polled Cattle.

Polled cattle are so uncommon that they are considered unsightly in appearance. But if the case were reversed and horned cattle were rare, then these would appear equally odd; and the question might arise, do not horns mar their appearance? They certainly have no utility and are often so ill-shaped as to destroy the animal's beauty, and when broken or torn off, which is frequently the case, they

are painful to the sight. Polled cattle are to be commended because they are not dangerous to each other or to those having them in charge. Cattle with horns are constantly liable to gore each other and to produce abortion, which would not happen if they were deprived of horns. They can be confined closer together, thus economizing space, and are proverbially more quiet and tractable in their nature. They cannot throw down fences, as they have no levers (horns) with which to displace rails or to push them over. On this account a slight fence is sufficient to keep them in subjection.

A hornless bull would never endanger life, a peril too often caused by others. This consideration is an argument in their favor paramount to all others, and gives them a great value, as severe injuries and frequent loss of life occur with horned bulls.

They could never be accused of having "horn-ail," and the barbarous practices of the "cow doctor" could not be inflicted upon them. They would fatten more readily as, lacking the weapons for attack and defense, they would not be inclined to fight either in play or in earnest, and thereby decrease their growth, owing to excitement and severe exercise. With all these advantages polled cows are fully as good as horned for milk. F. D. C.

OUR PRIZE ANIMALS.

Jersey Bull Stockwell 3d.

We present the readers of the RURAL with the spirited engraving of this famous bull, with the feeling that it is a credit to photographer, artist and all concerned. One rarely sees so characteristic and excellent a picture of an aged Jersey bull, and it is seldom indeed that an artist has so good an animal to portray.

Stockwell 3d was bred by John C. Godfrey, of St. Saviour's Parish, Jersey, and dropped in 1873, his sire and dam being of the registered Foundation Stock of the Island. He was imported by his present owner, Hon. Erastus Corning, of Albany, at the head of whose herd he has long stood. He is of a solid gray, fawn color, rather dark, the spots which appear white in the engraving are so only in contrast to dark surroundings, and because they are in a strong light. He is exceedingly fine in bone, head and horn, very level above and below, extremely deep and thick through the heart, indicating the grand constitution possessed both by him and by his get. His hide is soft and plastic and his coat like broadcloth. He has been exceedingly fortunate as a prize winner, having won the highest honors wherever shown, and at the last State fair, where he was photographed for the RURAL, winning *first* and heading the prize herd. See first page for illustration.

Dairy Husbandry.

THE DAIRY COW—NO. 25.

HENRY STEWART.

Breeding Dairy Cows.

A DAIRY cow is an artificial production. The original cow was merely the mother of the calf and when the calf was able to eat and digest grass the maternal functions of the cow ceased. But when the cow became subservient to the purposes of the dairyman the maternal function was only a part of her business. It was necessary to produce calves to continue and increase the stock; but the cow was made a machine, not only for the production of an improved progeny, but also for the production of milk and butter. She was then necessarily brought under the strictest discipline in regard to breeding for both these purposes, so that her progeny should be made to serve the purposes of the most exacting dairymen. By many years of careful breeding the dairy cow has become a wonderful animal. Her milking capacity has become increased until she is able to rear or feed four or five calves in the year in place of one, and many cows are regularly used for this purpose only, another calf being given to each as soon as she has reared one to weaning age. Her capacity for producing butter has been developed to a still larger degree, for it is by no means uncommon for one of the best class of cows to give in a season a weight of butter almost equal to her own, and some cows have even equaled their own weight in a year. This has been done by a process of long-continued, skillful breeding, by which the character of the animal has been greatly changed in every respect—in form, in digestive and assimilative power and in secretive capability, so that the present well-bred dairy cow is made to concentrate all her vital force upon the consumption, digestion and assimilation of food, and upon the extraction from it of as large a portion as can possibly be turned to the production of milk and butter, and not only this, but her whole physical structure has been remodeled that it may serve the end in view in the best manner.
